ROD AND GUN IN-CANADA

JUNE 1919

FIFTEEN CENTS

NIMROD

G. TAYLOR LTD. PUBL. W. H. LLOYD

THE HERCULES ROD.

Westwood's Patent Unbreakable Silk Bound Split Cane Rod, 9 feet, 5 oz.,
The Patent Dark Green Silk Binding adds greatly to its beauty, as well as increasing its strength some fifty per cent. This Rod has become a great favorite for Trout and Bass Fishing.

Hercules Trout Rod, 9 feet, 5 oz., each	\$20.00
Hercules Bass Rod, with four Agate Rings, each	25.00
Expert Silk Bound, medium quality, made in Trout and Bass, each	10.00
Excell. Silk Bound, fair quality, in Bass or Trout, each	6.00

THE UNEQUAL ROD.

Westwood's Patent Silk Bound Steel Rod, Trout, 10 feet.
This Patent Dark Green Silk Binding protects this rod absolutely against rust, besides adding greatly to its strength and beauty.

Trout Rod, 10 feet, each	\$ 7.50
Bass Rod, 5 to 9 feet, each	7.50
Bait Casting Rod, 5 to 5½ feet, with large German Silver Rings, each	8.00
do. do. with one Agate End Ring	10.00
do. do. with Agate Butt and End Ring, each	12.00
do. do. with all Agate Rings, each	14.00

THE BLAKE ROD.

Trout Rod, each	Highest Grade Split Cane Trout Rod, 9 feet, 5 oz.	\$16.00
Bass Rod, 8 feet, each		16.00

For a first class Rod it cannot possibly be surpassed and is in great demand.

The Old Home Haunts

F. R. Stock

There's a sound that rings in my ears today,
That echoes in vague refrain,
The ripple of water o'er smooth-washed clay,
Where the wall-eyed pike and the black bass play,
That makes me yearn, in a quiet way,
For my old fly-rod again.

Back to the old home haunts again,
Back where the clear lake lies;
Back through the woods
Where the blackbirds brood,
Back to my rod and flies.

I'm longing to paddle the boat today,
Through waterlogged grass and reeds;
Where the muskrat swims, and the cat-tails sway;
Where the air is cool, and the mist is gray;
Where ripples dance in the same old way,
Under the tangled weeds.

Back to the old oak log again,
Back by the crystal brook;
Back to the bait,
And the silent wait,
Back to my line and hook.

I wish I could wade by the water's edge
Where the fallen leaves drift by,
Just to see, in the shadow of the ledge,
How dark forms glide, like a woodman's wedge.
Through driftwood piles and the coarse marsh sedge,
And to hear the bittern cry.

Back where the tadpoles shift and sink,
Back where the bullfrogs sob;
Back just to float
In the leaky boat,
Back to my dripping bob.

Oh, it's just like this on each misty day,
It's always the same old pain
That struggles and pulls in the same old way
To carry me off for a little stay
By the water's edge, in sticky clay,
To fish in the falling rain.

Back to my long black rubber boots,
Back to my old patched coat;
Back to my rod.
And the breath of God—
Home—and my leaky boat.

No. 1

GEORGE GILBERT

TIME to turn out, dadburnie you," said John Aylesworth to himself. "It's Monday; time to begin your real work here."

But he did not heed that self-advice—then. Instead, he flopped down more cosily still under the good, rough, heavy blankets in his trapper's shack on the Nescopern, joying to think that his camp was pitched where he would have plenty of wood, easy to chop, to his hand. Also that he had been able to get his supplies in from Stratho, his out-fitting point, not a moment too soon to be ahead of the first snows. As he had gone to bunk the night before, after packing in his last load from the

canoe landing, he had heard the big flakes spat-spat-spatting against the tiny window at the east end of his shack. So he had gone to sleep to the mighty threnody of blasts carrying the myriads of "white bees" before them. Now, at ease, he could see flake after flake come against the window, but softly, as the wind had blown itself out in the night through the passes of Netagomish, using the vale of Otter Creek, from mouth to source, as the trough through which it had poured its especial fury upon the highlands in between Rainbow River and the Netagomish barrier.

"Silver Dale," from its sheltering clumps of white birches, Aylesworth

had named his camp site and the adjacent territory.

Otter Creek was then making music out under the bank in front of Aylesworth's shack, but the music was muffled, as if the creek already felt the grip of winter and the need for husbanding strength against the mighty efforts that it would be called in the coming spring months, to do its share toward ridding the land of the debris of a dead winter.

The creek's sources were on the western slopes of Netagomish, whence it flowed in rambling course almost west to Rainbow River, that had a trend north and south. Almost due north thirty miles from where Otter Creek made into the river, Stratho was going to sleep for the winter, after the summer and fall labor of caring for the needs of the "summer folks," fishermen, hunters. The Nescopern, east of the river, was barren, rocky, primitive. But back of it, between it and the foot of Netagomish, was the great expanse of Muskrat Marsh and between the marsh and the mountains good trapping territory, as Aylesworth had discovered during his Sunday tramps all about there, during the summer in between the periods he had devoted to guiding trout fishers or in the fall when he had guided deer hunters. Now the outsiders had gone, the big woods were quiet. That meant that the habitants could go and come without fear of being shot, in mistake for deer; could log it, trap, hunt, fish, dance, eat, drink and be merry after their kind, without fear of being asked to take some stranger fishing, for a consideration, or to take him hunting—for another.

"Get up," Aylesworth was ordered by one with power to attract his attention, if not to compel obedience.

A cold nose was thrust against the trapper's cheek, and a gentle "woof," sounded in his ear.

"Git out, old Snoozer," the would-be sleeper ordered, playfully whacking the Airedale's pointed muzzle aside.

But Snoozer thrust his nose back into the desired position again and finding that that had no effect, gently nipped his master on his right ear

that he nuzzled out of its hiding place under the upturned blankets.

A mighty heave sent Snoozer, blankets and all out onto the middle of the shack's floor. As the dog scrambled out of the tangle of woollen folds, a pillow made of a gunny sack's end and stuffed with balsam buds—best of all pillows—hit him squarely and knocked him over. Then, with a whoop, Aylesworth slammed out of the shack, Snoozer joyfully following, across the few steps of snow covered ground and to the creek, where he chucked his last protection against the cold—a light blanket. He took one plunge off the log jam that spanned the creek's big pool there, came up spluttering, swung himself onto the jam, draped the blanket about him, and with Snoozer snapping at the fluttering ends, raced for the shack door. Inside, red and tingling from his contact with cold air, water and snow, he fairly snatched his clothing on and in two minutes stood over the sheet iron stove, humming a little tune to himself. Spoozer watched him, anticipating benefits to come when the morning meal would be ready and he would be invited to have a bit from his master's plate to supplement the quarter of raw rabbit that he already had devoured, after being served with it by his best friend.

"You old Snoozer boy," Aylesworth said, as he sat down to bacon, flapjacks, syrup, beans and coffee, guess that may be the last swim for this year in the creek. Today we're going out on the scout to get our trap lines located for real business, you old ringtailed cinerarium, you. Hear that? I think we'll go up the Muskrat Marsh and to its head."

Snoozer, his head cocked now on one side, now on the other, listened. He whined, maybe because he understood, maybe because he wanted that last flapjack, soaked in bacon grease from the fry-pan. After he had the flapjack cached in his department of the interior, he raced around after his tail a few times, watched his master buckle on his belt, hang his "meat gun," a long barreled .22, onto its holster, put

his trail axe in its place on the other side of the belt, stow away tobacco and pipe inside his flannel shirt front, take up and put away a few slices of bacon, salt, pepper, tea and sugar in a two-quart pail, then put on his "ear-warmer" cap of red fox fur, his heavy mackinaw and lastly his lined fur gloves. Then Aylesworth pulled three dozen small steel traps out from under the bunk, swung them onto his back, opened the door to Snoozer's joyful barking, gave a glance at the clearing skies, from which some snow still sifted between the cloud rifts, smiled as he saw a rosy glow on Netagomish that told him the sun was boring a hole through the storm over there, made sure that his canoe was safe under the low hemlocks beyond the cabin, where he had concealed it after toting it up from Rainbow the afternoon before, and started off from the angle the creek made there, toward the marsh.

For all the fury of the storm's breath, the snow was only about eight inches deep. It might be gone in a day or it might be added to, by storm after storm, and stay until spring. The snow was virgin—not a track was to be seen on it—the wild folk having all kept in during the night and not having yet ventured forth to slay or be slain—to eat or to be eaten. Snoozer knew this as well as did his master, for he trudged at Aylesworth's heels along the banks of the little trickle that came from the marsh's foot to the creek.

Here and there Aylesworth set a trap in the tiny stream's bed, where signs showed him mink had passed up or down. Here he made a water set by hanging a muskrat ham on a twig over the water, with the trap buried lightly in the silt right under the bait. There he put a trap beside a rock that stood at the edge of a little pool, placing a piece of log in such a way that a passing mink would suspect it and sheer away from it to the supposed safety of the unmoved rock and so be taken. The dog, well instructed in trapper's lore, kept away from the jaws that could cause so much misery and made

mental note of the signs nearby, so he would not blunder into danger there later.

At the trickle's head Aylesworth found the dug-out canoe he had made during the summer and lodged at the marsh's foot against his present hour of need. This rude but serviceable craft would serve him in getting about the marsh until it froze. Then it would serve as a sledge, in which he could haul much weighty materials over the ice, from end to end of the marsh. Runners for it, for such a use, he had made, tucked away in the dug-out, ready to be attached.

At a word, Snoozer leaped into the dug-out. Aylesworth took the paddle, after disposing of his traps and crouched down for the effort of forcing the craft through the sedges and flags that still carried their burdens of snow.

The water, with here and there ice-needles showing in the steaming open spaces how nearly it had gone to freezing, was still. The wind had gone. The sun now began to peep over Netagomish into the valley between the mountains and the Nescopern. A late loon came up and laughed beyond. A few crows in far-away pines chaffed at a surly owl. From his hole in a nearby beech a red squirrel quarreled with the world.

The board paddle, wielded by Aylesworth's strongly muscled arms, sent the dug-out north, close to the eastern marge of the marsh.

On that side the ground sloped easily and there was a fairly wide space between the water's edge and that woods that was flat-white now, but that later would show its tracery of many trails when the woodland's denizens recovered from their first fright at the sight of the first snow of the new winter.

So crouched, paddle plying, Aylesworth made an attractive figure of easy strength and vivid vitality. His snappy black eyes held in their depths and about their corners tokens of gladness. His red fox fur cap, pushed back now from his curling black foretop of intensely lustrous hair, became him well. Every mo-

tion of his body gave proof of vigor, warmth of body, while the careful way he made each stroke tell told of cool-headed brainpower. The cold air allured him—filled him with happiness. Just past twenty five, clean-shaven, alert, thinking nothing of lonely vigils and tramps, with a conscience that permitted him to live alone for months at a time without being tired or ashamed of his own company, the North Woods trapper was typical of a large class—the Brethern of the Trap Line. He was just above the medium height, compact, stocky, without an ounce of fat.

Here and there on the marsh Aylesworth located rat houses, made conical and secure by the busy inmates. He set traps by the margin, potted a rabbit that he saw under a root curl on shore and sent Snoozer after it. Farther on he killed a hawk on the wing. And once, for the sheer joy of the effort he got out on the shore and ran Snoozer a race, just to feel his legs tingle.

It was about noon when Aylesworth came to the upper end of the marsh, a good dozen miles from his own shack.

The day had cleared. The sun was making the snow glisten with a dazzling sheen. The snow on the marsh's tufts and sedges had melted.

CHAPTER II.

A breeze, from the south, was making little wavelets talk against the dug-out's stern whenever Aylesworth let it drift.

The higher marsh Aylesworth never had explored. His trips through the region never had led him that far. But he wanted to go over the ground now, to make sure that no other trapper was on that range.

At the farthest point to which he could drive his dug-out amongst the flags and sedges he found a tongue of dry land extending out to meet his boat's nose. This he accepted as a landing place and, the traps being all set, and he having nothing to carry but his pail with the food in it, Aylesworth, making sure that little axe and "meat-gun" were in

their places, drew the dug-out up onto the dry point, ordered the unwilling Snoozer to get in and make his bed in an armful of dry sedge grass that his master threw down in the craft for him and leaving the dog to watch, struck up the little creek that came into the marsh there.

Up this he went, sometimes slashing through the tag alders, sometimes on the bank on either side.

Soon he found himself in a pretty little vale, with low hills on either hand, Netagomish looming afar to the east.

Not a track did the trapper view as he pressed forward. The snow was not deep enough to make the walking unpleasant. He could see far ahead along the little watercourse.

After Aylesworth had traveled an hour the stream-bed deepened and he found himself walking with his eyes below the level of the bank on either hand. After minutes of that work, he came to a spot where a big hemlock curled its washed-out roots over the route he was taking.

Something red caught Aylesworth's eye amongst the root-curls. A glance told him it was the tail of a large red fox.

Startled, the trapper clambered up to the level of the dead animal and saw that it was the victim of a large steel trap, that had been set in a hollow of the tree's bole. The fox was dead.

"Mighty clever set that," Aylesworth thought, bending over to examine the signs. He saw where the fox had meandered down the hillside. A hole in the fox's head told of how a bullet had ended its struggles in the trap. And now he saw, his attention taken less with the dead fox, now that the seeming mystery of its being there was explained, the tracks of a human being, coming from up-glade, toward him. Evidently they had been made quite recently. He was turning his body to see if the tracks led below, also, when some one asked:—

"What you doing at my trap, Johnny Sneakums?"

Aylesworth started erect, his hand on the butt of his little gun, at the

insult. To call a Brother of the Trapline a Johnny Sneakum is to say that he steals pelts from the other man's traps. It is the fighting word. But the voice was that of a woman!

Aylesworth saw facing him a slender girl, about his own height, with deep brown eyes, rich chestnut hair. Her short skirt of brown, high-laced waterproof shoes, blue sweater, and mink cap that was snugged in warmly about her ears and that only left her cheeks partly in view, bespoke good judgment in outdoor dress. A very capable little rifle lay cuddled in the crook of her arm and in her belt was a small ax.

A flood of red color came into Aylesworth's cheeks. If it had been a man that was before him, lips still open after using that odious phrase! "I didn't know there was anyone else—"

"Well, there is. Dad and I have lines of traps all up and down Muskrat Glade and near the head of the marsh."

Her voice was clear and even. Aylesworth found himself thinking that if she were not angry that voice would have been of a very pleasing quality, although he caught a slight foreign accent in her tones.

"Well, then, I'll keep my trap lines below you," John said.

She fingered her capable little rifle a bit.

"Do you want me to skin the fox for you?" he asked. His astonishment over coming upon a pretty girl in the Big Woods in the edge of winter had not overcome his sense of obligation to the sex, even if she had insulted him with her epithet.

"No, thanks. Dad'll do that."

This with decision. She stepped forward, stooped, grasped the trap chain, gave it a few deft twists that unfastened it from the root to which it had been locked, and then swung the fox over her shoulder and strode off, back up the trail she had made coming to the trap.

"I want you to understand that I'm not Johnny Sneakum," Aylesworth called after her. She had outraged his feelings twice, once with

the epithet, once when she had scorned his assistance.

Trudge, trudge, trudge.

She was going away, seemingly without answering.

But she suddenly turned with:—

"Then keep away from my traps."

The rifle covered him.

Almost before Aylesworth realized it and long before he had thought of a bit of effective repartee, she had resumed her trudging.

"Just like a darn fool girl," Aylesworth confided to the nearest tree.

CHAPTER III.

He never had guided women, nor cared to be about with camping parties that had women in them even. He had the old fashioned American backwoods idea that women should keep out of the woods, unless it was for a berrying trip or a nearby outing. With the men he was popular; with such women as he had come into contact he was polite with a detached politeness that had in it the hint of lack of interest. Among his own people in the little settlements up and down Rainbow river, John was at ease with girls and women—in fact, a general favorite. He was neither girl-shy nor gun-shy.

"Some fool city man has taken a notion to winter it up here," he thought as he saw the last of her over a rise out beyond where the creek was in a deep cut and the banks high. "I'm sorry though, as I wanted to run my lines up this little valley and see what it is like today. Darn girls, anyway—in the woods."

She had gone out of sight, in the depression behind the little ridge. The flickering stroke of her allusion to Johnny Sneakum was tingling yet on Aylesworth's pride. He half turned to retrace his steps back toward his dug-out, when he heard, first the snap of her little rifle, then her voice, raised in a scream. Placing his hand on the butt of his gun, he wheeled in his tracks and started up the trail she had made.

As Aylesworth raced for the summit of the rise he heard a man's rough voice, cursing. Then again the woman's tones were heard, fainter now,

appealing. Topping the slope, Aylesworth for a moment had a glimpse of the woman and a man, locked in struggle under a group of low hemlocks. She was defending herself desperately. The man was dark, somewhat over medium height.

As he neared them the crisis came. The girl collapsed and as she did so Aylesworth yelled hoarsely. His coming had been soundless in the snow until then.

At the cry of the trapper the man, casting one glance over his shoulder, dropped the girl and, before Aylesworth could throw the gun muzzle in line with the assailant, sped away, in line with the thick trunks of the hemlocks under which the struggle had taken place. Twice Aylesworth shot, feeling each time that he had missed. Then, just as he was at the point of striding over the girl, she groaned. He paused, stooped, saw that she had a cut on her forehead from which the blood was oozing out from under her cap visor. He dropped on his knees beside her, drew her body up until the upper part of it rested against his crooked knee. Then, pushing back the cap from her forehead, he saw the bruise from which the blood was trickling. Saw, too, the long brown lashes over the closed eyes, the rounded lines of the cheeks that were pale now under stress of shock and pain. The red fox, limp on the snow beside her, her rifle, slung to one side, the small ax, on which her left hand still held a grip, all caught his eye. The position of each was eloquent of her struggle.

He sought to make out if the man still fled and saw him, far up the slope of the hill, floundering through the deeper drifts up there.

"I can follow his trail later in this snow," he reflected. "I must take care of the girl now."

She groaned a little, turned un-easily on his knee. He reached out and got a handful of fresh snow and pressed it to her injured forehead. She winced as the pain smote through her returning consciousness, twisted to one side, and would have fallen from his knee rest, if he had not caught her and held her.

She opened her eyes, took two or three deep breaths and then glanced up and saw him.

"You, again?" she said, sitting upright.

"It seems so," Aylesworth said. "I heard you call out and came. When I get you back to your father's house, I'll take the trail after that fellow that attacked you and when I come to him, I'm coming a-shooting."

She got up unsteadily, and leaned against a tree.

He picked up the rifle and the red fox.

"If you can walk," he began, "I'll go with you and carry your things; if not, I'll knock together a carry-all out of limber poles and load you and your duffle on and —"

She grasped the rifle, then the red fox.

"Thank you just as much," she said, with an air of finality that was disconcerting. "But I'll take these myself. And I forbid you to harm that man. Thank you and—good day, sir."

She was trudging away, weakly, but determinedly, before Aylesworth had recovered his presence of mind. This time he watched her go with rising resentment showing in his glance and the grimaces he made at her back as she went. After she had disappeared between the trees far, far ahead, the trapper turned and paced back toward the lower end of the glade.

"Snoozer," he said, to the dog, when he had arrived at the dug-out and made ready to send it back with what speed he could get out of it, "aint it awful? When I offer to help her she calls me a pelt thief and when I save her from a ruffian and offer to punish him, she forbids me to touch him and won't even let me carry her rifle and fox skin home for her."

"Bow, wow, wow," said Snoozer, not only that once, but several times, on the way back to their own shack and inside it that evening before sleep time.

But then, Snoozer said "bow, wow, wow," to almost every direct re-

mark his master addressed to him, so perhaps that bit of dog Latin is immaterial.

CHAPTER IV.

After Snoozer had stowed away that last grease-smeared flapjack next morning, Aylesworth sat, pipe going, humming to himself the old tune:—

"There was a man and he had a cow
And he had no hay to give her;
So he got him a fiddle and played
her a tune:

Consider, old cow consider."

"Yes, you old Snoozer, consider, old dog, consider." he parodied to himself. "She wouldn't let me help her, nor yet bust wide open that man that hit her."

Then, after another puff or two:—
"And she's a spunky little devil,
too. Stood me off with her gun and
only gave in to that other fellow
after she had made a good fight.
Well, she's so tough, she can run her
own show, old Snoozer."

Yet when he went outside, he did not have any traps, as he had intended. Nor did he turn off to the east to run out a trap line toward Neta-gomish, as he had planned. Instead, with meat gun and small axe belted on, he went off up the little trickle toward the marsh. The weather had warmed during the night. The light snow was going fast. The sun had taken up the mists and now flooded everything with golden light. Crows cawed lazily and the ground squirrels were even scurrying. It was more like a day in early spring than one in the autumn.

Snoozer enjoyed himself immensely, and was first to find a mink and a half dozen muskrats on the trip up to the marsh and through it. The dog's master had something else besides peltry on his mind. As he drove the dug-out along, his brows were knitted in thought.

But once at the upper end of the marsh he hesitated. The memory of the girl's repulse of his offers returned.

He pulled the dug-out up until it was safe, and then struck off up toward the little creek's bed. But he turned aside long before he came

to where he had encountered the trapper girl the day before and swung off to the west, on the slopes of Nescopern, where he began to scan the softening snow ahead. Snoozer, in obedience to the command "to heel," trotted along calmly enough. If the foolish man wanted to keep him in, that was his business, although Snoozer could smell things that the man could not see. So Snoozer was not surprised when his master hastened onward, after sighting the tracks of a man on the steep slope, long after Snoozer had seen them and had winded them with his keen nose that told him that the tracks were those of a stranger to him.

"He went up this way, old Snoozer," Aylesworth said to the friend who knew it already. Old Snoozer only cocked a non-committal eye at the tracks. They did not concern him, if the two-legged god he served was going to take the matter in his own hands.

Topping the rise that marked the division between the highland and the little glade, Aylesworth turned to the east and saw below him the spot where he had seen the encounter between the man and girl the day before. The floundering tracks of the fleeing man were plain enough. Once he had fallen just before coming to the top of the sharp slope. Aylesworth was inclined to put that down to a slip of the foot until he saw on the snow at the side of the imprint of the fallen form in the snow a spot of rusty red that told him that the man had been bleeding when he had gone down there.

"One of my bullets must have hit him," the trapper thought.

From there on there was no more sign of floundering in the man's trail. But the wounded man had gone slowly, often stopping to lean against trees. Once Aylesworth found where he had removed one of his shoes, the imprint of the bare foot showing where he had stood for a moment with it uncovered and there he saw another stain of rusty red, such as blood on the snow makes when it has

been exposed to the weather for some hours.

On the high land the snow was not melting as fast as it had been in the valley. Here the man's tracks were plain, distinct.

Striding easily forward, Aylesworth made good time. About noon, when he was about opposite the head of the glade to his right he found that the trail dipped into a depression among the pines that crowned the slope there and at the bottom of the dip he saw a brush shelter, such as a man will put up for a stay of a day or two in open weather.

Aylesworth turned cautious now. He might have saved himself time by noting that Old Snoozer was not careful in his approach to the place. Seeing no one about, the trapper inspected the exterior of the lean-to, then went forward. The tracks about and leading to and from the shelter were too confused to give him the clue he was after until after he made painstaking inspection.

As he was about to step forward and risk exposing himself, Aylesworth happened to notice that Snoozer was yawning, uninterested.

"Nothing there, then," he reflected. So he stood up and with free stride, went to the open side of the wickiup. Bending, he wormed his way inside. Old Snoozer had told the truth by his indifference. The shelter was deserted.

Coming out, Aylesworth went about the spot with care. He finally unwound the maze of tracks and found where the man had gone off from the shelter, along the farther ridge, in the direction of Stratho. But Stratho was fifteen miles away and the way to it across the highlands was not an easy one. Aylesworth always preferred the Rainbow River route when coming to the Nescopern.

That point settled, the trapper went back to the lean-to and inspected its interior narrowly. That inspection yielded him nothing. Not a scrap of paper or a utensil had been left.

A comfortable bed of pine needles was on the ground under the lean-to. The sun shone against the poles,

warming them and the air inside thoroughly. A few crows scolded overhead and a squirrel chattered. Aylesworth drew out his lunch—two bacon sandwiches—and munched it thoughtfully, then threw Snoozer a piece of rabbit he had brought for him. Then the trapper drew out his pipe, crumbled some tobacco for it, and began to smoke reflectively.

The whereabouts of the man was none of his business. The woman had forbidden him to follow up the assailant on her account. He had wounded the fellow and if the man made a complaint at Stratho he might have to face a justice and explain, losing weeks out of the trapping season perhaps. Clearly he had done right at the time to shoot, but if he got before a backwoods Dogberry on a charge of using deadly weapons and the woman insisted that she had told him not to harm the man on her account, where would he be?

"I guess old Snoozer," he said, "we'll about go back to our own part of the woods and stay there."

He did not notice that Snoozer then was listening intently or sniffing the air as he sat just inside the wickiup. Or if he did, laid it to the dog's possible interest in the crows or the chattering squirrel.

After a few moments Aylesworth got up and started out, not very wide awake to the things of the moment; his mind on the puzzle.

Just outside he heard the order:—"No farther!"

From behind a pine stump nearby a capable little rifle barrel projected, in line with him. The voice was the voice of the girl he had saved the day before.

Snoozer barked, as much as to say,—"If you'd minded me, instead of dreaming, you would not have been caught so."

The girl stepped out from behind the stump. Her rifle came down.

"Oh," she said. "I didn't know it was you—"

She paused, embarrassed. Behind her stretched her trail, showing where she had come from the northeast up the slope, quartering up it, as Aylesworth had from the south east.

"The trapper inspected the exterior of the lean-to."

Her face was pale and a bit drawn. Aylesworth still could see the marks of the bruise on her forehead where the man had struck her, but she seemed to have recovered fully from her disagreeable experience.

"I thought I'd run this fellow's trail out to see if he kept on out or if he needed any more attention," said the trapper.

"I told you yesterday not to follow

him up," she replied, with a rather wistful note of appeal in her voice. Snoozer by that time had edged close to the woman. Now he made a tentative approach to her, tail wagging, an amiable expression on his honest face.

CHAPTER V.

"Good dog," she said, bending

over and patting his rough-haired sides and head. "Good dog."

Again, as on the day before, Aylesworth noted that her voice had in it a hint of something pleasant, if she felt disposed to make it so. Again he caught the foreign accent, perhaps French.

"Come here, Snoozer," he ordered sharply. The dog glanced at the girl, then at his master, then yielded to the greater compulsion and left her. "I want my dog to be mine, not everyone's fool."

Aylesworth turned shortly on his heel, snapped his finger to the dog and started away, angry with the woman, angry with himself.

"Wait!"

She had called to him.

He paused, thankful inwardly for the opportunity to secure surcease from self-reproaches that already were irking him sorely. Before he had gone two steps back, Snoozer was beside the woman and she was patting the dog again.

Her cheeks were not pale now; they were flushed, her eyes bright. The little rifle she had dropped against a tree bole.

"I am sorry I was so short with you yesterday," she began. "And that I pointed my gun at you a minute ago. I saw that man stumble when he was running away from you and was afraid he had been injured, so I thought I'd come up here to see if he was all—"

"Then you knew he had a shelter here?"

His tone was sharp, inquisitorial.

"I half suspected it. Why do you ask?"

Her tone was assured, calm.

"I thought when a man knocked a woman down, as he did you, that a woman would not care where he stayed or what became of him—"

Her gaze met his with level warning.

"You forget that that is *my* business," she said with an accent of finality.

"True," he said, ashamed to have pried into something she preferred to keep to herself.

"And just to show you that it is my business, why I may add that that man is *my*—"

She hesitated. Aylesworth, intent upon her words, almost feared to hear the next word.

"Your?" he suggested.

"Husband," he faintly heard her finish.

"Ah!"

His breath was exhaled in a little puff that escaped him, despite his instinct toward repression. The sun did not seem quite so bright, the clouds scudding over so white, the air so warm. The little breeze seemed to chill him as it tugged at the pine limbs, low and high.

"I understand now why you told me to let him alone," he said.

She was silent; appraisingly silent.

"Of course if you wanted to come up here to see if he needed anything, why that's your business, not mine. I guess I'll be going now. If there's anything you need any time, I'm below the marsh, on Otter Creek, about two miles up from Rainbow River."

He turned to go and this time she did not stop him. Glancing once back over his shoulder, he saw her standing there, her back against the tree, her little rifle near, the brown-red tones of her mink cap showing warmly about her face, her skirts swaying in the passing breeze—a sprite of the northern winter.

As he had glanced backward, he had not eased up in his free swinging stride. Better for him if he had, for as he turned his face frontward again, it was too late. He had placed his foot into a hole, covered with leaves. Into the hole his foot sank and he was thrown, lurching forward, spinning, to come down at last heavily on his right hip. He essayed to arise, half made it, felt his head reeling around, feared to sense the sickening pain in his hip joint that might presage a serious injury, then

"Could you hitch yourself up and back a little onto a traversel?"

It was the voice of the girl again. Aylesworth, on his back, felt snow pressed to his temples. A cool,

firm hand was under the back of his head.

"What has happened?" he asked, wonderingly.

"When you fell you struck your head and I'm afraid you have hurt your right leg badly," she said; "you twisted that, too."

Aylesworth remembered then his lurching fall—and his fears for his hip. He twisted his body and had to yield to the force of pain's arguments against any further effort just then. Decidedly his hip was in bad shape. Snoozer regarded him sadly.

"I knew you'd come-to," she went on, "and while you were unconscious I lopped down poles for a traverse. If you can work your way onto it, with my help, I can get it off down the slope and back to my camp—"

"It isn't far to my dug-out and once in that it is water almost all the way to my camp," he suggested. The hip was throbbing now, very much.

Aylesworth felt very foolish. It was the first time in his life he had been helpless and now it must needs be when a woman was his care taker!

"Or you might fix me a wickiup down below and let me stay in it until I get better or you can get word out—"

"No, I can take care of you if I can get you in somewhere that I can do it," she insisted.

"How far is it to your camp?"

"About three miles."

"It's about that to my dug-out."

"But once to it, I'd have to get you in it, and out at the other end of the marsh, then out of the dug-out make a new traverse and get you to your camp."

She puckered her brows in keen consideration of the problem. Aylesworth again saw the fading mark of the bruise the man had inflicted upon her.

She placed her hand on her little ax and turned, decision in her every move. Back of him he could hear her trimming the ends of poles that she had lopped down. Too deft for a city girl!

"I'm going to take you to my camp," she announced briefly. He

felt that the decision had been taken out of his hands—and was glad.

From her pockets she produced plenty of cord. Down the slope she found a larch tree and from its roots fashioned tough binders. She worked capably, easily, surely. Despite his pain he watched her with keen interest.

"You don't make it quite like we do around here," he ventured. "Nor do we call it a traverse. We make it narrower, longer, and call it a carry-all."

She made no comment, but kept at work.

"There," she said as she finished and placed it in position back of him. "Raise yourself and hitch back and I'll see if I can slide it under your body. 'Traverse' is the word we use."

Five minutes later Aylesworth, holding her rifle, was sliding on the rude but strong contrivance diagonally down the slope. There was no strain on her, except to guide the traverse and to hold it back.

On the level the pull came hardest. The snow was smooth along the little creek side and the leaves lay snugly on the forest mold underneath, making it easy for the poles to glide. Often he expostulated with her, but she persevered. The pain from Aylesworth's hip was racking him. At times his head spun dizzily and often it seemed to him that he forgot. At the end of one long spell of haziness he found the traverse still, the twilight coming on space, old Snoozer licking his face. Three big pines were near.

"Here we are; right at home," came the woman's cheery voice. "If you can manage to stand up on that one good leg and hop along, resting your right hand on my shoulder, I'll have you inside soon enough. I call this Three-Pine Inn."

With much discomfort, pain, and a failure or two, Aylesworth made it. Despite the pain he found it pleasant to be dependent upon her. She found a place for him on a seat inside made from half a barrel up-ended, with part of the staves cut away, the

inside stuffed with earth, the seat covered with an old coat.

"First, some supper, then we'll see what's to be done," she announced.

Despite the hard work she had done she turned briskly to the sheet iron stove to prepare the evening meal. Aylesworth watched her with the feeling that his hip was less and less painful, now that he was at ease, not jarring over uneven ground with it.

She shook from the tea box enough tea for them with a single flirt of the box. She had ready, as if against that need, just four slices of bacon and a small can of beans. Soon all was ready, served, on the table made of slabs. At her invitation, Aylesworth began to eat.

The cabin, Aylesworth saw at a glance, was one of those used by deer hunters earlier in the fall and by fishermen on their way back from Rainbow to some of the smaller streams flowing down Netagomish. It had been put up by the guides as a convenience to the public.

The girl noted his attempts to appraise the situation, but said nothing to enlighten him. She seemed to have something on her own mind.

At the meal's end Snoozer, expectant, had a piece of bacon, a piece of a biscuit that she found for him. The dog curled up near the sheet iron stove and went to sleep.

"He's sensible," was Aylesworth's comment. "As for me, I'm going to sleep in this chair, as much as I can. Don't let me make your life miserable. I'll be able to travel tomorrow, perhaps."

"Are you sure?"

"Yes, I am beginning to believe that when I fell I came down on the big nerves in my hip joint and that the harm was worse in seeming than in reality."

"You are not saying that just to reassure me?"

"No, Mrs.—"

He paused awkwardly.

"Mrs.—"

He paused again, inquiringly.

She flashed a smile at him.

"Mrs. DuPointe," she finished for him. "And your name?"

"John Aylesworth."

"Now that I am on the subject of you," she continued, "are you sure no bones are broken in your leg?"

"No, see." He made his toes wiggle, causing his shoes to flop up and down as he held the injured limb stiffly out before him. He stood up, hopped tentatively—sat down with face drawn with pain, but with triumph disputing with the agony on his features.

"A bad, bad bruise," he said. "If I'd known back there what it was, I'd taken a chance in a lean-to for a day or so and gone back to my place in Silver Dale a hop at a time. The dug-out would have made it easy."

"Well, we did the best we could—at the time," she offered.

"And I thank you for it," he said warmly. "You certainly don't wait to pay your debts."

She seemed about to give him a chilling reply for his allusion to the events of the day before, but evidently thought better of it, for she remained silent, her head on one of her hands, as she leaned an elbow on the table. Aylesworth glanced about. The bunk, at the far end of the cabin seemed comfortable, with its blankets folded neatly back, and he could help but think of his own tumbled bunk, that often did not get placed in order from month's end to month's end. She noted where his glances were directed.

Aylesworth met the situation with the characteristic directness of the men of the open spaces:

"Here," sliding off his belt and laying it on the table. "I'm not good for much. Take my gun and axe and keep them until I am. If anyone comes in the night, you'll be able to care for yourself better than I'd be able to do it for you, perhaps. I can bunk down on the floor or sleep in this chair. Perhaps your father may return—"

She stopped him with a gesture. He could see that turning the axe and gun over to her had won her confidence. Disarming himself, he

had disarmed any latent suspicions of him that she might have held. He had won her confidence.

"I may as well tell you," she said, "that when I told you that trap was set for the fox by my father, I was not telling the truth."

His eyes opened wide. He gave her a glance of frank amazement, but she went on, sweeping aside his initial questions with:

"I've been living here alone—since four days ago. My father taught me how to trap. If you care to listen, I'll tell you how I came to be here—"

"Go on," he encouraged.

He made a shift to ease his twisted limb; drew out pipe and tobacco from his shirt front, questioning her with his eyes.

"Go on, smoke," she said. "I know you men of the trap line are accustomed to tobacco and you must need it now, in your pain."

He crumbled the plug eagerly. Soon the peace clouds floated to the ridgepole. It was dark outside now.

The wind whispered under the rude eaves. Off on the slopes a great owl gave forth his blood-curling calls. A fox on the rocks afar said:—"Yap, yap, Yar-r-r." The woman got up, hunted a candle, placed it in a bottle neck. Aylesworth touched a match to the wick. The woman settled herself on a stool at the table's end.

"Now," she said. "Let me begin at the beginning: I was born in the Saguenay country, Canada—"

"That's where you learned to trap?"

She nodded, settling herself for the recital. The candle flickered, its yellow rays lighting up her smooth, rounded cheeks, her chestnut hair that made such an effective frame for her pretty, frank countenance. Her two plump palms came up to support her chin and her elbows sought the table-end. The red waist that had been revealed when she had cast off her fur coat added, by its reflected color-tones, to her own natural refined color.

And so she began her tale.

(The next installment of "The Bear of Silver Dale" will appear in July issue.)

A Woodland Adonis

ED. CAHN

WAL, we got the dinner'n the gaff, an' the minnies an' the rods, an' the pitcher taker—what fur are we a settin' here?" Holly stepped into the canoe, dipped his paddle and we were off for the day's fishing.

He handed me the best 'lunge bait. "This here spinner's half copper an' half brass—they ginrelly like that—but I betcher you'll niver git a strike all the same."

He dropped his own bait into the water and watched the line sliding out of his pocket and over the side with a pessimistic frown. We started late, the wind was in the 'wrong quarter, the day bade fair to be too hot for fishing and consequently Holly was plunged in gloom. In his philosophy the day that the 'lunge would not bite could be counted as lost.

We headed toward Lovesick, Holly's paddle splashing mightily in the narrow isles between the wood beds to scare the coy maskinonge out where they would stumble upon our red-feathered hooks.

But all for nothing. The fish were not biting and my guide's spirits

continued to fall. The golden splendor of the sunshine moved him not. The silver of the birch wooded shore, the rosy granite isles with their tall pines and higgity piggity jumble of stone and fern, flower, berry and bramble flaunted before him to no end. A thin flock of early teal wheeling overhead awoke no gleam of interest and not even the spectacle of a giant bass jumping after flies out in deep water where he had no business to be, could make an impression upon Holly's apathy.

"What an improper time of day for a bass to be after flies," I ventured.

He jerked his line free of weeds. "I'm all the time a tellin' you them dashed bass aint got no brains. It's the 'lunge that's the thinkin' fish."

We went around the weed beds twice and then we dropped our anchor upon the granite shoal jutting out from what Holly called Spook Island, and settled down to bass fishing.

"I got a feelin' " said Holly as he bent over the minnow pail to pursue an agile shiner with his hand net, "that this here is one of the days

when the fish is on possible fur to be ketched."

"Why?" I asked, knowing what was expected of me as a properly behaved tourist.

"There's too much lollygaggin' a goin' on roundabouts. Fish is the awfulest animals fer bein' nosy-minded as ever was. Jist as quick as a feller and a gal git to spooning on the shore, all the fish knock off work an' come a runnin' fur to listen and fur to see.

"Purty soon they git to laughin' so hard that they fall over each other and wear theirselves plum out, complete. Then they go to the bottom and they stay there all day, restin' an' gossipin' while here we be toilin' away up here fishin' fur 'em fur nawthin'."

I observed that there was nobody in sight this morning.

He smiled at my city dulled eyes in superior fashion said, "Korreck ye are; five'n four's eight!" and pointed across the bay to the middle island.

I could just distinguish a canoe, and a girl in a white middy, and a something which I took to be a man. I pointed out to Holly that he was going quite a distance to borrow trouble, that the pair might not be of the fatal lover sort, that perhaps they were brother and sister or grandfather and grandmother.

He smiled as he hunted in the mysterious recesses of his voluminous black overalls for his tobacco. "Them's the fatalest kind. That gal is Nellie Evans. She's the teacher of the sixteenth school. And the feller is Donis Wells—him that's the goodlookinest cuss this side of Peterboro; or t'other side if it comes to that.

"W'y he's so goodlookin' that a painter woman that was here two summers ago called him Adonis. She met up with him on the Young's Point road and she said he was like a Grik statoo come back to life; whatever she meant by sich talk; and she hauls out a pencil and starts to draw a picter of him right there and then. But he went a tearin' down the road away from her like there was a bar

behint him an' sinct then everybody calls him Donis.

"Him an' Nellie's sweet on each other—Dad burn 'em! I wisht they'd git spliced an' quit charmin' off the fish."

"Why don't they?" I asked, trying another rod to change my luck.

"Donis's that anxious to he's fair champin' the bit, but Nellie she's hanging back. She's feared he'll git over wantin' her quick's he's got her and the thought's like pizen ivy to her. Nellie's proud and she's smart even if she ain't purty.

"She's saw a lot of married parties sinct she's been teachin' aroun' what wish they was loose agin an' she's shy o' gittin' herself hitched up into a box stall where she couldn't git out if she's a mindt to, that's one reason and another is that she's afeared that Donis will allus have a swarm o' gals eyein' and smilin' at him from fence corners, 'cause he's had 'bout seventeen million gals a-ready an' he's as handsome as 'riginal sin. She's skeered that if she marries him 'long 'bout the time the weddin' cake has been all et up he'll be tired of plain little Nellie an' begin to jerk on the mat'monial halter. She can't abear the idee of him gittin' tired o' her and wantin' to git away and she tied up to him like a anchor, so she keeps a shyin' off.

"If I was her I'd grab him. He's a nice lad even if he is too good lookin' fer this world and she'd be one too many fer any kingfishin' wimmin, that might come snoopin' aroun' I'll lay my best eye on it. He's got a good saw job down to Samson's mill an' gits good wages. He don't get plastered, nuther, an' his folks make a purty decent menagerie in the fambly album. Nellie couldn't do no better if she—"

"Looky there! Ya got a strike! Oh, Boys! but he's a big un! That's it! Yank 'im right off'n his feet!"

The bass had begun to bite and Nellie was forgotten until noon when we built our fire not fifty feet away from where they were.

I being a romantic old maid, intruded upon them without delay

and insisted that they lunch with us. Donis was not overly pleased but helped Holly skin our bass and collected a pile of wood for the fire. Nellie seemed relieved at the interruption. I could see that she wanted time to gather the forces which some vigorous attack of Donis' had pretty well routed, and so I ordered that the potatoes should be baked—baking takes time.

It was true, she was not pretty, her features were irregular and her eyes though bright and black, were too small for the demands of beauty. She was as slender as a reed and as wiry but she had patrician hands and feet and a truly royal carriage. I think I should have called her entirely cold if her rich contralto voice had not held all the warmth her face denied.

And he was an Adonis if ever whimsical nature fashioned one to be wasted in the green gloom of an unappreciative backwoods country. He was tall, wide-shouldered and narrow waisted with fine straight limbs which not even the crude country garments could conceal. His deepset sea blue eyes curved behind their long lashes in the perfect arcs one sees in old marbles, his nose might have been chiseled by some ancient Athenian master and mouth and chin and forehead matched it fully.

He spoke as any mill man would but his voice was good and when he looked at Nellie, which was nearly all the time, there came a note in it which thrilled even my withered heart and made Holly's eyes gleam.

He had a restless trick of stirring up his yellow curls until they stood on end and when he did it I could have loved him myself. But it seemed lost on Nellie. She scarcely glanced at him, when, after our meal of fish and potatoes and tea we sat on the ground and talked lazily. She quizzed me about the world beyond Peterboro and the news of the women's movement and said how she would love to get into the fight for the franchise herself.

Holly interrupted her with, "What d'ye care about that, Nell? Leave the world to worry along the best

way it can without you and git married like a sensible gal."

"Amen!" said Donis fervently.

Nellie's thin lips curved in a slight, cool smile. She fixed her eyes on the rise and fall of two pirate crows above us for a moment and then dropped them to Adonis' face.

"I have decided never to marry. I am going to see the world and do my work in it; be free; and leave others free."

Adonis recoiled as if she had stabbed him, then the hot color boiled up in his face. He seized her shoulder and shook her so violently that her teeth clicked together. "Is that my answer, you cold hearted one?"

She eyed him dauntlessly before she replied. "You know it is, and I shall not change it."

"Oh you won't? Well wait till you're asked!" He thrust her away from him and jumped into the water without so much as removing his coat.

I thought that he meant to commit suicide right there before our eyes but Nellie calmly reassured me.

"He's going to swim over to the mainland and go home through the bush. Sure, it's no swim at all for him but it's hard on his best clothes."

She got into his canoe and took up the paddle with steady hands.

"Excuse me, and thanks for the dinner. You will be wanting to get back to your fishing and I'll not hinder you."

She glided off toward the middle of the lake and turned north without so much as glancing at Adonis whose head was steadily bobbing away eastward.

Holly spat at a chipmunk seeking crumbs. "An' yit some folks'll tell you wimmin aint queer inseccks!"

We saw Adonis clamber up the far shore and plunge into the woods, but if Nellie turned back to look before the islands hid her from us, neither of us saw her.

My vacation ended with that day's sun and I did not see either of the lovers again.

The next summer when fishing time came again I bought a Canadian

ticket and returned to that lovely region of bright waters and happy lands, the Kawarthas.

Holly was waiting for me with a bucketful of fresh minnows, a can of dew worms and an elastic smile. The bass were biting and they allowed me to catch my legal limit of their number in my first two hours but finally, I had time for gossip.

How were Donis and Nellie?

"Waal mum, if folks go fur to tell you that nobody can live without a heart, don't you listen to 'em. Nellie gits along fine with nothin, but a stone. Y'mind how she fired Donis that day like a old boot? Waal, the next day he was 'round after her fur to 'pologize fur shakin' her. The durn little Injun she smiled like an angel an' he felt better an' he up an' asked her to have him agin and she turned him down harder'n ever and laughed at him besides.

"I heered her myself a tellin' him that he was fur too purty a man fur a plain gal like her and there wunt no use him hangin' aroun' her. An' to show him she wasn't foolin' she up and hikes 'er to Chemong with Nate Buller—him as Donis despises above ground! An' she kep' a going with him.

"Donis, he felt so bad that he lost most o' the meat off'n his bones an' he went aroun' lookin' like he's been bid to his own funeral. I told him that weren't no way fur him to do. I told him he oughter sicken her o' that and that the thing fur him to do was to make her greeney-eyed. He sawd I was right and so he started in to beau Lizzie Arnold aroun'.

"I got to say fur Donis, when he's a doin' a thing, he does it right. It wasn't no time till he'n Lizzie was 'gaged and the weddin' day sot fur a fortnit. An' you can belee me or belee me not, that stony-buzzomed Nellie was the first to wish em luck an' she giv Lizzie a swell kitchen shower with everybody fur miles aroun' invited and two dishes of ice-cream and all the cake a body'd eat."

"But what beats me is why she shook Nate Buller. I should think she'd a hung onto him like a puppy to a root after she'd lost Donis. But

she didn't, she up an shooked him the minute she heard Donis was 'gaged."

"Waal, the day after the kitchen shower, Donis went to the mill in the morning as per his usual. He's a sawyer an' was workin' the big circular. He'd just started her up an' he seen a blob o' sawdust on it and he reached down to the floor to git a bit o' waste to wipe it off.

"He clean forgot that he an' Lizzie had been a scufflin' and she tore a piece loose in the shoulder o' his coat. The teeth o' the saw ketched into that piece loose and pulled him over onto it like lightning.

"Nate, he was at the other end of the mill, but he had saw it and he made a dash to shut off the power but he couldn't get there quick enough and Donis couldn't help hisself and the edge of that there divvil saw had him!

"It got just one side swipe at him and threw him against the wall but it sliced—Aw! it's too hidgeous fur to be tellin'! But one good thing was it missed his eyes. It's a wonder it didn't kill him complete. He bled all over the place and everybody thought he'd die before he could be got home but he's alive this minute."

"And did Lizzie marry him?"

"Nawp. They say her folks made her bust the gagement. She felt turr'ble sorry fur Donis, but he could niver expect her to marry a man without a face, and everybody said so.

"After thet, Nellie took to goin' an' settin' with him after school under that soft maple in front of his house but she soon quit it fur he told her he wanted none o' her pity and he wouldn't take up her time, nuther.

"He went to all the doctors fur miles aroun' but nobody knew how to do nawthin' fur him an' he got turr'ble downhearted and out o' money. He got snappity with folks, too, and so he was let pretty much alone.

"He took to stealin' off in the bush, trampin' all day and hidin' behind trees if he seen anybody comin'. He'd borrey my old canoe, his'n being sold to pay a doctor's bill, and paddle all day and half the night,

keepin' away from everybody for fear he'd be stared at. An' he got sour and melangolly, the pore feller.

"I was a drivin' along the Buckhorn road one day an' I met up with Nellie an' giv her a lift. We hadn't gone more'n a mile when we saw Donis layin' beside the road, 'snorin'. Nellie she looked at him without flickin' a eye and she sayd to me, 'Drive on Holly, there's nothin' we can do.'"

"Boys! but that made me mad an' I lit into her, wicked! I tol' her that she was a pore kind of a woman anyways an' that if she'd a took him in the first place as she'd order did, him an' Lizzie wouldn't a knowed one another well enough to skuffle an' his coat wouldn't a been tore and got ketched an' nawthin would have happened an' he wouldn't be druv to drink out o' pure pizen miserable-ness.

"She never said a word but I could tell that what I was a sayin' was a sinkin' in deep an' I let her have it hearty an' strong. Finally, 'bout ten minutes after I'd quit, she asks me what I thought she could do now and didn't I know that the doctors said there wa'nt no cure for a lost face?

"Oh, I says, you can't do nawthin, but anybody what thought anything of him could and if they couldn't they'd do it anyway!

"She jist opened her eyes and her mouth as if she was a goin' to light into me and give me a good settin' out, but she niver said a word and when we got to Buckhorn she flew into the store and banged the door after her and that's all the thanks I got fur givin' her a ride.

"She's turr'ble secretive, is Nellie. She tuk the boat next day an' went clear to Peterboro and niver said a word to me 'bout goin'. The folks at the Point mistrusted that she might have a beau there, seein' as how she had throwed down both Donis and Nate, and everybody was talkin' about it until Donis went and gave them something new.

"Some of them boss doctors down there to New York had heard tell of his case and they was a itchin' fur

to try their saws on him. They said if he'd come they'd fix him up fancy and they sent him a ticket to come and fifteen dollars for expenses, extra.

"Pretty near the hull Point was there to see him off, 'cept Nellie. She took her canoe and went off somewhere with her chilly self an' let the pore boy go without even a handkersher wave from her—but that's Nell Evans over agin.

"Waal, Donis was gone three months and when he come back he had a new face, you kin belee me or not! Them doctors had got mighty busy and a lot of folks had read a piece in the paper about him and they'd giv him some of their skin an' he had a whole face agin. O' course he looks sort o' queer, an' you kin tell something has gone wrong sometime, but he's got a face anyhow."

"And will Lizzie marry him now?"

"Nawp. She couldn't without bustin' the law, for she an' Nate Buller skipped out and got married while Donis was to New York.

"And how about Nellie?"

"Aw, her!" Holly's voice was full of disapproval of Nellie and all her works, "she was in the crowd when his boat came in an' I heered her sing out, 'Hello, Donis, awful glad you're back agin all right.' He was so s'prised he couldn't answer her and she jist turned red and hikes 'er fer home and from that day to this she's kep out o' his way. He ain't seen her close onct.

"An' he might's well stayed away from New York fur all the good it done him. He's got the notion she can't bear the look of him an' he's tuk to the timber agin. He keeps hid like a thievin' Injun and even in the bush he wears a mask!

"He's crazy to do it. He don't look half as bad as lots that niver had no circular saw a chawin' up their faces. He's as thin as a worm-eaten rail and I'll bet my best cedar paddle 'ginst a dead minnie that he'll be foun' in the lake afore the leaves turn red. He's plum miserable, 'cause he loves that durned Nellie more than ever. Waal, let's us troll a while, it's 'bout time fur them muskies to be a gittin' on the job."

Holly sighed and relapsed into silence as he handed me my troll and burnished the brass spinner of his own bait with his thumb.

We were close to shore and glided soundlessly through the placed water for half an hour and then suddenly I saw the masked man.

He was sitting on a stone a few feet back from the water and he would have been entirely concealed by bushes and brambles if a stray colt had not been reaching for the delicate leaves of a young tree and bending a branch so that a view was opened to my roving eye. He did not see me, for his face was buried in his hands and his thin, bent shoulders were shaking with the deep silent sobs which well out of the heart when it can endure no more.

Holly had not seen and his tireless paddle bore us away. We trolled for an hour and then, returning as we had come, anchored in the shadow of a little bend to still fish. The colt had stripped the young tree, and the stone where Donis had been sitting was empty.

Holly baited my hook and then pulling his hat over his eyes stretched himself in the bottom of the canoe for a nap.

The last storm had uprooted a giant pine and it had toppled half into the lake. Our canoe was shaded by its spiky branches which concealed it from the shore. There was no sound nor sign of life outside our little craft: not a breeze stirred the birches and elms and hemlocks which rimmed the still waters. At their feet the water iris flaunted and dragon flies darted in and out. In the sky a superb cloud pageant was being staged for my sole benefit and I was watching it when the slightest of sounds made me turn my head.

Beyond my pine screen a red canoe was gliding in to shore. It stopped went on, stopped again, as if the girl with the paddle could not make up her mind, and then finally, it beached itself.

I glanced apprehensively at Holly but the slight crunching sound it made against a log did not disturb his slumbers. Somehow, I felt that

Nellie Evans was in no mood for Holly's greetings. She stepped out of the canoe and seated herself on a stump which grew near the water, and I was shocked at the misery in her face.

While I was wondering whether I ought to make my presence known to her the thicket behind her parted and Donis blundered upon her. She turned around before he had time to retreat and so he stood dumbly before her and crooked his arm over his mask like a boy afraid of a cuffing.

"Gee, Nellie, I—I never knew you you was here or I'd not have come. I wouldn't be saw, for anything. I guess you know that."

She smiled indulgently and patted the place beside her. "Come and talk to me, Donis."

He took an eager step forward and then, turning his back upon her began to paw blindly at the thicket to force an opening.

The girl sat still an instant and then she sprang up and dragged him back. She snatched off his mask and threw it with passionate vehemence upon the ground and stamped on it.

"There! That's the last of that! And don't you ever dare to put another on!"

He stood before her, the color flooding into his poor face and dying away again, "But I ain't fit to be without it," he whispered hoarsely "how can you bear to look at me?"

She hung her head. "How can you bear to look at me!"

He groped for the meaning of that blush, that idiotic, halting little query leaned over to read her face, drew back a step in bewilderment, and the next instant Nellie had thrown her arms around his neck and kissed him. "Oh, Donis, aren't you ever going to ask me again?"

It was then that I discovered that I had lost my minnow and it took me a long time to re-bait my hook. It occurred to me during the process that I had no right to remain but I seized upon the excuse that to go now would mean to be discovered and that would mean embarrassment for the

lovers, and so I sat still and let Holly sleep.

It seemed as though Donis would never let her go now that she was his. Happiness was re-creating him, his shoulders straightened and the light from his marvelous blue eyes bathed them both in glory.

"Do you mind if I kiss you again, Donis?" Having asked permission she did not wait for it.

"Oh, the Lord is good to me, Nellie! I've got you and if I only knew who to thank for paying my way to New York and for getting the doctors to fix me up I'd be happy for time and eternity.

Nellie smiled, a rear, radiant smile that made her more than beautiful. "It was me, Donis, dear. I wrote the doctors and sent the letter from Peterboro so nobody'd know."

"And the ticket and the money for extras! How—?"

"I had some money in the bank and I used it for that. Haven't I been schoolmarm for five years?"

"Why—?" he marvelled, man fashion. She laughed and crept closer within the circle of his greedy arms. "Y'know, Donis, I always did love you, but when you were so handsome it seemed that you couldn't be for ugly little me. I couldn't believe that you really wanted me forever, but afterwards I knew you did; that yours was a deep down, never say die sort of love, same's mine for you. And then I tried to show you that I knew it but you wouldn't see and I was angry. And then one day—I was talking to Holly and he gave me the idea and I wrote to the doctor. For a man, Holly has very sensible ideas sometimes."

I glanced at Holly's end of the canoe and was startled to see him sitting up. He had his paddle in hand and was grinning widely. "Korreck y'are—five'n four's eight," he whispered. I nodded and we silently stole down the lake leaving them to their happiness.

Well Satisfied With Rod and Gun

The following humorous letter is one of the many of a like nature that are constantly being received from satisfied subscribers.

Rod and Gun In Canada.

Gents:—

Answerin yer pleedins fer more money, I'm tuckin my check rite in here to pay fer *Rod and Gun* tew nex spring. Eph yer hurry teh there bank-I kalkerlate ther feller in ther little winder will han yer out ther cool cash.

Gee-gosh-all-hemlock! ever sense Bill Kiser heisted the white flag, it peared to me that you hed jist settled yerself to see how goldarned good yeh cud make that book of yourn; an seat my hidel eph yer havent suckseeded fine.

Now from where I sit, I figer out thet such good stuff thet you do be ahandin out is fit fer better paper.

Sakes alive Ed! jest you order up some better stock, then heist ther price to fit.

Bless my sole Boss, there must be enough red-blooded fellers in Canada willin ter show they be regler he men an pay a fair price fer a sportin book sech as you be abildin.

Praps every feller don't jest kare to set up all night areadin erbout the gun thet will shoot around a corner, an them skunk-chasers mabee dont givderam erbout the burnin question. "Do muskies shed ther teeth in August?" And the season would be goldarned dry when yeh cud intres a fisherman in ther best worm-dope fer dorgs; but jest you pack the hull lot in a bag an lle change my terbacker eph yer don't heve teh holler fer help teh get thier book out on time.

Fish-a-get-ably,

Yers trolingly.

St. Catharines, Ont.

Billy Wood.

Diary of a Seven-Day Canoe Trip Through the Timagami Forest Reserve, August, 1918

CLARENCE A. BROWN

Personnel of Party:—J. A. Pelkie, Guide and Boss Canvasman; P. A. Huntington, Cook and Ration Officer; Thos. Fell, Cooke; M. J. McDivitt, Journalist; H. G. Shaw, Geo. Starling, C. Starling, C. A. Brown, Chief Occupation—Getting out of their share of the work.

Brown had been talking for months about the wonderful time Shaw, Pelkie, and he were going to have, providing they could get another fellow, or as many more as possible. The maps looked so alluring, as were his descriptions, that Huntington and McDivitt started to get interested. As the time for starting drew near they had practically decided to accompany the lads. This was finally capped by McDivitt announcing he could go.

Further plans were then made, for we had decided to start on Wednesday August 21st, 1918. Brown got busy and ordered our supplies which were to be ready for us when we arrived at Latchford, the starting place of the trip. Brown, who was in charge of the trip from this end, announced that Pelkie, who was

coming to Latchford from South Porcupine, was being accompanied by Tom Fell and two Starling boys, Gus and Tubby, (otherwise George and Cyril), making a dandy party of eight.

Our two canoes were shipped north on Tuesday a.m., as the boys from South Porcupine arrived that day. They were to have everything in readiness, when we stepped off the train, Wednesday morning.

Wednesday—

Huntington, McDivitt, Shaw and Brown, left North Bay at 6.05 a.m. on the National, which had orders to stop at Latchford to let us off. It was one grand morning starting out, but at Timagami it was raining. This, however, had cleared up when we reached Latchford at 9.45. Here, the boys from South Porcupine were all in readiness, with tent, grub, blankets, and everything packed. Took a last inspection of our supplies, and after adding a few things to it, proceeded with them to Bay Lake on the edge of Latchford.

Left Latchford at 11.00 a.m. and proceeded up Bay Lake. We had

made out more or less of a schedule for the trip, so our first stopping place was Pork Rapids at head of Bay Lake, nine miles from Latchford, which we made at 1.45 p.m. Here, while Huntington and Pelkie were preparing dinner, the rest went fishing for fresh meat for our dinner. Four in number were quickly caught, which were delightfully carved by Tubby and made a fine meal.

Dishes were then washed, and we made ready for our journey. Left Pork Rapids at 3.00 p.m., and after a delightful paddle up the Montreal River with its many turns and swamps arrived at Mattawapika Falls at 5.30 p.m. Montreal River was certainly the home of the wild ducks as we saw bunches of them all along the way.

Mattawapika Falls being our camping place for the night, we spent a lot of time enjoying their sights and fishing, catching three nice ones for our supper. Here we were visited by two fire rangers, who were quite glad to see us, and hear of the outside world. Around the Falls was our first portage of about half a mile. Just at the edge of the Falls we found a dandy place for out tent, Pelkie being instructor in the pitching of it. At 8.00 p.m., supper was served a la ground. The fire rangers having eaten, refused to join us, but were tickled to see the way we devoured our grub.

It was dark before we finished, but by the light of the full moon we managed to wash our dishes. Sat around, gazing at the water as it dashed over the falls and danced in the moonlight. It was a wonderful sight. Everything in its natural state. By 10.30 we were all blinking after our day's paddle, so turned in for a good night's rest. Not being used to the earth as a mattress we had quite a time dodging the rocks, as we rolled in our sleep.

Thursday—

About 2.00 a.m., Huntington grabbed McDivitt, saying "What's that? What's that? Don't move." He had seen a dark spot on the canvas and with the moon shining through two holes, he thought it was the

bears the rangers had been talking about. We finally convinced him it was only his imagination. He appeared quite happy, and was asleep again in a minute.

Arose at 6.30, just as the fog was lifting. Expected to have fish for breakfast, but Shaw and McDivitt reported only one between them, so we had to be content with bacon, and one fish among the eight of us. Pelkie and the Starling brothers packed the tent, and blankets, while Huntington got breakfast. As soon as the dishes were washed, we were ready to start.

Left Mattawapika Falls at 9.00 a.m., and proceeded up the river towards Lady Evelyn Lake. It was the prettiest picture we had yet seen all along the river which was just like glass. On either side were huge cliffs and rocks with pine trees of all sizes clinging to the crevices. You wonder how they held on. All along the shore, were water lilies galore, making everything harmonize.

About 11.00 o'clock, took a little rest in the form of fishing. Brown and McDivitt annexed two nice bass while Huntington got a pike and two pickerel. We caught all we could handle in about five minutes, so our rest was of short duration. At 12 o'clock, Chef announced we would have our dinner of fish on the next island. Pelkie had told us to keep our eyes peeled for moose along the river as they were quite plentiful. Much to our disappointment, we did not see any. To our surprise on landing on the island, we saw two Indians. Of course we went over to see them, and were delighted to see beside them a bull moose. They had just shot it a few minutes before we came along. It was a pretty beast just a year old; its horns still covered with fur.

While we were preparing our dinner, the Indians started to work cleaning it, and it was with hungry eyes, that we watched them carve off the quarters. They were experts at the job. Took several snaps of the operation then proceeded to pounce on the fish we had just caught. The way we devoured it,

you would think it were moose, but no such luck, though we were tempted to take some.

At 3.00 p.m., everything was cleaned up, even to the moose, so we started for Lady Evelyn Lake, about seventeen miles above the Falls. Arrived at the lake at 4 p.m. to find a heavy sea rolling. Our intentions were to have gone across the lake to Lady Evelyn Falls. Though we started out bravely, we soon found out it would be no easy job to face the head wind and swells, for we were taking water over the bows of our canoes every few minutes. Passed an island where a lady and a gentleman had taken refuge, and after passing a few friendly words with them, proceeded to find a camping spot. Flat rocks covered with moss made a dandy spot to pitch our tent. Huntington cooked our mountain bass, while we got our supplies unpacked and tent up. It sure did taste good, as we were real hungry. Our poor chef didn't get time to eat until we were nearly through as we devoured his cooking so fast. We decided to have jam but on looking in the can, and seeing how sick it looked after Brown had been at it, decided to go on rations in regard to it. No jam until Sunday.

We were all tired, as we hadn't slept much the night before, so as soon as Fell got through peeling the spuds for next dinner, we all turned in. The moss sure made a good mattress, and we were all soon in our places. Had made a gag for Brown so that he wouldn't awaken us in the middle of the night by his mumbling of things we knew nothing about. We were not sleepy so lay awake watching our big camp fire. Tubby couldn't rest until he had his bath so up he gets and gives a dandy illustration of swimming under difficulties. Weather very unsettled and still blowing.

Friday—

Arose at 6 a.m. Weather still unsettled. Had our usual run of bacon for breakfast. Started to rain a wee bit, so decided to wait a while before starting. In the meantime, Brown, Huntington, Shaw and McDivitt engaged in a game of 500,

Huntington and Shaw being victors. Began to clear up about 9 a.m. Starling Bros. decided to go fishing but took no bait. After paddling around for an hour, they returned with no fish, as expected. They must have foreseen some work in taking down the tent. Anyway, they delayed our departure half an hour.

Left the island at 10 o'clock and after a brisk paddle in the head winds, reached the narrows. Here the islands were so numerous that Guide Pelkie ran a little off his course. After about half an hour's circling we found the channel and proceeded to Lady Evelyn Falls, arriving here at 1 o'clock, all ready to eat, as we had had a hard paddle against the wind.

McDivitt and Pelkie prepared the fire, while Chef Huntington got the mountain bass ready. We were so hungry we cut all rations but the one on the jam. We were finally filled up, and as usual had our after dinner rest. Shaw and Brown started to get meat for the next meal, annexing one bass and one pike. McDivitt tried his luck, but could only catch bottom. Tubby then delighted the bunch by his naked dive after it. He was good but the rocks were good too, so we had to leave our troll behind.

Lady Evelyn Falls were just over the Portage, so we packed up and away we went, arriving on the edge of Diamond Lake just above the Falls. Spent an hour sight-seeing and taking pictures of the Falls. McDivitt delighted the bunch by growing so clumsy that he let his left foot slip, landing in the lake, first mishap.

Proceeded across Diamond Lake which was small, but very pretty with its birch woods on all sides. Here we met four canoes filled with boys from the Keewaydin Camp on their way around by Obabika Lake on a fishing trip. Crossed Diamond Lake and landed at Sharp Rock Portage in 55 minutes. It was such a short time since we crossed the last portage that in no time we were started. Pelkie said it was only half a mile but before we were over it, we began to doubt his word. He

forgot to take in the hills we had to climb.

Arrived at the other side in half an hour and beheld beautiful Lake Timagami. It looked so pretty; at least that bay did, with its clear water, and high rocky shores. Sharp Rock was right at the edge of the Portage, rising to a height of nearly 200 ft. and looked like the pictures of Gibraltar. Shaw and Brown were so taken up with the clear water, that they started fishing immediately, thinking they might see the fish biting. They forgot about the logs in the water, and were delayed some time finding out it wasn't a whale they had. Paddled down through the many islands until 6.30 when we came to a dandy camping place on one of them. Our chef announced we were to have mountain bass, brown gravy, potatoes, and two pieces of bread for supper. Everybody thought this enough but Shaw, who was always looking for more. Pelkie and the gang prepared the beds, while Huntington and assistants prepared the supper. It was some meal too. No rations, except on the bread. Even Shaw was satisfied, having traded his crust off the next loaf for McDivitt's.

After things were cleaned up, and a large camp-fire started, McDivitt, Shaw, Starling and Huntington engaged in a game of 500 by its light, Starling and McDivitt being the stars at it. Turned in at 10 p.m.

Saturday—

Arose at 6.30. Had our usual ration of bread and toast; the fish being a bit shy of Shaw's troll, we had to eat bacon. Had our usual after breakfast bath, and McDivitt, seeing himself in the water, went to comb the reflection's hair, and to the disgust of the bunch, lost the comb, so for the rest of the trip, we would have to dismiss that part of our toilet.

Left at 9.30 for Sandy Inlet, intending to arrive at noon. Guess breakfast must have gone to Pelkie's head for we hit for the wrong side of the lake. After visiting every nook and corner, we finally discovered the little channel. He claimed the water was so high that he had no landmarks

to go by, but we saw lots of rocks, trees, islands, etc., so wouldn't take that excuse. After joshing him considerable, we let the matter drop. In our travels McDivitt and Huntington each captured a nice bass for dinner. Ran into two fire rangers where Lady Evelyn Hotel used to be. They scared Brown and Shaw by asking them all kinds of questions.

In the distance we saw our next portage, and to our surprise on coming closer, we saw two women, dressed in khaki trousers, with puttees and everything to match. They were well decked out for the trip, and looked really well in their male attire. Their husbands soon appeared on the scene, each with a canoe on his shoulders. As they were watching us, we showed them what experts we were in following trails, and in no time were on our way across the portage. This was about a mile long, and very steep at times, so we had to take a rest on the way over. Arriving in Lake Timagami again, we had saved about fifteen miles by our portage. Rounded a curve and beheld Sandy Inlet with its beach so much like Lake Nipissing, our play-ground of many years. In the distance was Father Paradea's farm. The first civilization we had seen since we left and a welcome sight, for no matter how much you like the wilds, you are always glad to see a little civilization, and best of all, surrounded by the wilds. Here was an ideal camping spot. Places for the tent and fireplace were all ready. There was a table made of logs, and practically all conveniences for an ideal camp. Set table in style and soon found out we had lost all table manners we ever had, for there was nothing on the table we couldn't reach, and what there was, didn't last long. Bass, bacon, potatoes, and bread completed the menu. A few of us, who had more ambition and sweet teeth than the rest, picked blueberries for our dessert.

We had planned to go to Kee-waydin Camp to see if we could get some more supplies, and of course, thought of Home Sweet Home, and others. Everybody except Pelkie,

1. Mattawapika Falls. 2. Camp on Lady Evelyn Lake.
3. Another View of Mattawapika Falls.

the married man, wrote home. Our writing paper was birch bark, and we made envelopes of the same material, sticking it together with pitch. A very neat job it made too.

Set off at 5.00 p.m. in three canoes. Pelkie and Brown, having something up their sleeves, stayed home. Had no sooner started than it started to rain. It looked like a shower, so kept on going. Made first point, when it started to thunder and lightning, so we decided we had better beach until it was over. Found a smooth rock and landed getting under our canoes. It came down so heavily that we were drenched by the water splashing up under the canoe. It cleared up in fifteen minutes, and a bright sun dried our clothes. Had one dandy run down to Keewaydin Camp on the calm water. The lake is more like a river, having so many islands, and being so narrow in places. Arrived at Keewaydin Camp at 7 o'clock.

Keewaydin camp is an ideal summer colony, with its cottages and tents, surrounded by the high hills on either shore, itself being situated on a heavily wooded island. There were about 100 people on the island, all out for a good time, and by their contented looks, they were having it. Made our business known, and were soon in a little store where we could buy almost anything we wanted. They had no bread to spare, but we got sugar, jam, candies, biscuits, etc. The Chief said he did a wonderful business in the few minutes we were there. The supper bell rang while we were there, so we hung around with hungry eyes. There was no encouragement, so we left at 8 p.m. for our camp at Sandy Inlet, where we expected supper to be waiting us. Had a lovely paddle home, singing all the way. Pelkie said they could hear us miles away, and it sounded better than when we were close.

Our suppers were all ready when we got back, and we were promised bread in the morning, and lots of jam, we cut out rations for first time on trip. Had lots of everything. Our fish supper didn't materialize as

Pelkie and Brown said they had fished two hours with no luck. They promised some on the morrow for sure, so we let it go at that. After everything was cleaned up, had our usual after-dinner songs and speeches, turning in at 10.30 for a long rest, as we intended staying here for Sunday, and there was no reason for getting up early.

Sunday—

Couldn't sleep after 8 o'clock, so up we got, and had breakfast, giving an extra cleaning. Left at 10 o'clock to fish and see Father Paradea's farm. Lake Timagami was too rough for fishing, so took a run up a creek around the farm, crossed a portage to Red Squirrel Lake. Red Squirrel was very pretty, but no rocks to fish from, and as we didn't bring our canoes over, we were at a loss. Tried our best, McDivitt risky, as always, tried trolling off a log out into the lake. Things looked very encouraging for two nice bass followed his first cast. In the excitement of the next cast, he forgot the log was slippery, and much to his surprise, landed in the drink. He was thoroughly discouraged then, and gave up fishing.

Met two Americans and their Indian guides with their canoes and outfits, at the foot of the portage. They were after Lake Trout, and had copper lines and everything for them, as you have to fish down about 600 feet to catch these whoppers. One of the fellows had caught one the day before at 650 feet, weighing twenty-five pounds. It took two hours to land it. How we wished we had brought our copper lines. We had thought we were good at carrying packs over portages, but when we saw the loads these fellows' guides carried, we stopped bragging, for they had easily twice as much as we could carry.

Dropped into Father Paradea's farm on the way back and had a friendly chat with the Father. He showed us all around his homestead, and it did look like a real farm. We then announced the real object of our call. We were after grub. Got carrots, onions, potatoes, and lettuce,

but were disappointed about bread, as the lady of the house said she wasn't baking until next morning and had just enough to do her. As we had caught no fish, and bacon, carrots, onions, fried potatoes, and lettuce for dinner, and believe me, when it was dished up, we had enough for anybody and were glad to lie down and take a rest. Huntington went in swimming with the lads from the farm. Decided to leave immediately, as Lake Timagami had no notion of calming down. While we were packing, along came one of the lads from the farm with a loaf of bread under his arm, meekly announcing forty cents for same. Bread was necessary for us, so we meekly settled the account with a smile.

Had a hard pull across the Bay, then up the creek to Red Squirrel Portage. This was made easily. Geo. Starling and Tom Fell both decided to carry their canoe, leaving pans and dishes behind. This aroused Tubby's ire, for he left them half way over, and after denouncing Gus with words you should only hear in church, sent him back for them.

Crossed Red Squirrel Lake in short order, sailing for about two miles with the wind in our backs. It was just what we had been looking for. Brown kept saying, "If I only had my sail." Red Squirrel is about five miles long, but with the wind, it seemed about two.

Decided to make next portage into Carrying Lake. This went well, with but one mishap; McDivitt's load becoming heavy, he decided he would rest, and set same down on Fell's canoe, which was lying by the path. Then he heard something give. Never thinking, they went on, but on starting across Carrying Lake, Fell thought he must have upset, the canoe was filling with water so fast. McDivitt had put a hole in it. Luckily they had no grub in their canoe. Got canoe patched in fifteen minutes and crossed Carrying Lake which was only about a mile long. We were doing so well, we decided to keep at it, and started across portage to McLean Lake. This time McDivitt was induced under pressure to carry

the canoe, he thinking the grub more important had carried it over the other portages. He did very well, seeing it was his first attempt, getting over the portage, (which, by the way, was the roughest on the trip), without a stop.

Started down McLean Lake looking for a camping place for the night, as we had decided we had done enough of paddling for one day, having crossed two lakes, and three portages, and being in four different lakes, in one day. Nearly crossed McLean before we found a place about one hundred feet in the air. Rock climbing was no obstacle to us, as we had scaled many. Hoisted our tent up, and found a dandy flat piece of rock to pitch it on. About ten feet from the tent on two sides, was a sheer drop of one hundred feet to the lake via several sharp rocks. Found a dandy patch of blueberries here, so with berries, jam, and bread we made our supper. Forty cents a loaf bread at that.

It looked like a dandy fishing spot, so McDivitt and Tubby started fishing, each coming in contact with a large pickerel. Dusk was coming on, so we had to call off operations until the morning.

Basked in the perfect moonlight until 10.00 p.m. and received a severe lecture in regard to walking in our sleep and meandering over the side of the cliff, and then turned in, as we were quite tired. It was so nice, that we forgot to bring in our supplies including the bread. Were awakened in the small hours of the morning by McDivitt, wanting to know who had fallen over the cliff. He really thought somebody had splashed him for his head was soaking wet. Found it was a heavy rain that was falling and his head was under a hole in the tent. Were very much disappointed at seeing the rain, for our bread, etc., was out in it.

Monday—

We were on rations now all right. Got up and brought it in, but couldn't do much with it before morning. Sun was shining dandy when we got up, so put our bread out on the stones to dry, it taking nearly all morning to

do so. Went fishing as per usual, but the fish must have learned since the night before, for we were only able to get another one. This along with the other two of the night before made a dandy meal. Took some snaps and got everything ready for our departure for Anima Nipissing as soon as the bread was dry.

Left our island home at 11 a.m., and proceeded through McLean Lake. For the first time, we were able to get from one lake to another without portaging. Between McLean and Anima Nipissing Lakes is a small rapids which we were able to paddle up, though against a very stiff current. Met two rangers on Anima Nipissing Lake and after telling them we were Canadians, which was all they wanted to know, proceeded on our way to the Narrows, where we were to eat, and stay until next day. Arrived at the Narrows at 1.00 p.m. to find a table and everything ready for us, even to the fire-place. Went fishing, but the lake was too rough, so gave it up. Had a real dinner of onions, potatoes, and bacon. When dinner was over, started exploring, visiting neighboring shores and islands. Had a dandy jaunt, arriving back in time for supper about 6.00 p.m., bread, butter and jam being the lay-out.

After supper, Brown and McDivitt, started to play Shaw and Huntington a game of 500. This seemed tame so, thinking of our stomachs, started to play for a pound of fancy biscuits, best three out of five games. Huntington and Shaw brought home the cakes, three games out of four. Played for another pound, Huntington and Shaw again being the winners, three games out of five. Enough biscuits, so started to play for two dozen chocolate bars. This must have been some encouragement for McDivitt, for he won the first game by a grand slam on the first hand. Pelkie now relieved Brown at the game, as Brown's eyes were sore, and he couldn't see, game being played by camp fire light, with great excitement, all hands being interested, as they were to share in the stakes.

It was nice and warm, so we

decided to sleep out, without putting up the tent. It was a dandy clear night. At 6.00 a.m., Gus, who was under the edge of the blankets, and cold, got up and put on a fire, but it went out as soon as he went to bed again. So we slept until 8 a.m., as nobody would volunteer to get up and start the fire again. The sun shone, however, lifting the fog and warming things up.

Arose about 8 o'clock and had our usual run of toast and tea for breakfast. Immediately Huntington Shaw, McDivitt and Pelkie started to finish their card game, this time to see who would pay for the chocolate bars and fancy biscuits both. The games were so hotly contested this time, that we forgot all about the dishes. The whole crowd were again referees. One game went twenty-nine hands before it was finally won by Huntington and Shaw.

Assistant Chef Fell announced it was 12.00 noon and no dishes washed. Brown and Starling were despatched to clean up while Assistant Chef Fell was appointed Chef pro tem.

Dinner was ready before we were through, but Huntington and Shaw took a long chance, and put the finishing touches, winning the stakes, nine games to seven. McDivitt and Pelkie were then proclaimed as having the honor of buying two pounds of fancy biscuits and twenty-four chocolate bars, with Brown to help in the financing, as he played the night before for a short time.

Dinner was then served. This being our last dinner out, we cooked all the potatoes, bacon, etc. Our rationing had worked out fine with everything except the sugar, which played out before we were through.

Camp was broken up as soon as dinner was over, and we left on the last stage of our journey over Anima Nipissing Lake at about 2.00 p.m. Arrived at the end of the lake at about 2.30 and were delighted to see two bear cubs on the shore. Were delighted still more when we found out that they were tied up. They belonged to the fisherman and were quite friendly while you were beyond their reach. This Brown made sure

6. Just leaving portage at Lady Evelyn Falls.

of. Took some snaps of them and then found out from the Forest Rangers that the fishermen had a lynx tied up. We had heard so much about these lynx that we were curious to see it, and if possible to get a good picture of it. Tried to get the rangers to show it to us. This they meekly said they would do if the lynx were not so fierce especially in the middle of the afternoon after he had eaten and was lying down.

They suggested our asking the fisherman, if he could get it to come out. By this time we wanted to see it, if we had to pull it out ourselves. The fisherman reluctantly said he would try to see if he could get him out. We all got a safe distance away, in fact Huntington and Shaw climbed to the top of a fence, and everybody was ready to run. The fisherman got a long pike pole and began poking under a pile of boards where the chain led to. This failed to dislodge him, so he got hold of the chain quite short and with a quick jerk out came the link and all our excitement. There was only one link on the end of the chain and we didn't know whether to run or not, as we keyed up to such a pitch of excitement. The other link was absent. No one wished to move until the fisherman did. The startled looks on our faces was too much for him and he burst

out laughing. We saw the joke quickly then, though it was on ourselves, and enjoyed it as much as if we had played it. It was too good and too well acted. We then heard the story of how Morrissey and family from Latchford had come all the way to see the lynx. People from Cobalt were there, so we were not the only ones fooled. We immediately packed and began our long portage amid the laughing and joking of everyone about the lynx.

Tubby took the lead and was soon out of sight. We knew it was a long hard portage of two miles, so set to work easily. Huntington was the hero of the portage, going through with his canoe without a stop, though the flies did tickle him and tempt him all the way across.

Tubby and McDivitt made it also, but their loads were easier and lighter to carry.

At the other end of the Portage, met Morrissey and two Indians. This was very tempting for we were within three miles of Latchford, ice cream, beans, bread, sugar, and those chocolate bars. Gus appeared on the scene then, so we persuaded Morrissey to run us down in his launch, seeing we would give him considerable business. He was a good sport and consented to do so. It was a dandy little trip in the cool breezes after our hot portage. No paddling—just going like the wind.

Got a whole new outfit of grub and started back. By the time we got to the portage, everything was over. We were about to hear an uproar from the rest but Gus stood up in the launch with a cone of ice cream each, and their wrath soon melted away. They were real pleased when they saw all our grub, and we began looking for a camping place and an opportunity to demolish it immediately.

Started down Bay Lake and soon found a dandy point. Prepared our evening meal as never before. No rations on anything. Beans, bread, butter, sugar, fancy biscuits, ice cream and chocolate bars, all washed down with soda water and soft

drinks. We were sure the full bunch when we were through.

Latchford seemed so good to us that we decided to paddle down en masse and look it over. So when everything was cleaned up, we left in our four canoes over the calm waters of the lake. Pelkie and Gus excelled themselves by leading us in songs, which enlightened our way over the dark waters. Arrived in Latchford perfectly sober. Everything seemed so sleepy that we decided to waken the people up by parading their two streets and singing songs. Visited the station, Brown and Huntington each talking to North Bay, and announcing that we were all O.K. and sober. The station agent said he was going up to see the lynx on Sunday, so we told him to be careful, and after throwing a great line of hot air, got him real excited. It was with regret that we learned later that he got wise to the lynx and didn't go.

Left at 10 p.m. for our happy home up the Lake. Our merry songs frightened a flock of wild ducks which had decided to camp on the lake for the night. Arrived in the best of spirits and prepared our beds for the last night in camp. Fell did his best to get covered up and asleep peacefully but in throwing his legs around he let one of his feet drop in his eye. There was only one open now, and this was soon on its way to slumberland. Gus decided he needed more blankets. These Brown and Shaw decided belonged to them, and for the next two hours, none knew just what clothes were which. There was no sleep for anybody then. No doubt our shouts could have been heard at Latchford. Think we must have all been afraid to go to sleep for the lynx was only two miles away.

Wednesday—

At 1 o'clock the storm subsided to calm, and by 2 o'clock we were all ready to fall asleep but McDivitt and Huntington who had lost both their blankets. A search revealed none, so everybody cuddled up close and tried to make them comfortable. By a.m. there was nothing but a bunch of twisted legs with a little

blanket showing here and there. In the a.m., McDivitt and Huntington found their blanket up on top of the tent, having been thrown there by Gus. McDivitt decided they needed more sleep, so he got all the blankets together and crawled under. Tubby and Shaw decided this wasn't enough, so let the tent down on them too. They slept until everything was ready, nearly missing breakfast. Made a clean sweep of breakfast and ate everything up as it was our last meal out.

We even shaved and brushed up a bit for we were going to civilization again after an absence of eight days and didn't want the folks at Latchford to know we were as wild as we looked, but preferred them to think that we could look like respectable citizens sometimes.

At 10 a.m., Morrissey came up in the launch and loaded the tent, blankets, packs, and everything and took them to Latchford, and we followed with the empty canoes.

Had dinner at Latchford and five of us came south on No. 2 to North Bay, while the other three went to South Porcupine on Train No. 1.

Above is a resumé of the trip, compiled by McDivitt from the diary he kept while on the trip. It will be noted that McDivitt names the two Starling Bros., Brown and Shaw as being prone to getting out of work. The fact remains that when breakfast was over in the morning and the dishes were to be washed, the tent taken down, the blankets rolled up, and the grub packed that was the time that McDivitt had to write the diary.

The above may be exaggerated in places, and in places the pen could not nearly do justice to the good time we were having, the sheer exuberance of spirits of eight normal healthy young males, out for a good time, with not a care in the world, and the bonds of civilization and convention severed behind them for a solid week of enjoyment.

F. V. WILLIAMS

JUST a wee bit of black and white fur—he was when he arrived at the boys' home via the coat-pocket route of a friend, scarcely had his eyes open in fact, when he was tumbled unceremoniously onto the sofa, from which vantage point he blinked up at the anxious, smiling faces about him.

The boy adopted him right away and carried him to the kitchen where he was treated to a saucer of fresh milk and from that time on he was the boy's especial care.

In six months' time Nimrod was "some" cat, from the sprawling playful, awkward kitten he had developed into a very much alive cat. The boy realized this in the space of a very few short months. One summer evening when he was splitting firewood in the back yard,—his pet was fifty feet away amusing himself with a captured grasshopper—when suddenly the boy chanced to look up and there within three feet of Nimrod was a great gray and white tom cat from just across the fields.

Don't trust your pet with the canary or you may find that your valuable singer has ceased to exist.

He recognized the cat at once as one of the largest and most battle scarred old "toms" he'd ever seen. There was no chance to interfere, for with the swiftness that only a cat can display in an attack, he was upon the black and white youngster. His weight knocked the younger animal off his feet, but to the surprise of the boy his pet threw himself on his back and the fur that was flying for the next half minute or so was not all black and white.

By the time the boy had recovered his wits, the larger cat had had enough and with a bound he was out of the fight and had sneaked away like a shadow into the refuge of the tall grass, that had been his cover in his attack on the unsuspecting youngster.

In the yard back of the house, especially about the old chopping block, there was a regular feeding place for sparrows and blue birds, for after each meal in the house the tablecloth was shaken from the back door and bread crumbs and scraps lodged about in the chips and small sticks making good picking for the

small birds. Nimrod found this out, and he would spend hours at the still hunt game trying to capture one of these birds, but for many days the game always ended the same way, the birds would discover him and the cat would stand up and sweep his tail about as he gazed after the disappearing birds, disgust written on every line of his black and white face, and then he took to hunting in the woods that stood at the back of the field, and one fine day when the boy's mother was hanging out some laundry in the back-yard, the cat approached her and rubbing against her feet and trying in his way to attract her attention, she looked down to see that he had a song-sparrow in his mouth, and that the bird was alive. Now Nimrod was a well fed cat, in fact judging from all the laws of "eats" he should have been satisfied with what he received at home, so the lady thinking she could possibly save the bird's life reached down and patted the cat's head, whereupon the cat lay the bird down on the grass at her feet. Holding the cat with one hand she reached for the bird with the other, and—the bird sprang into the air and flew away, evidently none the worse for its capture.

The summer was well along and the boy made his last trip of the season up the old trout stream and got home at dark with fourteen fine brook trout. He dressed them, put them in a pan of water with a pinch of salt and went in with the others of the family to the dining room for supper. There was a rattle and thud in the pantry, and the boy left the table to investigate. Nimrod had been sleeping under the kitchen stove when the family went to supper, now he was in the pantry with one of the largest trout in his mouth. Did he drop it when the boy appeared? Not he. With a growl that would have done credit to an animal twice his size he bolted for the kitchen, from the kitchen to the dining room and from the dining room to the parlor, still hanging onto that trout and at last he took refuge under the very sofa that had been

his first resting place, seven months before. All coaxing to come out was answered with savage growls and when the family let up with their inducements to come forth he proceeded to devour his fish.

The kitchen broom was procured and the "pet" was forcibly driven from his retreat. The way was clear and he bolted for out-of-doors, and after this performance he was barred from the house. However, there was a nice warm woodshed access to which could be had at any time, night or day. The boy had fixed a warm "nest" in an old dry-goods box and Nimrod spent his sleeping hours in this place. Prowling about the woods half the night and depending less and less on his two-footed friends for sustenance, in fact it was very seldom he allowed anyone to pet him or make much of him, his head was a mass of scars, relics of encounters with those of his kind that he ran across in the course of his wanderings about the woods near the farm houses of the neighborhood.

One day after the first frosts had come the boy went to a moss covered bog a mile or so from the house to gather wild cranberries. They were plentiful there and he had been picking some two hours and was sitting under a bunch of old brush on a bit of dry ground—which was not to be had on the surrounding bog—eating a sandwich, when a slight noise caused him to look up and there stood Nimrod with a large mole in his jaws. He came up and laid it down at the boy's feet and purred and rubbed about his legs, arched his back and acted in every way as proud as any hunter very well could over a successful kill.

Where he had captured the mole and how, was a matter for guess work, but the proof lay before them as plain as the sun in the sky, and when the boy had finished his berry picking and started homeward the big cat followed him the same as a dog would, but the mole had evidently furnished him with a satisfactory lunch as he refused to eat what the boy offered him upon their return home.

Then the winter came, and the boy put out a bait for foxes and he used to go out at nights occasionally and "lay" in the blind built for the purpose, in the endeavor to get a shot at foxes that had found the bait and came nightly for their feed of frozen pork—the bait was a hog that had died of some unknown ailment and was not fit for human consumption, and once after a light snow the boy discovered cat-tracks aplenty all about, and one, a track particularly large, he followed all the way home, straight to the old woodshed, showing that Nimrod varied his diet with a bit of "Cold storage pork", however he did not come near the house, but as the winter wore away his coat became glossy and he actually got fat.

When spring came the family moved. They went away for eight months and the cat was left behind for the very good reason that he could not be found at the time the moving took place. The last of November the folks came back and they had scarcely been home a week when one fine morning old Nimrod put in his appearance, but he sure was a "wild cat" now. No amount of petting or persuasion could induce him to allow the boy to put so much as a hand on him. If food, good food—he was very particular—such as fresh fish, or fresh milk, were placed at a dis-

The picture of meekness in the day-time about the house.

tance, he would taste them, perhaps eat, if he liked it, but no amount of persuasion would induce him to come inside the door. He was in fine condition, old Nimrod was, although across his shoulder just below the nape of his neck was a scar three quarters of an inch wide and two inches long, mute evidence of the narrow escape from the jaws of some hungry fox, but "Nimrod," the pet house cat had *gone wild*. Not because he was underfed or because he was abused, but because by nature he was a hunter and the country surrounding his home was filled with game, small song birds, squirrels, woodmice etc. He could easily live and thrive on his hunting and he

preferred that to being about the house.

We will all admit that cats make pretty nice pets; those who won't admit that much will have to say that you'll have to travel a long way to see anything more graceful or interesting than a kitten at play, or a "mimic" battle between two kittens. It's all interesting but by the same token you can't *trust* a cat, either the four-footed or two-footed species. A cat is a cat, their nature is to hunt, and the purring, lazy-eyed "puss" that's lying around the house a part of the day, is a merciless murderer of nestlings or young birds learning to fly. If you'd like to prove this, put your well-fed, well-cared for cat out on the lawn some day where there is a young robin or sparrow just learning to fly. Of course, this is rather hard on the aforementioned bird, but if you will retire to some spot where you can watch unobserved the actions of your pet cat, you will likely be convinced that your cat "loves to kill for the sake of killing."

House-cats gone "wild," or returned to their natural state, you will find around many a good hunting ground, and perhaps it may sound a bit crude to say a bullet or a charge of shot is the best way to treat them, but could you see what will happen to the first nest of young partridge or quail, or any other bird he discovers, you will sure be ready to shoot, and not only does he kill to eat, but your pet cat will kill for the "fun of it." It's his nature, he can't help it, but that doesn't help preserve the game birds and song-birds of your neighborhood, does it?

All innocence as he comes purring to you.

NEW SPECIMEN OF SQUIRREL

The capture of two white ground squirrels in a grain field at Athlone, Cal., by E. L. Burns of that locality is affording natural historians interesting scope for speculation.

The squirrels have snow white fur and pink

eyes, but in all other respects resemble the ordinary ground squirrels. Burns had seen the two animals many times running about the field and made unsuccessful attempts to trap them. He caught them finally by digging them out of their underground abode.

Editorial Notes

Anyone consistently reading Robert Page Lincoln's numerous articles, that have appeared in Rod and Gun, cannot fail to arrive at one conclusion regarding the well-known writer and that is, that he is one of Nature's children and is blessed with the heritage of the open.

Versatility is one of the pleasing features of his literature. From the scientific style of, "On Making A Split Bamboo Fly Rod," to the soul-inspiring "Ode To A Whip-poor-will," requires a diversity of literary ability that is seldom possessed by modern outdoor writers.

Although practically unknown in the game fields he has been one of the staunchest advocates of clean short and game conservation on the continent. His exposure of the Southern game butchers did more for the protection of the Federal Migratory Bird Law than any other single effort that has been brought to our notice.

It is as an angling expert that he is known to Rod and Gun readers. Fishing Notes Department are eagerly read by Walton's legion of followers, and all are loud in their praises of Robert Page Lincoln.

ESTABLISH FISH CULTURAL EXPERIMENTAL STATIONS.

There is a bill before the New York Legislature providing for the establishment of a fish cultural experimental station at Cornell University. The estimated cost is twenty-five thousand dollars and the object is the better development and utilization of the aquatic resources of state and nation. These

ends will be accomplished by training student in research work and investigating the various problems of fish breeding and propagations.

It would be well to establish a Canadian institution along similar lines; not so much for fish breeding but for the better utilization of natural aquatic resources. In the older and more settled parts of the Dominion the stock of fishes in the natural waterways is sadly depleted through numerous causes, chiefly we imagine through the pollution of these waters.

The good work of the various Conservation and Game and Fishery Clubs throughout the country would be greatly augmented by the advanced ideas and scientific knowledge obtainable from a fish cultural experimental station. The cost of establishment could be borne by the Government.

One of the most modern and best equipped fishing accessory manufacturing plants in Canada is that of Allcock, Laight & Westwood Company at 78 Bay street, Toronto. This old established firm has world wide reputation for excellent fishing products. Their rods, reels, artificial bait, spoons and general accessories are in general demand in Canada and the United States.

Their show rooms in Toronto contain a beautiful display of trophies of conquest effected in various waters of the Dominion.

Their interesting advertisement, that will appeal to all disciples of Walton, is to be found on the inside cover of this issue.

TELLS OF HABITS OF BEAVERS.

In an interesting letter, Mr. James Dickson of Fenelon Falls gives some of the habits of the smaller fur bearing animals. His information is of great interest as it comes from actual experience.

"The beaver, fisher, marten, otter and mink begin to breed when one year old and have from four to five kittens at a litter. As man is their only enemy, they increase in numbers very rapidly. The fisher and marten are not amphibious but receive their food in the same manner as the fox.

"The beaver lives exclusively on bark, favoring poplar, white birch and alder, in the order named. They do not fell large

trees until the supply of the smaller ones is exhausted in the vicinity of their dam. In one instance I found a poplar 28 inches in diameter which they had felled but it was the only one of a number in the same vicinity that they had touched. Even in cases of this kind they only eat the bark from the limbs of the larger trees.

Otter and mink live almost exclusively on fish although the mink will make a meal of a young muskrat should he find one unprotected. Neither the otter nor the mink are ever found far from the water without a good supply of fish. And no class of fishermen know better how to locate and catch fish than this species."

Rod and Gun Folk: Robert Page Lincoln

READERS of *Rod and Gun* will be pleased to make a closer acquaintance with the editor of the Angling Department — Robert Page Lincoln. A life-long devotee of sport in all its varied phases, he has specialized in fishing and it is as such that readers of *Rod and Gun* know him. Although still under forty years of age, he has been quoted as an angling expert not only in Canada and the United States but in the whole of the English speaking world. His articles which appear regularly in *Rod and Gun* represent years of actual experience and research.

Born in Minnesota, a region blessed with a record number of lakes, Mr. Lincoln spent his days of childhood and youth along the famous Minnehaha Creek, known to the Sioux Indians as Little River. Longfellow's poem, "Hiawatha," has immortalized the Minnehaha Falls and it was in this beautiful district that Mr. Lincoln first came in contact with nature.

Breaking into the journalistic game at an early age is an achievement common to our literary celebrities and Robert Page Lincoln is no exception as he commenced writing for the magazines and newspapers at the age of fifteen. His first efforts were directed to trapping magazines. At the age of nineteen he became connected with Trapper's World, a magazine owned by David Edley Allen of Iowa. Outdoor People, started

by Messrs. Allen and Lincoln next occupied his attention but it was merged with Trapper's World as it was not a financial success. Writings from Mr. Lincoln's pen appeared, at this date, in *Maine Woods*, *Maine Sportsman*, *Sportsman's Guide*, *Fur News* etc. He became a staff correspondent of the *Sportsmen's Review*, and is still connected with that weekly. Accounts of out door life activity, written by Mr. Lincoln commenced in *Forest and Stream* of New York at that time.

His next venture was in a new magazine called *The Open* that was started in Minneapolis. In this enterprise he was connected with Charles Lewis Gilman, one of the leading authorities on guns and a trained newspaper man. After six months *The Open* was abandoned owing to lack of support from sportsmen.

After travelling to all points of the compass, Mr.

Robert Page Lincoln

Lincoln is more than ever convinced of the need of conserving fish and game. For some fifteen years he has followed a policy of conservation and is one of the strongest exponents of wild game and fish preservation. He spent valuable time and money in backing the Federal Migratory Bird Law and was the first writer to expose the game butchering in the State of Louisiana. Save the game even at the cost of putting aside the gun, has been Mr. Lincoln's plea for years. Of late years he has turned his

attention to the devastation wrought by the fish destroyers, whose numbers are legion.

Mr. Lincoln is a firm believer in *Rod and Gun* and in a recent letter remarks, "May the readers start

a campaign by which *Rod and Gun* will speedily become a national sportsmen's weekly."

Articles and essays will continue to appear in *Rod and Gun* from Mr. Lincoln's pen.

DOCTOR James Henshall in his well-known book, "The Book of the Black Bass," has stated that, "Inch for inch, the black bass in the gamiest fish that swims," or words to that effect. No doubt Doctor Henshall considered here both the basses; for my part I would say that the small mouth bass is the more game of the two. There is no doubt about it. Anyone who has industriously played both of these fish in their chosen elements will sooner or later find the scales tipping toward the bronzen warrior of the dashing stream. I have often threatened to write a complete book on the small mouth bass alone, and if the pathway is clear to such an attempt I should like to do so. One of the main features I should like to include in that book is a series of photographs showing the bronze-backer in action, from the time the lusty fellow hits the fly-hook, to the time the net slips under him. I know some small mouth stream scenes for a back-ground for such fishing that would do this fish justice. I know waters that have been made immortal by the small mouths they contain, and in such waters I would stage my work. The small mouth bass has been called by many of the old-timers the representative American game fish, and they have stuck to that

through thick and thin. In modern days and for some time in the past the small mouth has been lost track of, most of the attention being given to the large mouth bass and the various trouts. But there are old-time anglers who have been on the path of the rosy-eyed, bronze-backer, the small mouth, for some forty years. When the season opens it is not the trout they go after but the small mouths of the streams; and they use, not artificial minnows and chunks of salt pork, but the "tasty" fly. It may be that some small mouths are taken on floating logs, with countless hooks upon them, and strips of sow belly, but the vast majority of them have liked to sample the artificial fly as it is worked ingeniously through the water by the hand of an angler who is wise and up in the game of winged lure manipulation. Where the small mouth is caught in this manner one is assured of a fight that is worthy of the name and gets at the fine points of the gameness of the small mouth.

Whereas the large mouth bass is taken mostly in the lakes, in more or less still water, (which it seems to prefer), on the other hand the small mouth seems to take, naturally, to the running water, hence has a predilection for the stream, and a sparkling clear stream,

at that. And right there is something strange about the small mouth bass. It loves clear water with a love that amounts to a passion, and will not be without it if it can be helped. I have known cases where small mouth bass have left the waters of a partially muddy stream and have ascended the waters of a tributary stream whose waters have been clear, though comparatively low. In the holes along the course of that stream the small mouth bass fishing has been of the very best. In the respect that the small mouth has such a desire for clear, cold and sparkling water, makes it the closest approach to the trout, (the brook trout in fact), that can be found. Add to this the gameness that this fish shows in taking the artificial fly, and the fight it puts up, quite places it in a class for itself, with marks of merits up and down the line.

Quite different from the small mouth bass the large mouth seems to donicely in any sort of water into which it is placed. You will find them growing large and corpulent in the muddy, weedy lakes; though, of course, these do not put up the fight of the large-mouth that is taken from clear water, in northern lakes. Small mouth bass may be found in murky water, but if they possibly can get away from it, they will. There are fine streams that have become depleted of trout that would make excellent small mouths streams, though of course it is necessary that there be an abundance of feed along that stream's course; but by stocking the stream with minnows, chubs, shiners, etc., the stream could be made ideal.

While the small mouth bass is a stream fish if he can possibly choose a stream to live in, that is clear and clean, still that is not always open to his selection. Like as not he is found in some lake that is spring-fed from the bottom; has been in such lakes from time

untold; a native of the waters. It is not uncommon for the large mouth bass and the small mouth bass to be found in the same waters, though, (save around the spring-holes in the late summer), they do not school-up together. The small mouths keep themselves in one part of the lake, the large mouths in another. The characteristics of the two basses can be seen in this. The small mouths will be found around the rocky ledges, the shoals, the deep spring-holes, and off of the sand-bars. The large mouths will be found up among the weeds, reeds and pads, and in close to shore, sometimes feeding two or three feet from shore. The small mouths

are rarely if ever seen, save if you cup your hands and look down off the ledges, when, if the water is very clear you can look down, as I have done, and see the big fellows moving in and around the rocks. Where the small mouths run down deep in the waters, up to fifty, seventy-five or more feet, it is then that another method of getting them than the

fly must be used, though I have often caught them off of the ledges, rocks and sandbars by sinking the fly with split shot. The live bait man for deep fishing for the basses desires nothing save the live minnow. Your old-time small-mouth fisherman will tell you that there is no lure in this world or the next that is of such surpassing excellence as the young dog-fish minnow, which runs from two to three inches in length. The reason that the dogfish minnow is so good, he will tell you, is that it will last all through a day or more and still be worthy of fishing again. The dogfish is tenacious to a marked degree, which we know to be true. The minnow is hooked right back of the dorsal fin and is allowed to navigate as he will. If a small mouth is near he will nail it on the dot. Don't

pull up the minute the old bass gets the minnow in his mouth, says the live bait fisherman. A bass likes to run with a bait; he mouths it; and turns it as he runs. Give him line, and then, set the hook when he has gone some six or seven feet. This is the live bait part of the game. There are those who laud the two and two-an-one-half-inch young bullhead to the skies as a lure for the basses in the deep holes. Catfishes will do as well. Those who use these for bait clips off the "prongs," or the bones that set into position when a fish nails them. We may suspect that when one of these little bullheads gets to migrating around the deep holes, the bass near at hand, at once get inquisitive. Chubs and shiners have always been lauded high by the live bait contingent for their attractiveness; and perhaps they are as well known as any.

The way one does in hot weather, when the bass are running deep is to locate the deep places. This is done by sounding with a chunk of lead on a line. Where you find the deepest place, there you can be sure the bass will be found. Fish something like five or six feet off of the bottom and the results will be pretty satisfactory. It matters not how hot the day, in the deep holes the bass take fine. Any hour of the day is all the same with the small mouths in the deep holes. I have caught them fine around eleven and twelve o'clock when the burning sun threatened to dwindle me into a grease spot. If one strikes a good small mouth hole he will have the time of his life. It may take some time at sounding with the lead to strike these places but sooner or later they will be found. Of course these places are good year after year so the thing to do is to mark them down by lining up with objects on shore, so that you can go to that place every time without fail. Sandbars in lakes are often told by reeds growing up along their edges. I like

nothing so well as to fish for the small mouths or the large mouths, too, off of the bars and ledges in hot weather, using a steel fly-rod and an automatic reel. By using a six or nine foot invisible leader on which to attach the hook the chances of capture are vastly increased. This makes the lure stand out in the water as though it is absolutely free of any line. In the depths of the lake we may suspect that this deception is startling.

Down in the southern States of the United States I have come across large mouth bass up to ten pounds in weight. Some large mouths have been caught in the south weighing up to fifteen pounds. In northern waters,

however, the largest large mouth bass I have heard of being caught weighed something like eight pounds. Small mouth bass, on the other hand, never run to any appreciable weights. The highest winner on the scales that I heard of being caught weighed a trifle over five pounds. It is my quiet belief that five or six pounds, at the highest, may

be considered the maximum of the small mouth. It is said that when a large mouth goes to weight he is a hoggish glutton, and will load up and load up again on food, and never seems to get enough. I once caught a large mouth of over six pounds that had his stomach plugged full of food and two small bullheads stuck in his throat at the time. But did that bass stop there. He emphatically did not. He must up and strike a dead frog I was trolling deep. The small mouth bass is a far more cleanly feeder than the large mouth. He is not conspicuous for his hoggishness. Hence his weight never goes up the scale. Open the stomachs of your small mouth bass and you will be surprised to find the fare he has accumulated to be mostly small stuff, insects in cases, flies, small minnows, worms and helgramite. If there

are leeches in the stream, be not surprised to find three or four of these digesting in his bread basket. But though the average fair-sized small mouth you get on the hook is a modest-sized fellow, be sure that that fellow in fins can tune up the waves when he gets to sawing and blading the water. He is as gamey as any average trout!

It is the small mouth bass of the stream that is of course the most interesting of all, especially to the fly fisherman because it can be reached, (often most comfortable), with the fly. If you are so fortunate as to know where there is a stream with small mouth bass in it, count yourself supremely well educated. You need not worry about trout. You can have as much sport with the bronze-backed fellow, and by his fight at the leader's length he will imprint a score on your memory that is not soon eradicated. You may have been fishing that stream with live bait and big gobs of angle-worms; with plugs and with spoons. If so, you have known one side of getting the bronzen warrior, but you have yet to know the fly-casting methods and that method is the one that is superlatively worth while. If you bid to try it out just once you will regret it.

Many of the streams that the small mouths are found in are rough-and-racy runs of water. If this is the case, be sure that you use heavier tackle than you do in fishing for the trout. I like the steel fly rod, nine and one half feet in length for this work; prefer that, in fact, to the bamboo, or the solid wood. For taking in slack line with finish and with speed there is nothing like the automatic reel, the reel that is not so heavy, however, that it will disorganize the balance of the rod. Be sure and have a six or nine foot leader. This is a necessity.

"The small mouth bass," says one writer, "is an adept at finding the snags and rocks of the bottom and he fully knows how to use them to advantage. In deep water he will make a spiral dive in an effort to entangle the line around a root or snag, and break it, when it takes a little roughing to bring him up again. The thing to do in fighting the small mouth bass is to keep him near to the surface, to make it a top of the water battle; and this is particularly the case in fast water. This does not mean that the line should be kept so taut that you are in danger of pulling him through the air, like a flying fish, but just the happy medium between taut and slack. Let the rod arch, make the spring of the rod be the force that tires the fish. Keep-

ing the line pulled too strong is about as bad as giving the fish too much slack, as he is likely to make a getaway in either case. As the fish makes his leap through the air, take away the slack, but give him back a little line as he hits the water, so that he does not land on a taut line and tail off to other waters."

In the main this is good advice, though often one has trouble in keeping the fish to the top of the water. It may be said, with safety, that to keep slack away from the fish is the the main thing to guard against. The skin around the lips and mouth in general of a trout is thick and tenacious and once the hook is imbedded therein it is hard to shake it out. With the basses on the other hand, the cartilage around the mouth is thin and rips, so that after fighting a while the hook bend wears a sizeable hole in the cartilage, and this is especially true of the large mouth. If the bass obtains slack line and leaps with a shake, or so, of his head the hook may be dislodged. Therefore in fly fishing for bass, see that there is no disagreeable looseness to the line. The main thing to beware of are the snags, logs and other obstructions in the stream. River fish are acquainted with all of these places, and once they are captured they dart for them with only one purpose in view, that being to tangle or twist the line around one of these obstructions and so obtain enough slack to manage to break away.

Says "Tamarack" a well-known angling writer:

"Simplicity characterizes my humble views of fly variety requirements in the case of bass even more so than it does where trout-fly selections enter into consideration. In the days of my pioneer bass fly angling—and dates back well over forty years—following the teachings of local tradition, I adopted and tied flies of beamy contour and subdued coloration, partaking much of the type of Brown Hen and Governor. A little further on, adventuring into fields of originality (after the way of the novice in fly tying), I departed from the established beliefs of my elders and contrived weird combinations of shape and shade. In the end it didn't seem to make appreciable difference with the bass either. Their attitude appeared to be: *Go as far as you like. We are game!* When the fish were at hand, and on the feed, they never seemed fussy about the particular fly wished on them. And I still find it so. However, intensely it may be maintained by the majority of fly-purist that in angling for trout, especially with the dry fly, the imitation

of natural flights of insects is more or less a necessity, fly anglers, who are, in addition, familiar with the bass will readily grant that in these latter fish the attractive qualities of the lure are of more importance. The colors of dubbing, hackle and wings, which lend themselves best to the alluring appearance of a made-up fly and at the same time possess some degree of resemblance to the natural winged prey of surface-feeding fresh water fishes are found in large measures in the hues of green, brown, yellow and white. Thus with respect to the adaptation of greenish colorings we have the Ferguson, Seth Green and Grizzly King; brown is represented by the Governor and Brown Hen; yellow by the Professor and white by the Light Coachman, Rube Wood, and if one chooses, by the two Parmachenes. Were I confined to the use of a single fly for pickerel, large mouthed bass, perch, calico bass and small mouths I should select the Ferguson on account of its similarity in the water to a grasshopper or a small frog. The size of the fly to be chosen for use is determined to a considerable extent by the stage and the clearness of the water. A stretcher fly alone on a Number 4 hook is proper for general conditions. Where the stream is low and limpid, Number 6 will be found more productive, and there is no objection to adding a dropper to the cast under the circumstances of a reduced size of the fly. There are occasions of high and roily water, and also about sunrise and twilight when a Silver Doctor tied on a Number 2 hook will bring big bass to net. This salmon fly is peculiarly adapted to black bass angling because of its minnowlike aspect. Likewise when through any cause the fish are not taking hold freely the Silver Doctor in the smaller sizes—say 6 and 4—will often secure a rise."

There is a comfortable lot of truth in the above, every word of which I subscribe to. I cannot help but add one fly to the above, that I have found exceptionally killing, that being the Yellow Sally. You could release me on small mouth waters with just this fly and I would feel safe to go up against any of these bronze-back fellows. But, of course, I would want them in the Number 4 and 6 sizes as well as the Number 2 size for fishing around the hours of dusk. A fly that I have used very successfully is the so-called Massassaga fly, which was invented and is tied yet, I believe, by Mr. Walter Greaves, of the postoffice of Ottawa, Canada where a letter or card to him will bring

reply at once. Mr. Greaves is perhaps one of the most finished and skillful small mouth bass fishermen in the North. The Massassaga is tied to a straight-shanked hook, with a green-tinted body; a red ibis tail whisk; guinea feather wings, yellow hackle and a red tuft for a head. Added to my own recommendation of this fly is the recommendation of many other enthusiastic small-mouth fishermen.

To say the very least the yellow and green flies are the very best for small mouth fishing. It is certainly hard to say just what the bass think this fly to be, as it is drawn through the water, played here and there around the boulders, up close to over-hanging banks, in the pools below rapids, close to up-jutting snags, and in other such places where the bass happen to keep themselves. It may be that the fish thinks the fly not a fly at all, of course, but nothing less than a minnow. The delusion of life is conveyed to the fly when, by carefully moving it in the water, the open-and-close action of the hackles and the waver of the wings, perhaps, causes the bass to open his eyes wide with interest. Of a sudden, without thinking, (we will say thinking and take a pinch of salt with it), that bass will nab that "drowned" fly and the fight will be on. After years of fishing for the small mouth I am come to believe that the bass think the fly to be a minnow. If the fly be a green one, of the salmon size, it may be possible that the bass will take it to be a small-sized frog utterly marooned in the wet. I have no doubt this would be very true were that fly played near to the shore.

After one has been at small-mouth fly-fishing for a time he will come to understand that one must know when to set the hook, or there will be ten losses to one capture. One should always be in expectation of a strike and one should set the hook the minute you feel something close in on the feathers. I have heard it said that the trout is the speediest fellow to spit out a fly the second he finds he has been fooled, but allow me to say, (without casting any aspersions on the trout) that the small mouth bass in a close competitor for the laurels in the art of voiding the fly. It is strange here, but nevertheless it is a fact, that many fly fishermen obtain strikes but absolutely fail to be able to set the hook at the right juncture. To be able to explain this is hard; and I doubt if one is able to explain it. The knowing when to strike must be taught by instinct.

"In clear, fine water you will often see the

bass make his dash for the fly," says one writer, "and if such is the case, strike the moment you first glimpse him and that will not be one moment too soon."

As to this I cannot say. Personally I never set a hook till the feathers of the fly are come in touch with; but then the glint of green of the bass and the strike comes practically at the same time.

Many fly-fishermen who have sallied forth for the bronzen warrior of the deep have failed to play their fly deep enough in the water. Even six inches under the surface will not do, unless the bass are actively combing the surface for food and this is rarely the case. One will have far better luck if he will go down, one, two or three feet with his fly. If the water is slow-moving one

is able to get the fly down without any weight to speak of. But there you must fish a little deep you bite on a certain of number of split shot of suitable calibre to the leader and that will take the fly and leader down to a suitable depth. In deep holes you will, as often as not, be forced to go down so far as ten or twelve feet with the fly, but this is a safe proposition, and is often a very killing one. Such is the way one must go about it off of the rocks and ledges of the lakes. Do not draw the fly straight on through the water, but rather work it along with slight twitches of the wrist. This is what wins the big fellows to strike.

In the dusk, as I have stated, use the larger fly.

Also see that the points of the hook are sharp before you go out on the waters!

On Making a Split Bamboo Fly Rod

(Continued from last issue)

This Is The Concluding Installment Of This Article; Telling How To Glue Up The Strips In The Best Manner; Fitting The Ferrules; The Handgrasp.

ROBERT PAGE LINCOLN

IV.—Strip Assembly—Gluing.

ABOUT the time that the planing of the strips is finished the amateur will say, the worst part is done and all I have to do is to glue them together to form the whole. As a matter of fact the worst part of the work is left, for if the strips are not glued correctly, the work done well, there will be trouble, and, perhaps, the loss of the entire piece, or joint. It therefore behooves one to work in a painstaking fashion and to carefully study this chapter for it tells all there is to be told about gluing up the strips.

Dr. Holden says:

"The attempt at gluing up his rod-joints has proven the Waterloo of many an aspirant rod-builder. If the joints can be wound in a single direction only, and this be accomplished while at the same time straightening instead of twisting the joints, such a technic is highly desirable. Any ordinary glue will suffice. The writer has even glued up satisfactory joints with the sheet gelatine that you buy in the grocery stores for kitchen use, dissolved in warm water. Since the advent of the

best-known brand of a prepared liquid glue, which is on sale in almost any hardware store, a practical carpenter or cabinet-maker who in these days resorts to the old-time method of gluing is a rarity. No matter how good the glue, if the joint be not kept protected by a sufficient coating of varnish (when the rod is finished) the glue will not save the rod for usefulness. While the function fulfilled by the glue in binding the strips together is tremendously effective from the increased rigidity of the glued joint as compared with its strips when simply bound together by windings, it is nevertheless true that all the glue has to accomplish is to prevent the strips from sliding one against the other—that is, to prevent the strips from acting individually instead of a solid whole joint when a bending strain is applied. Now, a very slight adhesive force between the strips will suffice for this, when it is distributed along the whole length, and when this bend is reinforced by strong permanent silk windings held in a plentiful coating of varnish. This malleability of the joints, and

just how they act until the wet glue has stiffened, may be well observed in a joint whose finished strips are assembled and held in a snug temporary winding, without any glue having been applied as yet. Both the winding and fresh glue permit the strips to slide one upon another, as you bend the joint; and to remain in whatever was the form when the bending force was interrupted, because they also hold the strips from slipping back into their original position until a counteracting force is applied. Bend the joint into an S-shape and so it remains until bent some other way. Thus it is that this time of gluing up is the most advantageous time for molding the completed joints straight."

The first thing the amateur does when he is ready to glue is to try to glue two strips together, and then glue the third to that. If he does he will have trouble. I have found that in gluing strips, as I shall first tell about, another person will be a world of help. Therefore have a lad, for instance, with you to assist.

The glue to be used is that used by cabinet makers; or the so-called liquid glue, Le Page, will do nicely. I have used this grade in rod-making, and find it perfect; in fact it is now one of the best known glues on this continent.

Any glue applied to rod strips must be hot.

Please remember that fact, so that you will not miss the mark on that account. The second point to remember is that *the rod strips also must be heated*, near a flame, so that they will be almost unpleasant to handle. In heating the glue, place a receptacle containing water on the gas burner, set the glue pot in this and then keep the water first boiling, then simmering. The rod strips are heated just before you apply the glue. Now with a brush clean off the bench around you, sweeping away every bit of dust. Now look at (A) and (B) of Figure XIII. At a convenient place put nails in the bench the exact calibre of the rod at about four places, one to receive one half of the rod, the other the other half. You are now ready for the gluing. The lower strip of (A) is now taken in hand and with your one half inch brush of camel hair, or other hair, apply the hot glue to the heated strip. As rapidly as this is done lay it up against the nails. Your assistant holds it in place at exactly the right angle, flat side up. Now brush a thin coat of glue along the inside of the middle strip; *each side* I should say. Your assistant presses this in place and holds it there. Now the third strip is treated with

glue on its inner edge, and that, too, is pressed down in place. Go along the whole length now and press the pieces together, finally placing a handy, suitable weight (not too heavy) at three points between the nails. These tiny weights should serve to keep the pieces from spreading, making them lock tight. The directions I read stated merely to glue the strips together and lay them on the bench, no nails, nothing to hold them together. Naturally they sprung apart. By thinking it over I improved on the method by using the nails, also adding a pair of extra hands to help me.

At first as the strips lie in the mold (or between the nails, I should say) wipe away the bubbles or drops of glue that have oozed up. Let the strips lie thus for a length of time while the glue thickens, and the strips do not easily spring apart. Your two pieces, the halves of the rod will now look like (A) and (B).

Having gotten so far, the glue having bitten in and thickened between the strips you now take your brush and apply glue to both sides of the upward-facing surfaces. It is best to apply glue to both surfaces. During this performance the pieces lie between nails. Now lift up (B) carefully holding it at two points of its length, then quickly and neatly lay (B) on top of (A). Still keep (A) in

between the nails while you press and arrange (B). Now lift out both of them as they are pressed together. If you have an assistant have him hold the joint at two places to keep the joint together. Now take a thread (Number 25); make a noose, pull it tight near the end as shown in (C). Still letting the assistant hold the joint start spiral winding the rod joint down to six inches from the end. Pull the thread tight as you go, and you will note that as you do pull it tight the strips slip more than ever into place, binding tighter and tighter. Still letting the assistant hold the joint, go over it with your fingers, pressing here and there to make it bind better. Next you do the work without an assistant. Lay the joint on the clean bench and roll the joint, and, as you roll, draw the string tight. Go slowly and be sure that the strips slip into their places. (D) will show you how this is done. Presuming that you have now wound the rod joint from one end to the other very firmly you tie the thread at that end. Now if you glance along the length you will note that the joint is liable to slope the way your spirals are wound. Straighten away from the spirals, and to counteract the spirals that are wound one way, start your thread and wind it the opposite way very tight. All spiral windings of the thread are *three eighths of an inch apart*. Now tie your thread at the other end. In (E) is shown a joint wound one way and then spiral wound back to the starting point. When you have reached this stage you are ready for the final rolling. The first rolling of the joint as you wound it first had the effect of straightening it out. The second spiral-wound thread helped more. The final rolling does the job to a T. Roll back and forth under the flat of your palms as shown in (E). After a while of this rolling the result should be a perfectly straight joint. If it is straight it is ready to put away to dry in a dry place free from any moisture. The joint may be laid between the nails where you started your gluing as these are accurately spaced. This will hold the joint straight. Suitable weights may be placed on it too, if you wish. After a space of time extending from twelve to twenty four hours the glue will have set sufficiently firm so that you can take up the work again where it was left off. Of course the longer you let the joints dry, the better; but you can start in when it has been left twelve hours or twenty-four hours.

The double spiral wound threads are now taken off. There will be glue adhering at all places along the joint. To remove this

you use Number O sandpaper. The *flat surfaces* are lightly sandpapered, touching the hexagonal edges or corners as little as possible. Of course a touch or two along these edges making them a little rounded does not hurt. Thus the glue is removed. If there should be an uneven place at any joint along this joint it can yet be remedied. Hold the joint next to a flame, this will soften the glue. Now take the joint and again roll it. The result will be that the joint will fall straight. If there are little risers, or swells where the nodes are, take these down very carefully, level with the rest, with a fine file, and then use the sandpaper.

Having made the butt joint you glue up the middle joint the same way, and then you proceed to the tip. Like the planing of the tip the gluing of the tip is the most difficult and I find that an assistant in this work will come in very handy. Care must be used so that you will not break the tip.

Points to remember in gluing are:—Keep the glue warm and thin, *never* use thick glue as it is worse than, useless. Heat the strips as you glue them with the hot glue. Wind your spiral thread very tight. For the thicker joints of the rod, the butt and the middle, wind with black thread Number 25. For the tip you can use thread Number 40. Some believe in using cords, but I have never tried cords, using the threads specified.

We have now given directions for *one way* of gluing the strips into joints. We now come to another method.

Secure an iron pipe that is two-and-one-half feet in length, and one inch across. The nearest plumber will let you use his threader. Run some threads at the bottom of it and put on a *stop cap*. (A) in Figure XIV shows the cap screwed on the bottom, and the pipe ready

FIG XIV

for use. This pipe is used as a receptacle for glue, and the glue should very nearly fill it, if not fill it. The glue, remember, must be *thin and hot*. Therefore first heat the glue, and then pour it into the pipe tank you have made. Next a pail of water is put on the burner and heated to boiling. The pipe is set in this and with a wire across the pail is held firmly in place so that it will not totter. As the water boils the glue inside the pipe is kept thin and fit for use. You are now ready to begin work on the strips of the rod joints; this being the *second* method of gluing strips.

The rod joint will still have its one spiral wound thread on it. Leave that on for the present. Now take a second thread and tie it in the exact centre and wind a thread toward the back of the stick very tight, especially to hold the strips tight together in the centre. You are now ready to begin gluing. Now you unwind the single spiral thread so that there is no thread in the rod joint to the centre the other way. (B) of Figure XIV will simplify what the text may make obscure; note the thread spiral-wound both ways, merely to hold that end of the rod tight while you are gluing the other end. The end that is unwound will cause the strips to stand apart, which is the way you want them to do. Now insert these ends into the hot, thinned glue and poke them up and down and turn the rod so that the whole half end of the rod joint (the individual strips) are saturated in the glue. Now, as shown in (B) of Figure XIV begin to wind the glue strips spirally downward, drawing the thread tight. As the thread tightens the rod strips fall into place, and are bound together. You will find that an assistant here is of great value. He can hold and turn the rod while, with your fingers, you work the strips into place and draw the thread tight. When you get to the end of the glued section, tie the thread at the end very firmly and then wind it back to the centre spirally (spirals three eighths of an inch apart), and there, near the centre tie a knot. Now turn the rod joint and take off both the spiral wound threads of that, being sure to go somewhat beyond the glued part of the centre, for, that part being tight you will have missed it in the first gluing, the glue not working in. Now turn this and poke it up and down so that all the strips take on a liberal amount of glue, and then when you are absolutely sure that the centre portion has as much glue inside of it as both the ends, begin to wind it spirally toward the glued end just dipped,

and then when at the end, tie a strong knot, and wind it to the centre. Your rod joint is now ready to be wiped off. Take a half-wet cloth that has been soaked in hot water and very gently wipe off some of the glue, though not all of it. It does not matter if some of the glue adheres to the threads. This serves to hold them tighter in place for the time being. If the rod joint now seems to have a bend or twist to it, roll it under the palms of your hand, and counter-bend where needed. The result will be a straight joint. It is set away for from twelve to twenty-four hours, and then taken out for finishing. The threads are now taken away and with a very fine grade of sandpaper the joint is rubbed down, very, very lightly so as not to injure the enamel. *Don't rub down the corners*, though a little touching up of them, to round them gently, is not a bad idea. In this method, like in all methods, keep the glue heated and before the flame.

When your butt joint, middle joint, and tip joint are all prepared you will be ready to fit the ferrules. These, as stated, must be of the German Silver variety, as none other are worthy of countenance. Seeing that you have the best metal fittings.

In my article on the making of the casting rod I have given my recommendation to the capped and welted ferrule; turn to that article and note the ferrules I refer to. Of course the ends of these you split yourself by means of a fine saw as shown in that illustration. After you have split them they will be called *split* ferrules. The reason of the splitting idea is simply that they will bind to the wood firmer than ever when the winding silk is whipped over that *split* portion. Of course you understand that you get these ferrules, the *capped and welted sort* he referred to, in an unsplit state, and you make the splits with a saw yourself. It is of course a case for using pains. You can't take an old buck-saw and do it with, or chop them down in the woodshed with a dull wood-axe. You need a fine saw for doing it. I presume you can buy these ready-split from the manufacturers; but I have never bought them that way. There is no doubt about it, these split ferrules are so much better than the sharp serrated ferrules that I will not even talk about the serrated sort at all.

The measurement across, of your ferrule as compared with the wood should be as the measurements across the wood at the rod termination, as shown in Figure XV, being from *flat* surface to *flat* surface, from (a) to

(b); never from one point or corner, to another point; therefore, never from (c) to (d) for instance. In setting your ferrules to the wood *never touch the flat surfaces between the points or corners as this mars the wood.* This

FIG XV

is necessary, because the weakest point on the rod is at the ferrules. When fitting the ferrules, you merely trim down nicely and accurately the points, or corners. Then the ferrules with a little pushing slips on to suit, in a very tight manner. In fitting the female ferrule do not push it onto the wood so far down that when the male ferrule is pushed home it will hit the wood end of the joint. To test this out to get it right, lay the male ferrule along the outside of the female ferrule and at the point where the closed end of the male ferrule terminates, there make a mark. Allow a space of one thirty second of an inch between that point, and where this ends there your wood, when pushed in, will end. Many amateurs forget this and drive the female ferrule in too far so that when the male ferrule is pushed in, it hits wood and is only half way in at the jointing place.

You will now be ready for the cementing process. It is needless to make your own cements, since there are so many exceptionally good cements for ferrule fitting on the market. Ask the tackle outfitters for the best grade of ferrule cement that he has. Of course this cement is used for all kinds of rod fitting, for fitting the reel-seat, the reel-block that the reel-seat rests on, etc. When applying the cement hold both the wood and the cement over the flame, heating both, then cover the desired part. Be careful not to get any of the cement on the inner portion of the female ferrule. Now push the female ferrule home to the point on stick indicated, which tells how far you can run it in. You fit the other ferrules the same way.

The ferrule cement should hold the ferrules in place without additional pins; some anglers believe that by driving in pins on the ferrules it weakens the wood at that place. Of course pins, or screws, must be used on the reel-seat. Says Frazer:—

"Procure a small section of hard German silver wire, and a twist drill, each 3-64ths, of

an inch thick. Drill a hole in the reel-seat, and down to the cane, fitting it with a suitable length of the wire, and file off the end flush with the surface. Mark a place at about the centre of the female ferrules, and toward the end of the male ferrules, and securing the joint in a vice, drill carefully entirely through each ferrule, fit pins, and smooth off the ends. When a good ferrule is properly cemented, then pinned through, it should never work loose unless exposed in drying to steam-heated places. Cement alone will hold most ferrules, and this method will answer for the beginner who may not be handy in delicate work, but all of the best rods are equipped with pinned ferrules, and it is seldom indeed that one of them ever comes loose, even when kept in dry places."

I have personally tried ferrules with and without pins and cannot say that one is any better than the other. If the ferrules are split with the saw as I have detailed, if the ferrule cement is laid on nicely, and if the silk is wound very well over the split portion of the ferrule it binds tight and cannot come loose.

One amateur rodmaker has a very unique way of getting around pinning down the ferrules from the outside, and at the same time strengthening the wood ahead of the ferrule, since that is the weakest part on the whole rod. The information contained in this method may interest many rodmakers of the amateur school. Says this writer:

"After the ferrules were cemented in place, I bored a hole 3-32nds, of an inch in diameter into the wood, *lengthwise*, so that the bottom of the hole was one inch further into the wood than the ferrule covered. I did the same with both ends of the middle piece also. Into this hole I drove a piece of spring steel, a common knitting needle of the same size, which of course left a piece of steel one inch beyond the ferrules to support the wood where it so often breaks. Instead of pinning the ferrule to the wood I inserted a screw one half inch long, by one quarter inch wide, at the head of the wood as far as it would go. In this way the wood was crowded against the ferrule so hard that the latter could not be removed without first unloosening the screw and heating the ferrule in the ordinary manner of softening the cement."

I have never attempted this method. I do not know why, but somehow or another it appears clumsy, though no doubt the driving in of the spring-steel knitting needle will have a distinct tendency to strengthen the rod at that point. Of course this is a

take-off from the principle the English rod-makers use of the steel centres. As I have said I have not tried the above method so cannot recommend it. It is worthy deliberation upon at least.

The handgrasp for the split bamboo rod is to be made the same as the handgrasp for the solid-wood fly-rod;—what answers in one answers for the other. I have already given directions on how this handgrasp, (of cork), is made, refer to this. Note Figure II of a past article which shows the moves necessary in making this grasp. In the *heavy* trout rod that I have told about in the very beginning of this article, (which is nine feet, eight inches in length) the grasp (including the three fourths inch reel-seat) is nine-and-one-half inches in length. The grasp is also the same in the *medium* weight trout rod of nine-and-one-half feet—this length, also including the reel-seat (three fourths inch reel-seat the same as the other). The *light* trout rod of nine feet has a handgrasp that is *nine* inches long which includes the same three-fourths, inch reel-seat. When making your handgrasp on your rod make a mark at the nine-and-one-half inch or nine inch point forward of the butt-end. Measure off the length of your reel-seat from the butt end, or extreme taper. Make your round piece of wood for your butt over which to fit the reel-seat, as previously told about, *being sure that it is one fourth of an inch shorter than the end of the reel-seat*, this to allow working your cork down into it when you are fitting the corks. Follow previous directions. Now fit your corks of the decided number, putting on the cement in a hot state. Press your corks down one by one. The first cork is shaped so that it butts up against the pine-wood inner block of the reel-seat, cement, and press tight. The rough corks are first trimmed down carefully with a sharp knife to somewhat like the shape of the finished rod-grasp; next you take a piece of rough, coarse sandpaper and go over all. When this is done you go over it with a fine sandpaper smoothing down all places. The corks should fit snug and tight into both the reel-seat end (and again please remember that you left off one fourth inch on the inner pine block of the reel-seat purposely so that you could sink the cork in to the wood, allowing the metal of the reel-seat to come outside the cork); fit the taper down on the wood the same way and cement both reel-seat and taper in snug. The reel-seat should fit over the block by a little pushing. Don't be afraid to use cement in

making the handgrasp. It is best to make a sketch of the handgrasp on a piece of card board and lay this on your corks after you sandpaper it down.

At this time I do not think it of any use to write about the making of any other form of handgrasp, as I believe the cork-grasp, above mentioned, is the best for all work, and is certainly the best for the amateur to work on. Again the bulk of the trout rods have cork grasps. We need say no more. Some light handgrasps can be made out of pine, fitted with *reel bands*—and a rod having this light handgrasp certainly makes a fine appliance, and it does not, in the least, increase its weight, but then it is not what one would call the easiest made. The independent handgrasp was first exploited in print by Mr. Henry P. Wells. He gave this form of handgrasp his unqualified recommendation in that if the rod took a "set" to it, the rod could be shifted either with the guides up or down. Thus if the rod had been used with the guides down and a "set" in the bamboo through one reason or another had come to be, a positive fact the rod could easily be turned so that the guides would be *up* and the result would be to pull the "set" in the rod, out. Simply, the independent handgrasp disconnects at the taper of the handgrasp and involves fitting a special female ferrule in the handgrasp, with an additional male ferrule on the first joint. While some like rods of this sort, personally I have no time for them and it would, I believe, be unwise for the amateur to muddle with it. Make your cork handgrasp right onto the bamboo, and, by taking great care you will be able to produce results that will so satisfy you that you will care to use no other form. The fact that nine out of ten well-known bamboo rods are made with the corks fitted tight onto the bamboo of the butt joint is recommendation of this method in itself.

The number of guides you are to have on a rod depends, of course, upon the length of your rod. For a ten foot rod about *twelve* snake guides are used, besides the tip-top guide and the reel guide, the guide nearest the reel. First let us get it straight about the reel guide and the tip-top guide. These two guides, by the way, stand the most wear and tear, of the line running in and out through them. It is, therefore, a good idea to have these guides fitted with agate. If you do not want to go to the cost of getting true agate lined guides you can get a very good imitation of agate anywhere among the

tackle outfitters. It is claimed that the trouble with agate-lined guides for fly-rods is that they may be broken. I have never had any trouble in this manner; but I have found out that agate saves line and improves casting. In (a) of Figure XVI we show an agate-lined tip-top guide; in (b) we show the reel-guide, which stands up on two arms, the kind you want to get. The tip-top guide

may be furnished (as may the reel-guide) both in bronzed steel material if you decide to take that. But get the top guide *off-set*, as shown, and get the reel-guide up-standing.

The best sort of guides for the guides between the reel-guide and the tip-top guide are the so-called *snake guides*, which we show in (c) of Figure XVI. This also shows one of these guides attached to the rod at the butt of the split ferrule at the end of the butt joint of the rod.

Get the snake guides in *bronzed steel*; but never get any guides, for *any* rod, in German Silver. Good as German Silver is in all other rod furnishings, in *guides* it is too *soft*. The line wears a niche in them, and they soon become useless. Get *bronzed steel*, if possible. Twelve of these snake guides are distributed along the length of a ten foot fly rod, at uniform distances apart; for a ten foot rod or a nine and one half foot rod the following is the way the snake guides run in size: 3-0, 3-0, 2-0, 2-0, 1-0, 1, 2, 2, 3, 3, 4 and 5. The largest ones are toward the butt of the rod, the smallest ones toward the tip. Note also here that the reel-guide should be size Number 10, or a trifle smaller, Number 9, if you so choose. The tip-top guide of the rod should be a Number 17.

In Figure XVII is illustrated a rod, showing where to place the reel guide, which is ten inches below the first ferrule snake guide. From that point measure to the tip of whatever size rod you are making and at a graduating distance apart place the remaining number of your eleven snake guides.

I have already touched on the making of the silk windings when I wrote on making the solid-wood fly-rod. If you will turn back

and read that you can follow it up nicely. In addition to this we may add the words of Mr. Frazer. He says:

"A split cane rod, properly made and cemented, can be used without windings, provided it is not exposed to actual soaking. Following this line of reasoning, some rod-makers hold that winding a rod does not strengthen it materially. This may be true of rods whose windings are spaced one-and-one-half or two inches apart, but if these are placed one inch, or less, apart, they do strengthen the rod. A rod that is soft in action may be strengthened by close windings, continuously from end to end, in *spirals*, provided the later are spaced about one thirty-second of an inch and not put on solidly. If you are in no hurry it is well to make the windings on the butt of the split cane rods narrow, say twelve turns each, but space them about one-and-one-fourth inches apart, with six or more windings one half inch apart next to the ferrule. On the joint make the spaces one inch, with a similar cluster next to the ferrules, and vary those on the tip from three-fourths to one half inch. I am a firm believer in closer windings near the ferrules, to strengthen the strips there against damage in *twisting*—not that ferrules should be separated in any other manner than by a straight pull. I have great faith in the conclusions arrived at after long experience by Frederic M. Halford. He advocates winding fly-rods *closely*, from one-half to three-quarters of an

FIG XVII

inch apart. In his opinion this increases the steely spring of a split-cane rod, and strengthens wood rods appreciably. He does not state how wide these windings should be, but it is assumed that they are narrow, say, seven threads in width, since wider ones are unsightly.

Note (a) and (b), in Figure XVII, where the joint guides must always be placed, no matter what the length of the rod. The windings of both these guides, to the right of them as they appear in the illustration *must lash over the split ends of the ferrules*. This serves to bind them tight.

What Is Most Alluring To Trout?

America's Foremost Angling Author Gives Some Very Interesting Points in Regard to What the Trout Most Desire in Various Sections

LOUIS RHEAD

EVERY old, experienced angler, has doubtless observed at different periods the rise and fall of various methods in the capture of the trout. From the days of William Prime, when worm fishing for trout was considered a fine art, the evolution has been complete so that the present time finds the outlook on a level basis and in a fairly rational state. I do think, however, the state is but transitory; that we are on the verge of still advancing to get better things, better methods, better implements, and a much more thorough understanding of the fine art of fishing. We shall later see the average angler get nearer to Nature, study the aspects of a trout stream, in all its varied conditions, and become familiar with aquatic insects and other trout food. We shall, in a future time, not be contented just with catching fish, but will rather find, and devote a greater portion of our time in making flies to imitate insects, in fabricating on our leaders, constructing better rods more suited to our individual wants than it is possible to buy. The modern American has a thoughtful, energetic mind, would rather invent and construct tools of the craft in preference to being led by the nose on all issues of that craft, by tackle dealers, their shop clerks, or manufacturers. In other words, he will want things *his way* and not take any old thing offered in exchange for cash. Also if the angler will insist, now and then (a line to the editor will do it) that magazine writers divert their energies to more useful and important subjects than the hoary old controversy—"are bass more gamey than trout." That question has been settled long ago by the angler's own experience. He knows, well enough, bass are more gamey than trout, and also, that trout are more gamey than bass. From the period when dry-fly-fishing was imported from England the method has simmered down to its right position as a mere annex to fly fishing, and its devotees, (of which I am one), have ceased to claim its exclusiveness, and its pre-eminence, as a method.

These preliminary observations to what is most alluring to trout, are intended to demonstrate that the broad-minded angler can

effectively seduce trout at the right time with either worm, wet fly, dry fly or minnow—natural or artificial—equally well, if he endeavors to rightly understand the haunts and habits of the fish, and the reasonable rise of insects,—both being subject to weather conditions, and water conditions. It is fortunate indeed, the four lures, worms, wet fly, dry fly and minnows are equally effective to all species of trout, no matter whether they haunt the waters flowing to the Atlantic, or to the Pacific. Of the latter, the most popular are the Rainbow, Dolly Varden and Cutthroat. Of the former the most abundant are the Speckled trout, Brown trout and Rainbow. But the average size of the Atlantic trout run much smaller, for a five pound Rainbow caught in the East is considered a giant. The same species caught in the West, from ten to fifteen pounds weight, is a common event. In every instance I allude to fish captured in their wild habitat. I have no interest whatever in trout reared and fed in captivity. I am fully aware that wild trout may be captured on other lures than the fly, worm and minnows, but the right choice of them for the proper time, and place, the care and skill used, are the things to achieve success. To quote from Prime's, "I go a-fishing," wherein he says: "The piscatorial dilettante is fond of condemning worm fishing as a low business. I differ from him. It is a fine art, and in all the classics of our art has taken high rank. If the test be found in the amount of skill required for its practice, then, without dispute, it ranks as high as fly fishing." He further says, "the angleworm is your main reliance, but if that does not take, try the tail of a small trout, or bright-colored-fin. Sometimes nothing is so taking as a grasshopper; at another time the eye of a trout, and often the red gill attract large fish." The baits here mentioned are as truly effective to-day, for the three species of trout in any locality of Eastern waters. The case is different of Western trout, because of the wide range and different climatic conditions from Southern California to Alaska. In rivers near Butte, Montana, Rainbows of

large size will take four inch bullheads and monster stone-flies, while more south, grasshoppers, caterpillars and even crickets are popular baits. East or West, minnows of various size and species are alike considered superior bait for big fish. Naturally so, when are considered that minnows furnish 90 per cent of their diet. The most effective use of flies—wet or dry—is purely a local matter to the streams you fish; that is, if your intention is to choose your flies to imitate the insects upon which the trout feed where your fishing is done. If you are not seriously intent upon the higher art of fishing and consider it sufficiently satisfactory to play the “chuck and chance it style,” i.e., casting anywhere, in any old way, (with commercial flies that are simply a bunch of colored feathers that imitate nothing), your chances are far less certain of good results either for fish or fishing for pleasure. As before stated, it rests entirely with the angler himself what he wants, and what he gets. Certainly the difference is real pleasure and results between the two is very wide, indeed, so much, as day unto night; as water is to wine.

I don't suppose any angler with a knowledge of the rudiments of fly casting could fail to cast a dry fly properly after a few hours prac-

tice under a competent teacher. Success comes quicker in the use of proper tackle, a tapered line, tapered leader, at the end of which is attached a single cock-winged drake fly. The same proper tackle applies to wet fly fishing, a tapered line and gut, at the end of which is tied a lap-wing dun, or upwing drake, is immaterial; but the two other flies should be graded larger in size as tied up the leader two feet apart from the end fly. These three wet flies should be allowed to run in mid-water fifty or more feet down stream while you wade the middle. As a rule this method is more successful to get a full creel than casting across stream from the bank to float down stream below to your side. If insects are rising from the bed of this river to the surface, then also, on the wing in the air, and your flies are a fair imitation of them, the chances are better, whatever baits, natural or artificial, are employed. The only time when the dry fly method is really more effective on a running stream is at the tail end of large placid pools, or perhaps at the head of the pool. All depends upon the surface conditions and depth. If a long pool is shallow at the head and tail end, but deep at the middle, fish the middle. Your own best judgment is the only guide as to methods and baits most alluring to trout.

Camp Facts

A Few Things to Remember When Going on a Camping Trip, also Some Conveniences that Will Help to Make the Trip What it Should Be

ROBERT PAGE LINCOLN

SOME people break away from the ruts of life long enough to leave the confines of the city, to set a tent somewhere beside a stream or a lake, or in some woody glade, there to spend a summer camping out. The majority will spend only a few weeks next to nature. Anyway you look at it this breaking away from the clutches of civilization is a fine thing, and helps to make life worth while. Most people have the notion that to enjoy the beauties of nature, and to really have a fine time of it, one must penetrate to Hudson Bay or squat under the Circle. The truth of the matter is that anywhere outside of the average Canadian or Northern-State-of-the-Union city one is able to find as fine camping grounds as can

be imagined. There are places near any city where things will be comparatively wild, and, too, by camping in such places one is able to draw upon farmers near at hand for provisions. The man or men who go far from the cities, into the wild places, leave behind them some of the comforts otherwise easily attained although, admittedly, they do see more of nature sculptured out of the rough, and of course they get better all-around fishing and hunting, as the case may be. Nevertheless there are places close to civilization where excellent fishing is obtainable, and where a camp will shine out in as much glory as though it were thrust away three hundred miles from civilization. It is better to camp out on a wood-lot on the

outskirts of a city than not to camp out at all.

Camping out can be made a difficult and disagreeable thing if one chooses to outfit in an inferior fashion, if he sets up his camp in an ill-judged manner, and if he selects the wrong place where to do this. If a party of three or four decide to camp together they can make the camp large in proportion, and by a little ingenuity can arrange a mosquito-netted summer kitchen in front by running the fly out over the front. If it is possible to arrange for a board floor to your tent so much the better. Then you will have a perfectly dry affair, throughout, and you will have no trouble making ditches around the tent with a shovel to run off the water. On the board floor a carpet can be laid with very good results.

It is pretty hard to camp without the liberal use of mosquito netting. Anyone who has tried it, never tries going out again without a suitable amount of netting along with him. The netting, (used in the right place) keeps out the winged pest. When you lie down to sleep with not one mosquito inside of the tent but with thousands buzzing around outside, trying to get in, you will vote the inclusion of this netting one of the best ever.

Never thrust a camp away amid the undergrowth. Rather locate it in an open spot among some small trees, with the woods some thirty feet away as a background. It is not best to put it away entirely in the open where the sun lights fully on it. Rather have it so the branches of the trees half shade it

creatures, and when making the way to the lake in the morning it was impossible to do so without getting wet from the heavy dew that drenched the bushes. A camp set upon sod is the ideal way, as the sod does away with the moisture coming up from the ground. Sod once dried makes for a healthy floor to the tent—as good a floor as can be found. With the canvas stretched over this no trouble is experienced.

The camp should be so arranged when set down that the drainage is good; and this is especially to be desired if there is no board floor to the tent, in which case there is need of ditches around. If the tent is set on a sort of a slope the rain will sooner or later find its way in. The ditches around the tent should not be dug close up to the sides, but under the fly along the ground. If the drainage is good there will be no fear on your part of being flooded out, for what the ditches will not take care of will be handled by the natural drainage of the ground.

Cooking in camp is not without its little trouble if gone about improperly. If you are not afraid of the cash and you are able to pick up a very nice camp stove, and if the transportation is not a troublesome matter you may be able to take along a little cook stove. If there are stores handy, so that you can readily obtain kerosene, you may be able to take along a kerosene stove, of which there are those made with one burner and three burners. Or may you wish to eliminate these all altogether in which case you will be able to bake bread, right before the fire in your reflector baker. You will need, however, some affair for cooking over, and frying, etc. If

during the day. I once had a camp deep in a woods, but I will never do it again. In that dank jungle there were billions of winged

you have a permanent camp with the aid of cement you can make up a fire-place such as that shown in Figure I. A fire-place such as this can be readily made by just piling the stones up all around, but if you mean to stay on that one place through your whole stay then I would suggest that you mix up mortar and make a real fire-place. If you are able to slip in a half sack of cement when the wagon pulls out, all well and good, you will not regret it. But of course, this is only providing that transportation is no inconvenience; if you go light, the cement, a half sack, will weigh fifty pounds and is not to be considered of course, save if you have the means of bringing it in. If you have the cement mix up the mortar and cement in the stones as shown. The top of the fireplace is a piece of sheet iron. Spikes are inserted around the edges, here and there, to reach down into the mortar. When the mortar has set the spikes are held in place very firm, thus holding the sheet iron top from going out of place.

If you have access to to a sack or so of cement you can make a more elaborate fire-place in which you can readily enough make your bread in a manner I shall tell of here. The inside of this fire-place can be the same as the one I have just spoken of, say three or three and one half feet square. Like the walls of the previously mentioned fire-place make them about eight to ten inches thick and sink them down in the ground about four or five inches so that all will be firm in place. Never make a fire-place of this sort on light leaf-mold ground. Preferably have this fire-place on solid ground. The walls may be one and one half feet high. When you have the sides done and the sheet iron with the spike through it in place then plaster up the sides nicely with cement mortar. Now dig down so that you reach the bottom level of the walls (this, by the way can be done in the beginning). Put mortar on the floor, and then sink into it flat stones, and then cover that over with mortar, ending out by making it a little smooth. You have previously accumulated some clay. Mix this up a little so that it is workable and spread that onto the top of the green cement to a thickness of two inches. If you have blue clay that is the best. If the only clay you can get hold of is the common yellow or reddish clay, use that, but wet it up and mix cement with it for a binder for the reddish clay is not so strong and binding as the blue. Now spread this over the cement, two inches

thick, as I have stated. (If you can obtain no clay, smooth out the cement on top of the flat stones, level, and this will do.) Under intense heat the cement is liable to crack. The clay should bake as hard as a brick.

Now then you have your three sides smoothed up nicely and the clay floor to the fire-place also smooth. Now the idea is to bake the clay floor. It is, however, best to let the cement throughout the whole set firm before you bake the clay. To bake the clay floor start slow fires, and then increase them until in the end all is red hot. Remember, *slow fires at first for a few hours* and then hotter fires after that. The result of this baking process should be a perfectly firm floor.

When you are ready to do your baking start a good fire in the fire-place, so that it is nearly red-hot. Oak wood makes a hot fire. Now scrape out all the coals and brush the floor of the fire-place clear. Throw some flour on the floor and if it turns brown it is the right degree of heat. Now have your bread dough in the pans, and set them in on the floor of the fire-place; close in the front *tight*, and also close over the hole in the sheet iron top where the smoke comes out from. Thus with the sides the top and the floor hot, the bread will soon bake, doing a fine job. Small loaves of bread, baking powder biscuits, cakes, etc., can be laid on large leaves. Bass-wood leaves are very good. Lay these leaves with their dough on them, on the floor of the fire-place and they will speedily bake. Be sure to have the front closed in, and the top covered so that none of the heat escapes. That is the secret of baking in this manner.

If you are near a clay bank there is a dandy way, (much like the above), in which to bake bread that I deem it well to mention. Cut into the bank, making a hole one and one half to two feet high, and three feet wide, and three feet from the front to the back. Preferably make the top arched as it won't be so liable to cave in. Smooth the floor of this, and then by a steady firing you will be able to bake the top, walls and floor as hard as brick. You have no chimney to this, allowing your smoke to come out in front. When you wish to bake, get the clay nigh to red-hot, then scrape out all coals, and brush the floor. You can bake the bread by laying it right on the floor, or in tins. Close in the front very tight so that all the heat is preserved.

The good point about the fire-place with

the sheet iron top is that you can cook over it and bake in it too. The clay-bank baking place is used only for baking.

The sheet iron top eliminates the usual trouble in cooking over open fires, where one approaches his task with a half heart, and really never makes a thorough job out of it. The trouble with cooking or boiling over an open fire is that your fire is either too hot, or not hot enough. On the sheet iron top all this trouble is done away with. The old way of boiling and camp cookery was not complete without the smoke-stained coffee pot that one could not lift out of the fire save with a brace of sticks, dumping out half of the coffee as the attempt was made. If the coffee pot was, or is, a poor one the handle comes off thus adding to the "joys" of cooking over the picturesque open fire.

A few remarks here about the water supply and how to obtain it will not be amiss. Many campers use water from streams and lakes without straining it, or without boiling it. Deliberate harm will not always come from this, but there are, and have been times, when there has been harm done. Don't scoop out water from any hole and expect to get away with it. Clear, clean water is in demand, and, because, with a little ingenuity it can easily be obtained, I suggest that the directions I give may be helpful. It has accurately been said that in a lake the clearest, cleanest water comes from near the bottom, at least in the depths. It is the surface water that gives up the refuse and the scum, and as the lower water yields up any of this it does not remain in the depths but comes to the surface. The result,

it can readily be seen is that the depth are always clean. Also the deeper down you go, the colder the water. The surface water may be warm, but deep down it is most agreeable. How to get water from the depths is, therefore, a desirable thing to know. In Figure II we show an ordinary bottle with a wire harness firm around it let down into the depths which is done by connecting an iron or stone weight to the bottom as shown. A strong cord or green linen fishing line is then attached firmly to the cork of the bottle. When your bottle is down deep enough the cork is pulled, after which the bottle fills, and you pull it up. Since the bottle is full coming up, no other water gets in. In this

manner, even on the warmest days, you are able to get hold of a cold bottle of water. Especially in spring-fed lakes can cold and sparkling water be brought to the surface in this manner. I have spoken of the small bottle. If you desire a greater quantity, use a five gallon can, (milk can); have a sufficient weight to it, and a wire to the can cover. Don't jam the cover down too tight, or you will not be able to pull it out. Just have it sit in tight enough so that it will make the trip to the depths without coming out. With a little care two people can readily hoist up a large can from the depths.

Never use the water right around shore, either for drinking or for cooking. Get good water, with the can, as I have outlined. Many take the shore water and strain and boil it but this usually is great deal of bother. Water from the depths it is not necessary to boil, though it should be strained which is easily done by running it through a tight cloth. To keep the water cool have a hole dug in a shady place and sink the can in this two thirds of its length. As I have stated a milk can makes one of the finest receptacle one can think of for holding the water.

I have mentioned one way of getting the water supply, but it is not the only method I know of—and this is a one not commonly in use. You obtain a barrel for the purpose in view. This barrel should be a former molasses or sugar barrel, thick staves, not of the common thin, cheap type for barrel. The molasses barrel is excellent for the purpose. Where the staves meet along the centre of the barrel, make thin openings, here and there; cracks, in other words. When you have some of these all around it will be ready to be used.

Now bring it down to the sandy beach of the lake. Dig a hole one foot from the water

Fig III

edge the same size as the barrel and two thirds of its height. Sink the barrel down in this hole and then tamp the sand down around it. It will not be so very long before the water will begin to seep in through the cracks to fill the bottom of the barrel. This water is clear and clean, for the simple reason that it has worked its way through the sand into the barrel. The result is sand and gravel-filtered water. Keep the top covered over with a canvas cover that will just fit over it like a cap and thus nothing will come into it in the shape of insects, frogs and turtles. You have here clean water at all times; in fact as clean as sand can purify it. Figure III will give an idea of how the barrel is sunk in the sand at the lake shore.

Passing on from the highly important system of getting the water for the camp we come to the cooler, where the various food-stuffs are to be kept. There is a clumsy, disagreeable, absolutely impracticable method of digging a hole in the ground and keeping the various perishable foods in a box that fits into that hole. After one has been through a couple of rainstorms and has fished out the floating butter and dead frogs, he decides that some other method could be used. But how? No one seems to know any other method.

Figure IV shows a burlap cooler that has been tried out and has not been found wanting. It is absolutely clean, practical and rain or shine is on duty. This cooler may be made in any size you desire from being two feet square and three feet high to any other dimension desired. One three feet high and two feet square is enough for three camping out in a wall tent. In this affair

you will be able to put in all that you are possibly using and keep it in the very best of condition. You simply make a framework for this cooler out of two by one strips as shown in (a) of Figure IV. The top is boarded across, complete so that a pan can sit on it as shown in (a). At an equal distance from top to bottom, fit in more two by one strips. Three of these shelf-strips are about right. When these shelf-strips are fitted in place, tack on porch wire-screen so that it will be tight in place, and unyielding. On these shelves the food is to be placed.

The entire front of this cooler is done as shown in (b) of Figure IV. When the framework is done burlap is hung from the top of the cooler down on all sides. Along each corner have buttons. Thus one side buttons onto the other. The pan at the top is filled with water. The burlap before it is hung up is saturated with water. It is then stretched into place and buttoned up, and the tops of each side of the burlap is placed in the water in the pan at the top. This wet burlap acts very much like a wick. It keeps drinking in the water in the pan, thus conveying it downward along the sides of the burlap, keeping the burlap wet as long as there is water in the pan. The wind passing over and around the burlap keeps it cool within. Of course this cooler should be set in the shade, never where the sun can get at it and should preferably be nailed to some solid material. The burlap must be wet before you place the top ends of it in the water. The door buttons along one side, and top. Thus you unbutton the side and top over the door when you wish to open it. It is not necessary to have this

Fig
IV

connected at the top with the pan to draw water. Simply keep the door wet. With three sides drinking water that will be plenty.

Personally I am not much in favor of the method of buying a camp outfit complete, knives, forks, plates and so forth; thus you often buy a camp stove and get the complete utensils along with them. These utensils are usually of inferior material. You can go around in the five and ten cent stores and pick up all the materials you need for a camping trip. It is

owner of this humble, inexpensive camp told me:

"A person does not begin to enjoy camping out till he has camped out from spring till autumn. A camp is not a camp unless one gets busy at odd times and makes his own chairs, seats and so forth out of trees and saplings. Rustic furniture make camping out plump full of interest."

Anyone with an axe and a sharp hatchet can make his own furniture, chairs and so

Fig V.

usually well to have enough of each, as regards utensils, so that if some are lost you have the means to replace them without any trouble.

Be sure and have a good axe along, and a small belt hatchet, also a good, strong, broad-bladed pocket knife for cutting purposes of all kinds.

I once spent seven months in a camp a long time ago. It was there that I first had a look-in on the joys of true camp-life. The

forth. It takes but a little time and it certainly is worth while. In making a chair you can weave willows or limber branches in for the seat and the back to make an elegant affair.

In Figure V, I show some drawings of camp things made rustic fashion that should be interesting. In Figure VI. is a platform up in a tree, with a ladder leading up, that should also win the eye and the heart at a glance. All of these are drawn from the real thing.

The letter (a) of Figure V shows the framework of a chair. Sticks can be tacked across, or the back and the seat can be woven in with willows or limber sticks. The letter (b) shows another chair very simply made. A glance should tell you how. The letter (c) is a stump sawed off, the roots forming the chair legs. In this case boards are used for the seat portion. The letter (d) points to a crotch on a tree sharpened and nailed up to make a hook to hang things on. If you have been bothered with trying to hang up four hundred and fifty-two things on one small nail this idea will be a blessing. The letter (e) is something on the same order, only having three wooden hooks.

By a little ingenuity you will be able to guess up hundreds of things like this that will really be a comfort, and will truly be worth while.

The good thing about the platform in Figure VI is that on sultry nights one may spend a comfortable evening there, at peace with the world. While the mosquitoes are liable to make life miserable close to the earth, where these winged pests keep themselves, the higher up in a tree you go the fewer mosquitoes you will find. We once erected a tent over a platform as that shown in the drawing and never lived more comfortably. Around the edges of this platform one may tack on wooden boxes a foot square. These boxes are to be filled with earth. By planting morning glories in these you will make a very nice screen of greenery.

The platform shown in the drawing, (which is made from "life"), over-looks a lake, permitting of an unexcelled view.

GUNS & AMMUNITION

Keeping Your Powder Too Dry.

JOHN LYNN

IF you think you can take your rifle at any time and lift a squirrel at fifty yards without fail, don't read this article, for it might destroy your faith and your joy in that gun. The joy of the writer in two rifles was killed a long time ago, and he understands what an ugly business the killing was. If, however, you are one of the many who often find a well-aimed bullet going astray, a possible explanation may be found there, for this is the meat of a report from a man who has been exceptionally placed to find out about one reason for rifles missing what they are pointed at. In fact, he wanted to call this article "Why We Often Miss."

Faith in a rifle backed by practice with it and by a natural aptitude for shooting is a good thing, but too much faith will not work out in practice and automatically kills itself. I pull a dead bead on the head of the same tack sticking in the same wood house once each week for season after season, how far from the tack could I expect the bullets to scatter? It is part of what the rifle *can't* do that is to be pinned down this time.

Many think of the rifle barrel and the bullet as the only features that can effect accuracy very much, overlooking the part the powder plays. The smokeless powder with which all modern cartridges are loaded has some odd qualities that the makers do not advertise. Some of these are shared by black powder, but not all.

There is the matter of moisture content of the powder, for instance. When smokeless powder is made, one of the final operations is to dry it in specially constructed kilns. This "drying" is not what we ordinarily understand the word to mean, but a careful

lowering of the moisture in the powder to a certain amount, and an equally careful keeping of what moisture remains. When the powder is "finished" therefore, it absolutely must have a certain percentage of moisture.

This percentage is set by the chemists at a compromise figure. Doubtless the powder would burn better and develop more force if it had no moisture at all, and doubtless practically all moisture could be taken out of it in the kilns, if desired. But smokeless powder draws water worse even than dry lime or dry salt. If it was perfectly dry, it would soak up water from the very air and within a few hours after it left the factory it would contain a varying amount of dampness that would depend on the weather. Some lots would have a chance to stay dry; others would get very damp. The amount of moisture left in the powder, therefore, is set by the chemists at the amount they think can be kept with least increase or decrease under average storage conditions.

These amounts vary with different kinds of powder or brands, and the exact figures are not given out by the powder makers. For explaining the effect of its moisture content on the shooting of the powder, however, any figure will do. Therefore to serve the purpose the figure two percent may be used. Our smokeless powder, fresh and clean from the mill, we will say contains this amount of moisture, and its behavior under field conditions is to be noted.

The first thing done with a new lot of powder is to test it by shooting, to see what charges are needed in the various guns to which it is suited. The powder makers do it and the cartridge loading companies do it.

using instruments that tell the speed of the bullets. Each cartridge and rifle has a standard velocity, (as 2700 feet for the U.S. 30-06 cartridge and about 2000 feet for the 30-30.) When a new lot of powder is tried they simply use enough of it to give the required velocity.

The average shooter will be surprised to learn that in spite of all the makers can do different lots of the same powder vary in

51 grains to do the same. The standard charge of this powder and gun is supposed to be about 48 grains.

The tests are conducted with the regular amount of moisture in the powder, it must be remembered. The powder is stored for a while and is shipped here or there. It gathers more moisture if it is in damp rooms, or dries out somewhat if near steam pipes.

Further tests made then disclose that each

Two ten shot groups fired at 50 yards to show the effect of moisture in powder.

Rifle 30-1906 Springfield; bullet standard 150 grain 30 caliber; powder du Pont No 75, charge based on 15 grains.

The powder was divided 48 hours before the test. A few ounces was poured out of the regular one-pound canister into a tin box without a lid, and left in the damp air of a cellar, till just before it was fired.

Loading was done immediately before firing. The Ideal measure was set to throw exactly 15 grains weight of normal dry powder out of the regular can. The damp powder was put through the same measure without changing the adjustment, but the charge weighed $15\frac{1}{2}$ grains, proving that the powder had taken up $\frac{1}{2}$ grain weight of water to each 15 grains of powder, or more than three per cent instead of the $\frac{1}{2}$ per cent mentioned in the body of the article. (Of course under unusually damp conditions.)

The firing was done with one adjustment of sights; the ten cartridges loaded with the dry powder first. The top group, marked A on the target, is the one made with the dry powder; and the bottom group marked B on the target is the one made with the damp powder. Group A is only 1 3-8 inch in diameter; group B is $2\frac{1}{4}$ inches. More important, every shot of group B is below the lowest shot of group A, and the average striking point of group B measures 1 5-8 inches below the average striking point of group A.

strength so much that charges from some lots have to be several grains in weight heavier than charges from other lots. U. S. Government pyro powder, or du Pont No. 20 as it sometimes is called, has been used by the writer which required only 44 grains to give 2700 feet velocity in the Winchester Model 1895, 30-06 rifle, and again other lots of the same powder has been used which required

change of a tenth of a percent in the moisture in the powder shows up in the velocity perceptibly, while a change either way of so much as one half percent may make a difference of 50 to 100 feet in the velocity. The water cools the temperature of the gases as they burn, reduces their volume, and cuts the pressure behind the bullet. One half percent of the weight of the powder in a 30-30 shell

makes a drop of water about as big as a pin head.

The extreme range of a 30-30 rifle probably is about 3000 yards. This range is obtained at the standard velocity. If the powder used contains less moisture than when it was tested, however, the bullet will have a little more range, while if it contains more moisture, the bullet will fall short. *One half percent additional moisture probably would make a 30-30 bullet fall short 200 to 300 yards, and likely would take 400 yards off the extreme range of the 30-06.* If the fall is measured at 500 yards, the 30-30 may strike two or three feet lower, and the 30-06 a foot and a half. Even at 200 yards the bullet is lowered enough to miss most game and to miss a bulls eye. As for the tack head mentioned in the beginning, the bullet might be half an inch or so from that, though decreased velocity shows up most at ranges beyond 150 to 200 yards.

Smokeless powder therefore must be kept absolutely air tight after its moisture and velocity test if it is to give without fail the same results as when first tried. In actual practice it is not kept air tight, and does change its moisture content. The man who reloads his own ammunition has most to contend with. The powder cans have small air leaks along the seams and even through the body. The screw cap at the top is not fitted with a rubber washer. As the air outside and inside the can changes in temperature, it contracts and expands, which causes a current to suck through these holes. To see how much water the air carried, one has only to look at the drops which condense on the outside of a water pipe during some kinds of weather, or at the vapor that gathers sometimes on a window pane.

Factory ammunition is by no means free from the same trouble. To begin with, the powder is open to the air while it is being loaded. Then the cartridges seldom are air tight. The Governments like to apply some shellac about the primers of army ammunition and sometimes even about the bullets to shut out all the air, but sporting cartridges are never given this extra precaution. There is a flow of air through the holes about the bullet and about the primer, which, small as it is, is capable of introducing an extra half percent of moisture into the powder charge during a few weeks. Every hunter knows how cartridges are warmed up in a pocket, then laid overnight where they are lowered to zero temperature. Again they

may be laid on a dry shelf for months, and finally will be taken out and perhaps carelessly dropped into the snow. The result of all this is that after cartridges have been loaded some weeks, or powder stored for that time, there is no knowing in advance just where the bullets will strike. *Perhaps storage conditions have been just right for holding the original amount of moisture.* Then the bullets will strike at normal elevation. But perhaps storage conditions have been something else. From this cause alone it is not hard to predict what happens to the man who thinks he can pick up any ammunition and hit at all times any small object he aims at.

Yet the moisture content of the powder is by no means the only feature that effects accuracy or striking point of the bullet. Another is how full the charge fills the shell. The powder makers usually call this "density of loading." To put the matter more accurately, what is meant is the proportion of air space in the shell after loading compared to the space in the empty shell. No charge of powder can be *solid*. Some air always is to be found between grains. Smokeless powder also has air in the holes through the tubular grains or in pores in the fibrous grains. Quite often, also, the charge of smokeless powder does not entirely fill the shell.

Now, air has a great influence on the burning of the powder. The more air the charge has in the shell, the slower it will burn and the less pressure it will develop, hence the less bullet velocity it will give and the lower striking point it will give. With reduced air it burns faster, hotter, stronger. It follows that when a charge is increased to compensate for moisture it may have taken up, the extra two or three grains added to the charge may drive the pressure and the velocity up at a rate that looks unreasonable. There is an exact relation in every cartridge between the bulk and weight of the normal powder charge on the one hand, and on the other hand the space in the shell, the bullet, the barrel and the primer.

As these matters effect the hunter or the target shooter, the amount of air space may be altered by any one of several things. A shell may be slightly dinged. A bullet may be seated deeper than usual. A shell may have dirt inside. The walls of the shell itself may be thicker or thinner than usual. The primer may be stronger or weaker than ordinary. Every one of these things registers its result infallibly when the cartridge is

fired in the rifle—the bullets go somewhere else than to the usual spot. The extreme range is cut down or increased, the bullet flies higher or lower than it should at all ranges, and of course we fail to register on that tack head.

A third feature has its effects. This is the grain size of the powder. There are just two main classes of smokeless powder formula used by makers—the nitroglycerine powders and the nitrocellulose powders. In each class, however, are several different sizes and shapes of grain. The stuff in each class is pretty much the same for all the powders in it; the difference between them is largely a difference of grain.

The makers might not admit it, but anyone who stops to think will know that there are bound to be variations in these grains. There will be small grains and large grains. They may be mixed together in the same lot, or one lot may run smaller throughout than another. Big grains burn slower than fine grains, give less pressure, and lower bullet velocities. The hunter in the field never knows what proportion of each charge he has is finer than the standard for that powder and what proportion, coarser. If the primer flash first strikes coarse grains his velocity will be lower than if it strikes fine grains.

The God of Luck has a good bit to do with the striking point of the bullet so far as this matter of the grains is concerned. If shells are loaded at home the powder can be watched and perhaps a few of the grains measured with a micrometer caliper to get an idea of what will happen. Factory ammunition performance can be foretold in advance of shooting by tossing a coin about as accurately as any other way—which means that no one can tell whether the bullets will fly normal, high or low without actually trying a few shots.

And there is still a fourth feature of powder which effects the striking point of the bullet. That is the chemical make-up of the powder itself. Back at the beginning it was mentioned how some lots of powder run strong and take less number of grains per charge, while others run weaker and take heavier charges. The reason is that in the mixing it is impossible to get the different batches the same. No man knows what a lot of powder will do till it is tried in the gun.

The powder makers are careful about this matter, *selling to individuals only such lots as conform to a certain standard*, as for instance No. 20 powder for general selling must be of lots requiring about 48 grains to

the charge in the 30-06 cartridge. To the cartridge loading companies, however, they sell the stronger and weaker lots as well, knowing that these firms will test velocities for themselves and load only what will give standard bullet speeds. That is all very well within rather wide limits, but it leaves out of consideration the effect of density of loading and some other matters, with the result that we are off that tack head from still another cause.

Nothing in the foregoing is to be taken as implying that factory ammunition or carefully and properly hand loaded ammunition is unreliable. On the contrary, it is as reliable as the nature of the powder, primer, shell and bullet will permit it to be. The point is that no powder is made so exact and so unchangeable that we can draw a bead on that tack and expect to drive it or even to lead it every time. If the rifle is good and the shooting good, the sights may be adjusted to hit the tack *with perhaps any one lot of cartridges*. Then the next lot of cartridges that come from the store may put the whole bunch of bullets in an equally small space an inch or two higher or lower than the tack, or even off to a side a little.

Dead accuracy season after season would result from the use of absolutely uniform powder, shells, primer, bullets and barrel, which is a combination that never yet has existed.

Can you then adjust your rifle and expect it to shoot into the same bullet hole—or into a squirrel without fail? "It is to laugh!" as a Polish acquaintance of mine used to say.

And the fellow who takes up a 30-30 rifle or a 38-55 season after season and claims he can shoot 'em dead with any ammunition that will fit, because his gun is right and his eye is good—how about him? RATS!

The one outstanding lesson from this study of powder is that every hunter should do what a target shooter does—test every lot of cartridges just before he starts out to use them, and adjust his sights to their particular needs. If he does not he is likely to be treated to some painfully surprising misses on easy shots.

A further precaution that can be taken is to store powder or loaded cartridges so they will be *least* subject to atmospheric influence. Powder cans should be closed as tight as possible, always, and never should be left with the lid off over night. Powder itself should be handled openly only in normally dry air. If it has dried out or become

damp, stir and mix it well, then try a few loads to see how the bullets hold up at long range. Both powder and loaded cartridges should be stored in a dry place. It is not always possible to keep them at a fairly even temperature, but they never should get very warm, and if convenient they are the better for being kept from freezing temperature.

Finally the man who wants the finest results will take steps to waterproof all cartridges he keeps for any length of time and all he takes to the field. This can usually be done best by applying shellac round the primers and bullets, though plenty of a good

lubricant usually will do the trick for cast and grooved bullets.

Anyone inclined to experiment for himself can prove the effect of moisture on powder very easily. Of the same lot of powder, put enough for ten shells where it will be exposed to very damp air. At the end of about 48 hours, load into the ten shells, and also load ten more with powder that has been kept dry. Then fire them all at 500 yards without changing the sights. When you go to look at the target take along a piece of chalk or a big black lead pencil. You will find you can draw the outline of a full-sized bear between the centers of the two groups of bullet holes.

The .22 Long Rifle Hollow Point Cartridge.

C. S. LANDIS.

IN the February 1919 issue of *Rod and Gun*, Mr. Roy Fraser requests an article on the .22 long rifle hollow point cartridge and also requests that I get busy on something in the line of an article on the .22. Without knowing it he has very kindly supplied the most difficult part of any article, its subject, and I will try to supply the remainder.

As most of our readers know, the small bore rifle has been one of my pet hobbies for many years. I have tried practically all of the small bore loads on the market and many not on the market, and believe that the .22 long rifle hollow point cartridge comes the nearest to being the best all around small bore cartridge on the market for the AVERAGE shooter. This does not mean that I consider the .22 long rifle hollow point cartridge the ideal small bore cartridge. Far from it. The velocity is 60 per cent too low and sometimes the accuracy is not great enough—and it should possess 200 per cent more energy without any greater ability to MANGLE game.

Now let us consider what qualities the ideal small bore cartridge should possess. They are:

1. Gilt edge accuracy (1 inch circle at 50 yards).
2. Highest velocity possible with low energy and finest accuracy.
3. Not over 300 ft. lbs. energy.
4. Lowest possible COST.
5. Long barrel life—easy cleaning.
6. Sold anywhere.

7. Clean killer without undue mangling.

8. Danger space beyond ranges over which small game is usually shot—as short as possible.

9. Equal adaptability to both hunting and target shooting.

I am sure that I am safe in saying that the .22 long rifle hollow point cartridge possesses all of these qualities except number 2, and some of them are slightly deficient in accuracy. This can usually be overcome by testing the various standard brands in the particular .22 calibre rifle that one is shooting. After shooting 50 shots with each make, choose the one making the smallest groups, or rather the one that groups the 80 per cent of its shots in the smallest groups.

The difference between the average of the make, making the smallest groups and the make giving the largest groups—will be about 100 per cent or just about the difference between a 1 to 1¼ inch average at 50 yards and a 2 or 2½ inch average.

So far as I know there is no way of telling which make or lot will give the smallest groups without making a test of this kind. After making such a test buy all that you can of that particular lot of cartridges that give the best average and the greatest uniformity of grouping.

As a usual thing, the bullets having the largest hole in the nose of the bullet or having the highest velocity, or both—will give the poorest accuracy and the greatest killing power—when they do hit RIGHT, and vice-

versa. So therefore, which cartridge to select after making such a test, depends upon whether it will be used for close target shooting and squirrel shooting—or for rabbits, woodchucks and larger game.

The .22 Long Rifle as a Target Cartridge.

The .22 long rifle hollow point cartridge will—if you select a good lot of course, shoot for accuracy at 50 yards with any cast bullet load on the market that has the bullet seated in the shell—that I have ever seen. I do not believe that any factory cartridge that uses a cast bullet will equal it in accuracy excepting the same cartridge (.22 long rifle) with solid bullet.

Winchester .22 Long Rifle Cartridges, Lesmok powder and hollow-point bullets. Elev. 2,90, W.G. 3.95 Stevens' rifle and telescope sight. 10 shots 50 yards prone. No sighting shots. Oct. 26, 1914, 4 p.m. C. S. Landis.

I have, shooting a single shot hunting rifle equipped with telescope sight, scored from 489 to 493 out of a possible 500 for 50 consecutive shots—on a ONE INCH bull at 50 yards, quite frequently. It will not shoot out of a 2 inch bull (after being sighted in of course) at 50 yards, often enough to worry about.

As a Game Cartridge.

A gray squirrel—sitting up—presents a 2 inch area across the shoulders that is absolutely fatal each shot up to 50 yards if the shooter can HOLD.

I have killed 16 straight gray squirrels using this cartridge of Winchester make and have killed 5 with 5 cartridges with U.M.C.'s which were less accurate than the Winchesters in MY RIFLE but had a flatter trajectory, tore a much larger hole and were better killers on the larger species of small game.

As a squirrel cartridge—it has one peculiar and very good advantage that I discovered more or less by accident in shooting—that in game such as squirrels and at ranges not over about 40 yards, that it had a peculiar explosive effect on game that was shot in the

stomach (not entrails) and that in every case of this kind that came to my notice, it absolutely paralyzed the game on the spot.

A squirrel that was paunched would simply collapse, no struggling like one shot through the head or lungs, no meat spoiled, the game was not bloodied up by its struggles and was not mangled as badly as one shot through the shoulders.

In fact, I considered that under 40 yards, the stomach shot was the cleanest shot to make on this game when using the hollow point cartridge.

So far as penetration is concerned at 40 to 60 yards—the bullet would usually stop under the hide of the far shoulder, when shot through the shoulders, of tough old grays; and in end to end shots, head to stern or the opposite, I never got a bullet clear through the carcass and what was left of the squirrel was usually of not very much use for the table.

There is no question about the fact that this cartridge lacks both velocity and energy.

For a squirrel cartridge it should strike hard enough to knock squirrels off the trees when they are hit most anywhere. This it will not do over 40 yards and not always under that, unless they are cleanly killed or very badly hit. A .25-20 or similar cartridge, with its four times greater energy, will knock them off nicely.

When one is shooting off dense trees this is an important item. Due to the high trajectory of this cartridge it is practically useless against squirrels over 50 yards, due to high and low hits and misses, due to errors in estimating the range correctly, and if there is anything more discouraging to a squirrel hunter than to have half his bag of game shot through both hams and ruined by hollow point bullets I do not know what it is unless it is no squirrels at all to shoot at.

As a woodchuck cartridge it is fine killer at short range, on shots at the butt of the ear, through the neck or the spine between the shoulders but on other shots it lacks the punch to stop them on the spot before they dive into their holes.

On all lung shots or larger game such as coon, etc., it should do well as it tears a hole the size of a quarter to a half dollar as it goes through the flesh, but it lacks the penetration so necessary for good work on such game except at very short range.

On birds, anything smaller than grouse it mangles, and for crows, hawks, etc., it has such a high trajectory as to be practically

"Pull!" "Bang!"

A Clean Break! Out in the open, under the blue sky. The trap house just ahead and your eye ready to spot the bird in its flight from the trap. A quick aim, a steady pull—and, what satisfaction to see the clay target smashed to bits as it hurtles through the air. It's the greatest sport of man or woman. Make it complete by your selection of ammunition that responds to aim and trigger pull.

Dominion Shotgun Shells

are the trap shooter's dependable ammunition—accurate, fast and true as to pattern. There is just enough difference between Dominion Canuck, Sovereign and Regal Shotgun Shells to meet each individual requirement.

Join the thousands who are shooting at the traps this year. If there isn't a gun club in your town, start one—and be sure your ammunition is always Dominion—the ammunition backed by the big "D" Trade Mark.

Canuck Shotgun Shells—

one of the Dominion brands—now hold the Canadian long run record at the traps—203 consecutive breaks.

Dominion Cartridge Co., Limited,

Montreal, Canada.

useless compared to any high power small bore cartridge that is really accurate.

The beauty of the .22 long rifle hollow point is its cheapness, fine accuracy, good killing qualities up to 50 yards and no bother about reloading and as a result the man who shoots it actually KNOWS his rifle. He shoots enough to become thoroughly accustomed to the hang, trigger pull, sighting and trajectory of his rifle. As a result he

gets to be an expert small game shot. In other words, he gets all that is to be gotten out of his rifle and that is what the average busy individual who likes to hunt, but who has other things to do beside loading rifle ammunition every evening, is looking for.

I believe it to be the very best all around cartridge for small game hunting and target shooting for the AVERAGE individual for these reasons.

Experiences With a .22 High Power.

"E. H. D."

THIS will be an account of my experiences on game with the .22 high power Savage which I have been promising you for some time. It dates back into the year 1915 when the .22 high power was the newest and most talked about gun on the market.

I live in a city situated in the heart of the best hunting grounds in Ontario and it is no uncommon sight to see deer or moose come right into the centre of the city and stare in amazement at the buildings and then walk quietly off into the woods again.

Now to get back to the topic of conversation, I owned a .30-30 Winchester carbine but never seemed to have much luck with it as I had wounded several moose and they always managed to get away and die and there is no sport in that kind of hunting and I would rather miss them than hit and lose them as they nearly always die if hit through the body so I got rid of this gun.

A friend of mine had just bought a .22 high power and then a fellow offered him a .280 Ross to take out for his trip so he advised me to take the .22 high power and try it out and I accepted his offer.

There were to be five in our party this year but as some of the boys could not get away for four or five days after the season opened my friend and I jumped on the train on the night of November first and in a couple of hours were having supper in our camp forty miles away. We had come down just for a couple of days to scout around and to see where the game was holding forth, for the coming week we would be down in force after their hides.

We did not intend to shoot a moose on this trip but if we could get a deer we would take him out for meat for camp.

We accordingly left camp at daybreak the

next morning fully confident of making a hit before we returned so I put a piece of rope in my pocket and threw the little .22 high power over my shoulder and started. I must say for the benefit of the readers that have never handled one that they are very light and a real graceful looking little gun.

We hit the trail along the river for half a mile or so and then discovered some pretty freshly made tracks where they had been around the previous day so deciding where we would be likely to find them, as we knew the country pretty well, we got into one of our fishing boats and paddled up stream about a half mile and again took to the woods heading towards some lakes about another half mile away but before reaching there we struck some fresh tracks and separated to take our chances as I am a firm believer that four eyes and ears can see and hear more than two.

I had not travelled more than ten minutes going very slowly and wide awake when I came into view of one of the lakes, where I stood still and watched around the marsh for deer. Seeing nothing, I decided to go around on the right side as my partner would be on the left.

I had not gone over fifty yards until I thought I heard something on my right and turning my head I beheld a nice young buck standing under some bushes not forty feet from me looking straight at me. He was standing broadside to me with flag up and feet spread apart for a bound into the brush. I knew that I must use caution here as I am not a good shot by any means and had a strange rifle I had never fired before.

I slipped off the safety and very slowly raised the rifle to my shoulder, then slowly lowered my head to catch the sights without

Always carry a DAYLO for hunting and trapping

Inspecting Traps, Dead Falls and Snares with a Daylo

WITH a Daylo to help, you can pick out tracks
and signs that an Indian would miss—

- Inside of hollow logs and trees.
- Under big tangles of roots or driftwood.
- Under banks covered with overhanging grass and brush
- And even down in the home holes and dens of the
fur bearers themselves.

No successful trapper should cover a trap line without
an Eveready Daylo—the light that says, “There It Is!”

a movement of the body and as quickly as he crossed my sights I fired. He only stamped his front foot, switched his tail and ears and then was still again. I had seen the dirt fly off a rotten log just under his chest so I knew that I had shot low. In a second I repeated and taking a bead back of his front shoulder I fired again and he dropped on his front knees but was up in a second and flag down he made off. I again fired and missed and I made ready for another shot but it was not necessary for he ran about thirty feet and apparently blinded ran a foul of a snag and fell. Being unable to rise he died in a second or so before I reached him. Then I dragged him to higher ground and bled him but got very little blood.

By this time my partner had come up, so we dressed him and hung him up.

My first bullet had made a clean hole through the fleshy part of his front leg just below the body but the second had gone between the ribs and expanding before reaching the heart had literally cut it to pieces. Then it entered the shoulder on the opposite side leaving a hole you could easily place your four fingers into so I came to the conclusion that she was a bear to hit but I wanted to see how she would hit moose before I would want to buy one.

We did not see a moose in the next few days although we started a couple but the brush was too thick to get a sight of them so we came back and carried the deer home and had some choice venison for supper. Then we had a good sleep that night and the next morning we took part of him back to town, leaving the rest in camp for camp meat, when we would be down again for a couple of days for our annual moose hunt.

In three days we were again having a midnight meal in our camp by the stream in preparation for the hunt the next morning.

Before daybreak we were again on our way and about a half mile from camp we ran into a pack of coyotes but it was still too dark to see or to shoot them although there was quite a pack. They split into three bunches and ran howling through the woods. Wouldn't we have given them a merry time had it been light enough for us to see and to have shot into them with five guns spitting fire.

A few hours later my partner and I were sitting on a ridge overlooking the surrounding country in search of what we could see when I heard something break a twig and an instant later a nice bull stepped into view down in a thicket about a hundred yards

below us but unfortunately was gone again in a second from our view. Right here in spite of argument my partner pulled a boneheaded play, if I may call it so, as he slid down the mountain after Mr. Moose and both were lost to my view.

I was in a bad plight as I did not know what move to make so that I could get a shot but spotting a low ridge running crosswise to where I was standing. I ran along the ridge towards the rise in the ground and stopped about three or four hundred yards from the spot where I figured was my only chance to get a shot if he came that way and then I would be very lucky if I touched him at that distance.

Presently to my surprise up popped Mr. Moose on the run and swinging his head to look for my partner and I fired and missed. Again I fired and he hunched on one leg, then changing his course, limped into a poplar grove and stopped.

I had broken his hind leg, so taking another deliberate aim I fired and he fell. He tried to rise but could not seem to manage it so I fired a few more shots but to no avail as the brush was very thick. Seeing that he could not get away I came down and walked up to about forty yards of him and he was sitting up on his haunches. I again fired just back of his shoulder but he only tried to get up. Next I took a shot at his head but still no effect. By this time my partner had arrived on the scene and with two shots he finished him.

My first shot had broken his leg just below the hock, the second had broken his back just above the kidneys and the third went into his lungs. The fourth hit just below the eye had turned downwards and broken both jaw bones. My bullets had inflicted heavy damage but had not killed.

The climax came two days later when I was all alone. I noticed fresh moose tracks going in my direction but as there was no snow I could not follow to any degree of success so, stopping on a little open patch of rock, I was looking around and listening when a twig cracked and then out steps a lordly moose not more than thirty yards yards from me and stood looking straight at me. How I prayed, for a gun his size, no man will ever know.

I looked at the gun and then at the moose so decided not to take chance. Fully five minutes we watched each other. He was the largest moose by far that I had ever seen and I have seen dozens of them at quite close range.

Let your trap gun purchase be a PARKER. Be one of the thousands of satisfied PARKER Gun users.

PARKER Guns are made by gun experts. The purchaser of a PARKER Gun receives in good substantial gun value, the benefits of experience in gun manufacturing of over 50 years.

Once you have used the PARKER, you will never be satisfied with anything but the BEST.

Eventually you will shoot the PARKER. Why not now?

Send for catalogue and free booklet about 20 bore guns.

PARKER BROS., Master Gun Makers **Meriden, Conn., U.S.A.**

New York Salesrooms, 25 Murray St.

He carried 34 points, seventeen on each horn, and must surely have had a spread of six feet if I am any judge of distance. He had a beautifully shaped head as well. I would have given one hundred dollars to have had it at the railway station but the chance of killing him, or he me, was too great as he certainly would have charged me had I not killed him with one shot in the forehead, as that was the one best shot to take.

After watching him for some time another bull stepped out broadside to me about 20 yards from the big fellow and stood watching the other fellow. I looked him over and he carried 12 points but the head was scrubby compared with the big fellow. So was the moose but he was more my size so I picked out the small of his back and decided to give him a pill and down he went with a thud. I repeated for another shot and she jammed tight failing to extract the empty shell. I took a look at the big fellow and he had ambled off about thirty feet and was again standing so I yelled at him to go when he had the notion and he trotted off much to my satisfaction.

After using my pocket knife I managed to extract the shell and reloading worked down to about 20 feet from my moose whose back I had broken. He was still very much alive but unable to rise on account of the position he had fallen in.

I then took deliberate aim for the back of his ear and fired but he only tried to free himself. I fired another shot at the same place with the same result. I was now discouraged but had to finish my job so tried it again in the same place and he stretched out. All of the three bullets went in at one place not an inch apart.

This finished my experiences with the .22 high power.

Returning to camp I returned the gun with the remark "sell her" and he did. The purchaser of her, later killed a mobse with her after firing 21 shots into him and throwing nearly the whole carcass away as a result.

I now pack around a little .30 government 1906 and what she won't kill in a hurry there is not much use in anybody else trying, so far as the gun is concerned.

Notes on the .256 Newton

"CANUCK"

SINCE writing you the last time concerning my Newton I have tried each different load a number of times and would say that the .256 Newton is as accurate if not more so than any high power rifle that I have ever used. This with factory open sights.

I have found that the cause of wild shooting that I spoke of was due to a loose takedown. When I got that front receiver screw adjusted so a fair amount of force had to be used before the magazine floor plate "to which the front receiver screw nut is pivoted" would turn to the proper position where it would snap shut then it became a different rifle altogether. I will have a band put around the barrel and forearm just ahead of the rear sight band so as to have the barrel and stock absolutely rigid.

Then there will be no chance of the takedown working loose. I am also going to make or rather have made, a folding leaf rear sight which I think will have any folding leaf sight now on the market beaten a mile.

It will be a two leaf folding sight on which

each leaf can be adjusted laterally independent of the other. These leaves to have the usual slides for vertical adjustment. One leaf to be mounted on a regular thickness of base. The other leaf on a base $\frac{1}{2}$ as thick and about one-eighth inch wide, same shape as regular base. Now in the regular base cut a slot one-eighth inch wide and $\frac{1}{2}$ the thickness of the base in which to mount small base and leaf.

One of these leaves to be adjusted for the full loads and to be a check on the peep sight. The other for reduced charges in small game shooting, to be used when there would be no time to adjust a double micrometer sight.

For the present I am going to put on a Lyman number (48) receiver sight a King folding leaf and a King one sixteenth inch gold bead front. I am of the opinion that this will make as good a combination as it is possible to secure at this time.

Since tightening up the takedown I have tried the Ideal bullet 269386 with 14 grains of du Pont number 80 and at 50 yards I averaged $1\frac{1}{2}$ inch groups. I have tried the

THE DU PONT

DU PONT CANADIAN INDUSTRIES

THE DU PONT

The Huns of Birdland

Crows are no good. They steal seed grain and dig up young crops. They rob the nests of the friendly insectivorous and game birds. They are the Huns of Birdland.

Crow shooting is good business and good sport.

The black robbers fear nothing so much as duPont loads—the powder that drives a charge that's impossible to fly through.

Have you heard about the National
Crow Shoot we have inaugurated?
And the prizes we are offering?

WILMINGTON, DEL. U.S.A.

THE DU PONT

DU PONT

THE DU PONT

regular 129 grain copper jacket soft point bullet with 38 grains weight du Pont number 18 at 50 yards and also at 100 yards and when the weather gets warmer will try this at 200 yards. This is a very nice shooting load. There is almost no recoil. It is not noisy and is very accurate.

This load is easy on the gun also, judging by the amount of metal fouling which shows on the cleaning patches when using stronger ammonia. I think this would be a fine deer cartridge. There seems to be plenty of power. Penetration is 10 inches of cedar, and there would not be such a loss of meat as the bullet has a much lower velocity and therefore does not have the terrific tearing effect of the full power load at 3000 or so f.s. velocity.

Shooting several 5 shot groups prone at 50 yards rest gave an average size group slightly less than $1\frac{1}{4}$ inches with this load. At 100 yards one group of five shots was about 3 inches. Three of these could be covered with a quarter but due to poor holding the other two shots were very poor making the group slightly more than 3 inches.

Using 47 grains of 16 at 100 yards gave 5 shot groups that also averaged 3 inches. This load seems to metal foul very badly, more so than the 53 grain load of duPont number 13 in the factory cartridges. These loads seem just as accurate as the factory loads.

This shooting was all done after the take-down had been tightened, but with open sights. I would like to try a few groups with factory cartridges but they are hard to get and cost real money here in Canada so I will have to forego the pleasure until some time in the future when I get the rifle equipped with the new sights.

Regarding the loading of the cartridges I have had no trouble with the cast bullets after I had reamed out the crimp well. I seat these bullets leaving one groove and one band out of the shells.

It was impossible to reload fired shells with the jacketed bullets using the regular shell muzzle resizing die as the brass of the shells was so thin that the resizer would not return the neck of the shell enough to hold the bullet. I got a new 25 calibre die which works very well on about 50 per cent of the shells. With the other 50 per cent the results are not so good as it takes very little pressure to seat the bullets in them, in fact they can almost be seated by hand. The tight ones I use for the high velocity load and use the others for the 38 grain load.

The cartridges so loaded can be worked through the gun all right. I have had no bullets pull out yet and the slightly loose neck does not cause any irregular shooting so far as I can see. Now that the war is over we may be able to get a better quality of shells and at least I hope so anyhow.

Just a few words in regard to the tearing effect of the .256 on game. Just before the close of the season last fall I went out for a few days hunt to try to fill my larder. Around three o'clock I had just come over a hill when I saw a big bull moose feeding on a hillside opposite me and I judged about 600 yards away. I thought this was too far for a successful kill so I started a stalk. I got along O.K. for about a hundred yards when the cover gave out and the only way was to shoot from where I was or let him go. I might say that I am fat and have no wind to speak about. I had been crawling over rocks and windfalls and did not fancy the range for off hand work. That rifle muzzle was making all kinds of curleycues too.

The first shot was a clean miss, the second the same but upon the report of the third shot I heard the impact of the bullet quite plainly. The moose made a spring to one side, then turned his stern end to me and walked into the brush and only went a little ways and stopped. On account of the thick brush I did not figure that I could hit him again so I started across the intervening valley. I got onto his tracks and within 25 yards, found where he had laid down but he had heard me coming and had gotten up and moved on. This was repeated three times in 100 yards.

When he got up the third time I got a chance and planted a bullet in his neck and that moose was dead instantly.

When dressing him we found my third bullet had hit him pretty low too far back making a paunch shot and had torn a hole in his paunch about 5 or 6 inches in diameter and made a fierce mess of things generally.

The insides were badly torn and there was two or three pails of blood inside. No bleeding outwardly, even when the throat was cut there was no blood flowed at all. All the blood was inside. Too much power here for deer.

In my hunting next fall no more of that long distance stuff for me. I'll get close enough to place the bullet in a vital spot or else let the animal go.

I don't like to see any animal suffer, least of all one of those great monarchs of the silent places.

HERCULES

Smokeless Shotgun

POWDERS

A Pointer for Sportsmen

When you buy loaded shells from your dealer you ask for the brand that you are accustomed to use—and you insist on getting it.

You should at the same time insist that these shells be loaded with

HERCULES

Smokeless Shotgun

POWDER

INFALLIBLE

It is important to you that you always shoot the same powder and that this powder is one that is *dependable* at all times and under all conditions.

Hercules Smokeless Shotgun Powder Infallible is the powder for you because it is always dependable. It always burns clean, gives high velocity with light recoil and even patterns.

Buy shells loaded with Infallible. You can get any one of the fourteen shells listed here loaded with this powder.

Rifle Cleaning.

"P. A. L."

THERE are many methods in use for cleaning rifle bores, some are good and some are bad. I believe that the most common is to pass oily rags through the bore until the last one comes out clean and then to give a final oiling. Such a method would do fairly well for rifles using lead bullets and black powder, but the results are not very good when used on rifles using metal cased bullets and smokeless powder.

There are many nitro solvents and other cleaning fluids on the market, all advertised to clean high power rifles and of course to keep them in good condition. I say that these patent cleaners will only partly clean a high power rifle barrel.

What fouls a rifle barrel? Modern smokeless powder leaves a dark colored residue. While I am not sure that it is very destructive to steel or not yet the primer residue leaves a very acid fouling that gets into the pores of the steel and is hard to combat as a destructive agent.

The metal cased bullet leaves a metal plating in the bore. The higher the velocity, the heavier the plating. This plating must first be removed to get at the primer fouling in the pores of the steel. No oil cleaner will remove this plating. (Use a brass brush—Ed.)

I have tried all of the methods described in the sporting magazines and have come down to one simple and very effective method of cleaning a high power rifle. I must give Col. Whelen credit for the most of it as it was principally taken from information written by him.

First get a good rod. I generally go to a tin smith shop and get a soft steel wire the proper size and polish it with emery cloth. I then turn a ring on one end and later, cutting it the correct length, I file good sharp notches in four sides of the other end to pull the cloth up and down the bore.

Most shooters gather up old cotton rags for cleaning cloth. I think that is poor policy as they are generally rotten and the wiper will go through them and you will have trouble in getting the patch out of the bore.

I go to the dry goods store and get a yard of the strongest flannelette. By soaking it in clean water for a while and hanging it up to dry without wringing it will absorb the cleaning fluid and fouling much more readily. When dry I cut into proper sizes and keep in a covered box away from dust.

Now go to the druggist and get a 10 oz. glass stoppered bottle and have him two thirds fill it with 8.80 ammonia. See that he gives you the good stuff and not the common household variety.

After firing one or more shots out of the rifle you proceed to clean. Wet a patch with ammonia and pass it through the bore. It will come out black. Put another one through and it will come out blue. The first patch brought out the greater part of the powder residue, the second being blue, brought out metal fouling.

Continue to put wet patches through and scrub up and down several times to each patch until the last one comes out white. Now your bore is chemically clean but generally there is still a slight residue still in the bore that plain ammonia and a cloth does not take out.

Get a tube of Colgate's Dental Cream and wet a patch with ammonia and put a piece of the cream on it about the size of a pea and rub it over the patch, pass that up and down the bore three or four times and it will come out clean. Run another ammonia cloth through to take out the cream. Now dry the bore with a number of dry patches and be sure it is perfectly dry and oil well with pure sperm oil bought from the druggist.

That bore is now chemically clean and will keep in perfect condition for months and years with an occasional oiling. The process seems long on paper but when you get used to it it is quite simple and it is the shortest cut that I know of to safety in rifle cleaning.

If you happen to have a .22 rim fire that "sweats out" for a few inches just ahead of the chamber caused by the priming from the cartridge getting into the pores of the steel, just try cleaning with ammonia.

Keep that ammonia bottle corked at all times and do not use it in a warm closed room or the fumes will be too much for you if the druggist has given you the real article. Sixty-five cents will get enough ammonia, cream, and patches for dozens of cleanings. Always hang a rifle up with the muzzle down, and never cork the bore or leave the wiper in it.

When possible hang in a dry room of even temperature. A new rifle must be watched closer than one that has been used quite a bit. An old rifle seems to get the pores of the metal filled with oil and withstands rusting much better on the outside.

The National Matches Will Be Held.

C. S. LANDIS.

ALL Canadian and American riflemen will be interested to know that the National Matches will be held this year.

The matches will be held under the direction of the U. S. Navy and will be on one of the large Navy rifle ranges which according to present plans, will be the Caldwell, N.J., range.

The Secretary of the Navy has appointed Lt. Col. William C. Harllee, as Executive Officer of these matches. Col. Harllee is so well known as a rifle enthusiast that nothing further need be said concerning the certainty that the 1919 National Matches will be a great success.

The arrangements for the matches will be made by the Navy Office of Gunnery Exercises. Capt. W. D. Leachy is director of this office. He is a member of the National Board for the Promotion of Rifle Practice.

The great and outstanding feature of this year's matches is that they will all be shot with a "real" rifle and "real" ammunition. The .30-1906 Cal. model 1903 Springfield rifle will be used in all matches. Selected cartridges manufactured at the Frankford Arsenal will be provided. For both of which American rifle men will be very, very thankful. We could stand another war—but—it is doubtful if match rifle shooting could stand another dose of last year's condemned ammunition, rifles and weather combined.

The new course of fire consists of:

Rapid fire—200 yards—10 shots kneeling from standing.

Rapid fire—200 yards—10 shots kneeling, sitting, or squatting from standing.

Slow fire—600 yards—20 shots prone.

Slow fire—1000 yards—20 shots prone.

This year the famous long range matches like the Wimbledon Cup Match, the Marine Corps Cup Match, the Leech Cup Match, and the Members Match, will again hold the spotlight for the individual rifleman. The opportunity to compete for these famous trophies when the contestant is backed up by real ammunition—including 172 and 180 grain match ammunition in some of the matches, will be a drawing card that few can resist.

Few people stop to consider how close the scores run in these matches. In the last Wimbledon Cup Match but four points, out of one hundred, separated fortieth and one hundred and twelfth places. In the

Members Match last year but three points, out of fifty,—separated first and twentieth places. In the Leech Cup Match but three points, out of one hundred and five,—separated thirty-fifth and eighty-first places. In the Marine Corps Cup Match but a single point, out of a possible two hundred,—separated seventeenth and thirty-seventh places. This last was impressed upon me very strongly, as the loss of a single point cut me eighteen places in this match. We can easily see where the quality of the ammunition cuts a wonderful figure in the standing of the competitor. Therefore, in this year's matches wherever the contestant has a chance to use a more accurate powder or a more accurate bullet, or both, he is very foolish to not avail himself of the chance. One of these matches is won or lost by ten to forty shots *and no more*. What the rifle will do in the next five thousand shots counts for nothing. To win we must have ammunition that will hit that thirty-six inch bull at one thousand yards *every shot*.

The time to prepare for the National Matches is *now*. If we are so fortunate as to be selected to shoot upon our state team we can compete in every match. If not, we can go as individuals and compete in the six or seven great individual matches—have just as good a time and do almost as much shooting but we will have to stand our own travelling expenses in so doing.

At the time that this article is written the plans for the selection of the state teams have not as yet been formulated. Very likely the state teams will all be selected as the result of elimination matches.

At any rate we can be sure that with Col. Harllee at the helm, the 1919 National Matches will be very well worth the time and attention of every rifleman in America and Canada who can possibly attend.

Not the least of the pleasures of attending these matches is the chance to meet the majority of the worst rifle cranks of America.

We can see the great baseball stars in action for fifty cents—but we cannot play ball in competition with them for fifty dollars. At a National Match we can not only watch the greatest military rifle shots in America in action but we can also compete with them—and when we win—"Oh boy, ain't it the grand and glorious feeling?"

B.S.A.

RIFLES

of Yesterday
Today and
Tomorrow

IN these days of reconstruction, reflection must reveal the benefits which the great war, despite its darkness, gave us. One of these benefits was the perfected B.S.A. rifle for sporting use and target practice.

The "yesterday" of the B.S.A. is a wonderful record of successful achievement—a record still ringing with the military triumph of which the B.S.A. was so large a part.

The "today" is largely responsible for the permanence of "yesterday's" achievement—an assurance of a stable peace.

The "tomorrow" is rich with promise of pleasures in store from the return of B.S.A. rifles and guns to the field of sport.

May the "Yesterday," "Today" and "Tomorrow" of the B.S.A. blend into a satisfaction in gun and rifle equipment that will be a new and pleasing experience for you.

Write for further information, and B.S.A. rifle booklets. Sent free on request.

**THE
BIRMINGHAM
SMALL ARMS
COMPANY
LIMITED**

Dept. 12
Birmingham
England

Plans for the National Matches include teams from every branch of the Service (U.S.), from the Military and Naval academies, National Guard, and civilian teams from every state and territory. Those in charge anticipate that the 1919 National Matches will be the largest, the best handled and the most hotly contested matches in the history of match rifle shooting.

The embargo has been removed from the purchase of pre-war Springfields and a limited number of them may now be secured from the National Rifle Association at \$26.65 each.

Springfield ammunition will also soon be available.

The National Matches for the year 1919 will be shot on the Navy Rifle Range at Caldwell, N.J., August 25th to 30th inclusive. Preceding the National Matches, the period from August 4th to 24th inclusive will be devoted to instruction practice and to the Matches of the National Rifle Association. All teams wishing to attend the National Matches should be on the grounds at Caldwell, N.J., by August 4th.

Caldwell, N.J., is twenty miles from New York City, and twelve miles from Newark. To reach there, take a through train to New

York City, then take the Tube at 33rd Street and Broadway, or any station further down town, for Newark. Trains run every few minutes. Take a trolley at Newark for Caldwell. During the Matches, buses and automobiles will take you from Caldwell to the range, a distance of four miles. Those in charge of the Matches expect that they will be able to furnish a free bus service; but, at any rate, this will not cost over twenty-five cents.

Each team attending the National Matches will consist of seventeen members (12 principals, 2 alternates, 1 team captain, 1 team coach, and 1 team quartermaster, all of which must be shooters.) Eight of the seventeen members of each team *must* be riflemen who *have not* been members of a National Match team heretofore. The National Matches are assured. They will be managed by capable riflemen. Will you insure their success by your attendance and influence?

Those of us who have attended past National Matches hope to go back this year and meet old friends. Those who are newcomers will soon make friends from all over America.

Here's hoping that we meet at the National Matches—and—that you win.

Queries and Answers

Wants a Big Game Rifle.

Editor, Guns & Ammunition, Dept.

I would like to obtain a suitable rifle to take into the Peace River country. Would the .250-3000 Savage or the .256 Newton Rifles be satisfactory?

Anton Skottam,

Terrace, Montana.

Reply.—These would both be excellent rifles provided you can get proper cleaning materials up there. If not better get a rifle that is easier to clean than these high intensity rifles. A .25 calibre high intensity rifle such as these is a mighty hard proposition to keep clean if it once gets badly rusted or pitted.

I would take several bottles of nitro solvent oil along if I were going on such a trip.

Editor.

Information on Repairs For a Belgium Browning.

Editor, Guns & Ammunition, Dept.

Would you please let me know where I could get repairs, including a barrel, for a

Browning pistol, latest model, .32 Calibre made in Belgium.

Andrew Dagg,

Onslow Corners, Quebec.

Reply.—I am afraid that only Von Hindenburg can tell you that. The Belgium gun factories are a thing of the past so far as commercial work is concerned. Possibly Schoverling Daly & Gales, or Francis Bannerman, both of New York City, N.Y. could supply parts but I doubt it.

Editor.

Wants a Pump Action .22 Long Rifle.

Editor, Guns & Ammunition, Dept.

What would be the best kind of .22 pump gun to get for shooting crows and groundhogs I would not care to pay more than about \$23.00 for it.

Woodstock, Ont.

G. S.

Reply.—I would suggest the model 1914 Savage and the model 12 Remington both using the .22 long rifle hollow point bullet cartridge. If you like a 20 inch barrel also include the model 1906 Winchester.—Editor.

THE PARSONS & PARSONS CANADIAN CO. HAMILTON, CANADA

Editor, Guns & Ammunition, Dept.

Could you tell me through your columns where I could procure a smokeless powder suitable for reloading cartridges for the .44-10 New Service Colt revolver. What load should be used?

I have always used black powder when reloading but it is too dirty when more than a few shots have been fired.

As I have received some very useful information from your Department I take the opportunity of getting some more.

W. S.

Belleville, Ont.

Reply—You can use 4.5 or 4.4 grains by weight of Hercules Bullseye or the proper charges of du Pont pistol powder number 3 or no. 80 du Pont. As to where to obtain these powders, write the sales departments of the Hercules Powder Co., Wilmington, or E. I. DuPont De Nemours & Co., Wilmington, Del., U.S.A.—Editor.

The .22 Colt automatic pistol.

Editor, Guns & Ammunition, Dept.

Having used a Colt .22 automatic pistol for a couple of years I thought some of the readers of your magazine might be interested in the shooting qualities of the automatic and might wish to try a set of sights similar to those I have fitted to the gun I am now using.

After reducing the trigger pull on the pistol to 4 lbs., and taking up some of the slack in the trigger, I removed the sights and fitted a globe rear sight with an aperture three sixteenths inch in diameter, with outside diameter one fourth inch, and one eighth inch deep. I replaced the front sight with one having a one thirty-second inch white bead and found this combination did not obstruct the view for target or game shooting like the regular open sights.

I also have an interchangeable globe front sight with aperture five thirty seconds in diameter, three-sixteenths outside diameter, and one eighth inch deep, used in connection with rear globe as referred to above. I prefer the bead front and intended sending you some targets made when using this combination as I found that I could make smaller groups than when using the globe front. Having mislaid these targets the one enclosed was made when using the two globe sights at 20 yards distance, offhand.

Last May while on a vacation in Ontario I gave the pistol a try out on ground hogs and found it very effective when using the .22

5 shots, 20 yards, shot with .22 Colt Auto.

long rifle cartridge loaded with hollow point bullets. Most of the shooting was from the prone position at distances up to 40 yards, and during my stay I killed 24 hogs, these being all head shots, as I found that the body shots would not stop them before they would hole.

The penetration of the long rifle is about two and one half inches, being the same as when shot from the regular Colt or Smith and Wesson revolvers, and should any of the readers who own a Colt automatic care to use the .22 short cartridge in the pistol as a single shot they will find it very accurate.

The .22 high power and the Marble's Game Getter.

Editor, Guns & Ammunition, Dept.

Is the .22 high power strong enough for moose and deer?

What sort of game could you recommend Marble's Game Getter for killing? At what range is it effective and could you say that it is an all around gun?

L. Addison,

Winnipeg.

Reply—I would consider the .22 high power a good deer rifle but very light for moose. I would prefer something heavier for both.

Marble's Game Getter would be better on a trap line than any other place. It certainly is not an all around gun in my estimation. It would be only suitable for shooting small game at very short range, or when nothing else was handy, for a shot at big game,

Preservo Means Protection

Campers and sportsmen who have had the experience of trying to keep comfortable in a leaky tent can best appreciate the satisfaction of those who enjoy real weather protection.

Tents that are made from PRESERVO treated canvas are waterproof against the hardest storms. No moisture will soak into the fabric to cause mildew and decay, and, best of all, it will wear at least twice as long as a tent made from plain canvas.

Many Other Uses

PRESERVO treated canvas is also used by campers and sportsmen for many articles that go to make up the complete campers outfit. Canvas duffel bags, pack saddles, ground covers, supply covers, bed-rolls, all give better protection and more economical service when treated with PRESERVO.

PRESERVO is inexpensive and easily applied. PRESERVO treated canvas and liquid PRESERVO can be obtained through almost any canvas goods dealer. If you encounter any difficulty in procuring same, write us and we will see that your needs are quickly supplied.

We have an interesting little book telling about PRESERVO treated canvas for campers and sportsmen, which will be mailed free on request.

Caring for revolvers.

Editor, Guns & Ammunition, Dept.

Your note following G. R. Hunt's article on "Caring for firearms" impressed me as being a thorough appreciation of the necessity of keeping a barrel clean and dry.

Would you be so kind as to give me a few similar tips on "Caring for revolvers." Also I might ask, what is the most serviceable revolver for a three months sojourn in the wilds? What is the safest and best (for the weapon) way of carrying such a firearm when passing through dense brush? A holster?

A. R. Mann.

Toronto.

Reply—So far as the barrel and cylinder are concerned, Hoppe's No. 9 or Marble's Nitro Solvent oil are about as good as any. My trouble was always to keep the outside of the frame from rusting from sweat from the body. This of course, mostly in hot weather. I tried a wick rope, soaked in oil, to keep the bore dry, trusting to yank it out when the gun would be needed, and had that rust fast for me once. Gun grease is most too smeary for use on a revolver that must be carried all the time and the oil doesn't stick very well. Being in a colder climate, you would have much less trouble in this regard.

Unless you expect to shoot pretty large game with it, not carrying a rifle, I would advise a .22 Colt automatic pistol as being about the nicest little weapon you could get. The .22 heavy frame Smith & Wesson revolver or the .22 Smith & Wesson single shot target pistol would also be splendid. If you will need to kill anything as large as lynx or larger a .38 Smith & Wesson special model 1895, a .38 Colt special or a 45 Colt automatic government model would all be very satisfactory. I would suggest, that if you carry a heavy rifle, the .22 would give you very much more pleasure, and would get small game very nicely if used with hollow point bullets.

I would welcome an article such as you suggest as being very timely. The shoulder holster would seem to me to be about the best for use in the brush.—Editor.

Various Inquiries.

Editor, Guns & Ammunition, Dept.

My Remington .22 plugs up whenever I shoot a "long," and I have a hard time getting it out. Can you suggest a remedy?

Should I take a .22 or a .32 along a trapping line, especially for coons?

When getting traps, would you advise the number 1 or the 1½ jump trap for muskrats?

Kenneth E. Kemp,

Forest, Ont.

Reply—Your Remington has been spoiled by shooting shorts in a long or long rifle chamber. The only remedy is a new barrel.

On a trap line I would prefer the .22 to a .32 and a .25-20 to either if for coon, where one would likely shoot occasional coons that were not in traps.

I would advise the double jaw traps, about 1½ size, for muskrats.—Editor.

Reloading the .32 Special.

Editor, Guns & Ammunition, Dept.

I wrote you once before re ammunition for a shot gun and am now inquiring for a .32 Winchester Special rifle.

I understand the .32 W. S. is a compromise rifle suitable for either high or low pressure ammunition and as I am about to buy a set of reloading tools would like a few points cleared up.

Would babbitt metal in small quantities mixed with lead for casting bullets injure the barrel when it readily stands high pressure ammunition.

What quantity would I use or if injurious what other metal, say tin or zinc, and what percentage of same would be satisfactory?

Is Marble's peep and hunting sight 1-16th inch size, a good combination for deer and also, for fine shooting.

Robert J. Scott,

Belgrave, Ont.

Reply—You could use Babbitt metal O.K. This metal seems to vary considerably in hardness depending upon who makes it, so that I would cast some bullets of an alloy of one to ten to one to fifteen, tin and lead, and then try to make an alloy from lead and babbitt metal that would appear to be of about the same degree of hardness. Babbitt metal alloys would not injure the barrel of a .32 Special to any appreciable extent.

The combination of Marble sights that you speak of would be very good indeed but for very fine target work, the front sight should be an aperture, a flat bar, or a pinhead, and one of the sights should be a windgauge sight.

Time of flight, sec.	.241	.509	.801	1.45

J. E. Henry.

Vancouver, B.C.

Reply.—Thank you very much for the information. Information of this kind is very valuable and is appreciated in this Department.

Editor.

Editor, Guns & Ammunition, Dept.

I wish to thank you for the part "Notes on revolver loads" and hereby also to thank Mr. Linkletter for so kindly and plainly answering the questions I asked through the columns of your great outdoor magazine, the *Rod and Gun*, November issue.

I am a .45 hand gun crank and since reading Mr. Linkletter's articles some month's ago, in *Rod and Gun*, I used the same load in the .45 Colt, that he used in the .44-40, and found it very satisfactory, in fact much better than the 38 grain black powder factory load.

I have the 255 grain bullet mould only and can make them as perfectly as any factory bullet.

I am now going to try the 8½ grains Kings Semi Smokeless and 5 grains Bullseye with the same 255 grain bullet.

I shoot the .45 Colt, 5½ inch barrel and manage to keep inside the 5 inch circle at 50 yards and some times a little better. Nothing fancy you see, but good enough for me.

I am sorry to see by Mr. Linkletter's article that his eyes and trigger finger are going back on him but I guess he is one of the boys who can feel satisfied with his good work of the past as he watches the onward march of youth.

By the way, did you notice Chauncey Thomas's last campfire talk in this month's *Outdoor Life*? We shall miss him.

S. Fred Smith,

Jamestown, R. I.

Reply.—In the sporting powder booklet of the Hercules Powder Co. they only recom-

mend 5 grains of Bullseye powder for use behind the 255 grain bullet in the .45 Colt revolver. If I were in your place I would be very, very careful about exceeding this amount at all. The powder companies have very exact and expensive apparatus for determining the velocities and pressures developed by their powders. When you exceed the recommended loads you take a risk that the powder company who made the powder and have tested it, are not willing for you to take.

I understand that Mr. Linkletter has re-chambered all of his fire arms which makes considerable difference. There is always the chance that some other person's scales or powder measure may measure considerably different from yours, more so than many imagine, and if you exceed the recommended load of any dense powder made by any company my advice would be go very, very slowly and ask the Ballistic Engineer of the company that made the powder for advice before you attempt any excess loads.—Editor.

A Savage Rifle For Moose and Bear?

Editor, Guns & Ammunition, Dept.

I want to buy a Savage rifle for moose and bear. Would you recommend a .303 or a .250-3000 Savage?

Please give me a little information on them.

James A. Cooper.

Montreal.

Reply.—I would advise you to purchase the .303. For deer I would select the .250-3000. I have never been in favor of recommending a small bullet with a soft nose that is shot at very high velocity for shooting moose and bear. There may be times that you will wish for a rifle that will shoot a bigger bullet than a German anti tank gun shoots and let it be said, that is "some bullet." —Editor.

Editor, Guns & Ammunition, Dept.

I wish some information on the .35 Winchester model 1895 and the .30 U.S. Army (30-40) Winchester model 1895. Which is the better for deer and moose, and which is the better target gun up to 800 yards?

Which is the better all around gun for the three things? I would like to know the point blank range of the two rifles as they are sighted and sent out from the factory.

R. Raymond,

Tusket Falls, N.S.

Reply.—For ranges under 150 yards, the .35 Winchester would be a better gun than the

we have achieved as
Rod makers."

Hardy Bros., Manufactory Alnwick, England

.30-40. Over that the flatter trajectory and better accuracy of the .30-40 would make it superior for game shooting. For target shooting the .30-40 is far better than the other at the longer ranges. The .35 Winchester has more recoil than the .30-40 which must also be considered, especially in target shooting.

You will likely find these guns sighted for about 200 yards. I would consider 125 or 150 yards as far as they better be sighted for for point blank range.

The actual point blank range of ANY rifle is the end of its barrel and no farther.

Editor.

Inquiries on the .250-3000 Savage.

Editor, Guns & Ammunition, Dept.

I have purchased and read, at your advice, Lt. Col. Whelen's book, "The American Rifle." I shall certainly read it again and no doubt then several times more. Actually that book is the cause of my bothering you some more.

I have become interested. I have begun to realize how little the average rifleman actually knows of shooting and of rifles and I hope to learn.

My last attempt to secure a .250-3000 Savage failed. I was disappointed to learn that they could not be purchased in Canada at that time. I intend to get such a rifle, bolt action, equipped with Lyman rear sight and Marble V. M. front sight.

I have the combination of Marble's Flexible rear and V.M. front on a .303 Savage at present and I find it excellent in the brush especially on moving targets. What I wish to ask you is this—Is there a Lyman peep sight made that could be attached to this bolt action .250-3000 rifle on the firing piece as Whelen suggests on page 84 of his book, and has it windage adjustment as well as elevation.

Would the firm attach and adjust properly these sights to this rifle? If not do you know a gunsmith in Canada that could be entrusted with the job?

I would also like a gun sling of the Whelen pattern. Could you suggest where I could get this?

Are Springfield rifles sold to civilians if made up as sporting rifles? Is there any way in which they could be procured?

I have chosen the .250-3000 Savage rifle for the following reasons. I have it on good authority, even Whelen, that it is an excellent deer rifle. Secondly, the bullet is not too

large for use on smaller game with a reduced load. Am I right? During the summer months I get considerable exercise in destroying wood-chucks or groundhogs as they are called here, for they are a pest in this neighborhood.

Hitherto I have used a .22 Savage repeater for them, but now I intend to use a reduced load with the .250. I shall certainly buy reloading tools and reload reduced loads as you suggested in your letter to me.

I enjoyed your article in the February Rod & Gun entitled "Common sense in purchasing firearms" yet I will disregard your advice by buying a .250-3000 Savage. I noticed particularly your remarks about the two men who firmly believed that they had killed deer time and again up to a quarter of a mile? One often meets that kind of expert riflemen. Last week I heard of one who shot deer from "One mountain to another." Well PERHAPS, and as you say, OCCASIONALLY and NOT in this country.

I feel safe in saying that most deer in these parts are shot at distances from 50 to 100 yards and VERY FEW over 200, to be generous. I find that many men have a very poor faculty for judging distance, or else a very elastic imagination.

Personally, I have never seen a deer in this country at greater distance than what I would call 200 yards and that was a generous estimate of the distance. Perhaps 150 to be exact, but I did not take the trouble to measure. The deer got away anyhow.

May I venture another question? Why is the Savage .250-3000 not a long range rifle. I know that it is not, neither is the .22 high power, for I have seen rotten shooting by the latter at 200 yards so that I lost all respect for the gun.

To a novice it would seem a bullet like the .250 with such a velocity and pressure behind it, ought to do good work at long range. For instance, the .30-1906 U.S. has less velocity less breech pressure, higher trajectory etc., yet is a long range cartridge. Would you explain to me wherein the cause of the difference lies?

What is the address of the firm making Lyman sights?

C. F. Christiansen,

Denbigh, Ont.

Reply—Lyman Gun Sight Corp. Middlefield, Conn., U.S.A.

The reason that the .250 and .22 high

'Lunge and Bass

Superlatively fine 'lunge and bass fishing can be had at a large number of points in Ontario along the line of the Canadian Pacific Railway. Season opens June 16th. Lake trout, pickerel and pike are also plentifully distributed.

Point au Baril and other premier fishing grounds in the Georgian Bay district, French River and the Lake Nipissing waterways, Trout Lake, Lake Penache, the Kawartha Lakes, and Trent River are amongst the attractive localities conveniently and quickly reached by the Canadian Pacific.

A. O. Seymour, General Tourist Agent, C. P. R., Montreal, will gladly give you further particulars.

power are not long range guns is that their bullets are too short. If the .25 had a bullet of about 125 grains and the .22 of about 90 or 100 they would shoot right along with the Springfield cartridge in the same kind of a rifle.

The Savage lever action is not adapted to shooting a 125 grain bullet at 3000 f.s. but there is no reason why the bolt action, when it appears, should not be, provided of course the twist was correct for the heavy bullet, but 2800 f.s. would probably make a better proportioned cartridge so far as accuracy was concerned. It is altogether possible to overdo this velocity craze.

You cannot purchase a Springfield from the United States Government and can only get one in either military form or altered to sporting model from some private individual who owns one.

Most likely the Savage Arms Corp. could furnish a sling, but not the Whelen model, and also the Lyman sight for on the bolt, when they get to making this proposed rifle. I believe that these sights that are mounted on the cocking piece are without windage adjustment. Why not get a receiver sight put on, as I think you could get the Springfield receiver sight put on some way or other, possibly not according to Hoyle but you could likely get it put on some place? Just where would make little difference as long as the front sight was of a height to suit it.

Editor.

The .35 Remington Auto and Slide Action Rifles.

Editor, Guns & Ammunition, Dept.

Could you give me your opinion of the Remington slide action or pump and the Remington auto loading as to reliability from jamming, accuracy and keeping clean?

I note that they both use the same cartridges. Could you give me your opinion as to the relative muzzle velocities and striking energies when used in the two types of rifles?

I would suppose that they would be somewhat less in the auto than in the pump. Also what is the "striking energy" at the butt of the .35 auto loading, (recoil in foot pounds).

I am accustomed to shooting the .303 British 1895 Winchester so I suppose that I would not find it uncomfortable.

J. S. McVittie,

Sudbury, Ont.

Reply—I believe that you will get splendid satisfaction from either type of rifle. Of the two I would consider the auto the MORE

reliable in action and the pump the more accurate. I do not believe that you could tell any difference in velocity or energy.

The recoil should not be objectionable to anyone accustomed to the .303 British Winchester.—Editor.

Various Queries.

Editor, Guns & Ammunition, Dept.

I would like to ask your opinion on the following—

What kind of rifle and calibre would be the most suitable for target shooting and for small game as woodchucks, squirrels and particularly the sweet melodious cat?

Is the auto loading Remington a good rifle for target shooting?

For extensive shooting with the rifle you recommend, would it pay to reload my ammunition?

What sights would you advise equipping that rifle with? Is the Lyman tang peep a good sight to equip such a rifle with?

Is the .38 Special Smith & Wesson, 6 inch barrel, which Ashley Haines says is the all around revolver, a good gun for target work? Also for light hunting in the woods? How would this revolver compare with the .38 Colt's Officers model?

I remember reading an article of yours on holsters for revolvers principally for a .22 Smith & Wesson heavy frame. Would you please give me the name and address of the manufacturers of it. If I remember rightly, the address was Cheyenne.

G. N.

Brantford, Ont.

Reply—I would suggest the model 1892 Winchester .25-20 calibre or the .22 long rifle Remington model 12, the Savage model 1914 or the Marlin model 1897.

Not as good as their model 12.22 long rifle calibre. The .22 special cartridge is not quite as accurate and costs more.

Yes, for the .25-20.

Lyman 2A and 5B. or Marble peep rear and bead front. The Lyman tang peep is as good as any sight made, when it is the double micrometer style.

There is no better revolver for your purpose than this .38 special Smith & Wesson. The holster article was evidently written by Mr. Haines.—Editor.

the Savage, Winchester, Remington, Marlin, Newton and Mauser?

Would a .303 Savage be best or would some other make be better? At what range would each of the rifles you selected kill a moose or a grizzly?

Is there any law to prevent a boy over 16 years of age carrying a high power rifle?

John H. Springer,

Woodstock, R.D.

Reply—For a young man of 16 to 20 I do not think it would be wise to choose a weapon of heavier weight or recoil than such arms as the .303 or .250 Savage, the .32 or .30-30 Winchester or Marlin, the .30 or 32 Remington rimless. Such rifles or a .256 Newton or 7MM Mauser would be amply powerful if you can hit what you shoot at.

The .303 Savage would be hard to beat for your purpose.

Each of the rifles mentioned would kill any big game in Canada considerably farther than you could hit it, provided the bullet struck in a vital spot. Some men would kill more game at 300 yards, provided they could see it, than others could at 50 with any rifles.

I do not know of any law of this kind. Consult your local authorities.

Editor.

Bolt Actions compared.

Editor, Guns & Ammunition, Dept.

Will you please describe how the bolt works when loading a 7MM, 8MM or 11MM, Mauser rifle or carbine compared with a Ross rifle which is rapid loading.

Thomas Dean,

Wallaceburg, Ont.

Reply—The Mausers all work by turning up the bolt and pulling it back, then pushing it forward and then down. The Ross is pulled back, then pushed forward. The Ross would be slightly faster in action but it has more recoil than either the 7MM or 8MM Mausers and this would almost equalize matters in actual shooting. Bolt actions are plenty fast enough for anyone who will practice working the action of a bolt action enough to get onto the matter. Speed of aimed fire and the greatest possible speed at which a rifle may be fired are two entirely different things. The first is practical, the second is nice to think about, and makes good advertising, but is of really very small account to the hunter.

Editor.

Information on the .22 high power Savage.

Editor, Guns & Ammunition, Dept.

I am greatly interested in your magazine. I would like you to give me some information on the .22 Savage high power rifle. Is it strong enough for moose, deer and bear, and what about the .35 Winchester for same?

Malcolm Walker,

L'Orignal, Ont.

Reply—I would consider the .22 high power very light for moose and bear shooting. If you want a Savage choose a .303, or if you demand a high velocity, small bore weapon, the .250.

The .35 calibre model 1895 Winchester is a very effective weapon for this purpose. It is also heavier to carry than the light Savages.

If you mean the .35 Winchester automatic I do not think very much of it for a moose and bear rifle.

Editor.

A letter from a rifleman.

Editor, Guns & Ammunition, Dept.

What brand of smokeless powders would you use in the following guns; .38 Special target and the new .455 of the same make? I have the Ideal tools for each. (Ans. Du-Pont pistol powder No. 3 or Bullseye.)

I have had and still have a number of rifles both ancient and modern, of the latter I might mention .280 Ross, 7MM and 8MM Mauser, .303 English rifle. I also have the well known squirrel rifles of fifty years ago which still shoot accurately. I also have the .57 Enfield and the Springfield and also the old repeating Spencer carbine.

I also have a pair of Remington cap and ball revolvers and a pair of .36 Navy Colts which will give a good account of themselves if properly held.

In regards to scatter guns I have owned quite a number of nearly every description from the old tower flint lock to the 1912 Winchester.

There is also in the collection an old double barreled percussion cap shot gun made by Mortimer, the first one I ever ran across, but perhaps you are familiar with them. It has a 31½ inch stub twist barrels, patent breech, 20 gauge, straight sighting rib, front action lock, neatly engraved and beautiful springs.

The stock is birdseye maple done in old London oil finish and almost black with age. I use it with 2 drams powder, ½ oz. BB shot for shooting rats from a canoe. It is certain death at ranges up to about 30 yards and does not mutilate the game.

About Your Own Vigor Sent Free To Men

MR. READER:

Here is something I have to offer you absolutely for nothing—a little private book of special information about the legitimate uses and unnatural abuses of manly vigor; about the preservation of manly strength and its possible self-restoration; an illustrated, pocket compendium of 8,000 words, 72 pages and 30 half-tone photographs, reproductions—which I am very pleased to send by mail, absolutely free of charge, in a plain, sealed envelope, to any man, young or elderly, single or married, who writes for it.

Over a million of these books have been thus sent to applicants all over the world since my free offer first appeared. Publishers are charging as much as \$2 for books on sex subjects, while my book is free. Therefore, reader, if you would like a great fund of inside information relating directly to the subject of manly vigor, all put in perfectly plain, easy-to-read language, with many hints that you can surely apply to your own self no matter how strong you may be, or how nervous or run-down you may be—if you want to know the facts about this particular subject, given to you without a single scare, then fill in the coupon below, send to me and receive my book, sealed, by return mail. In one part of this little publication I describe a mechanical invention of my own, which I call the SANDEN Vitalizer, something you wear at night as an aid to the restoration of lost or waning strength; but you are not expected to get one of these appliances unless you decide for yourself that you want one. The book is complete, and there is absolutely nothing you are required to buy or pay, either now or in the future. Therefore, please send your name and address to-day. SANDEN, Author.

MANHOOD! The quality which rules the world to-day. My friend, there never was a time in the history of the human race when real, sturdy manhood, manly vigor and manly courage counted for as much as they do now, this very minute. No matter what your years, whether you are 20 or 60, you must be either entirely in the race or entirely out of it. It is invariably the fellow who proves up the strongest in this human strength that forges to the front, while weaklings stand aside; it is he also who is in most demand and most sought after by women and men in his community, simply because he radiates that marvellous magnetic influence which only an abundant vigor and rugged manly health can radiate. I believe any man can hope to completely develop or restore this same vigor of manly strength, no matter what his past follies may have been, provided he is willing to REALLY MAKE THE EFFORT; and provided, of course, he is not weighed down by extreme old age or is not incurably diseased. To my mind, the road of the one who wants more vigor is perfectly plain,

Manhood Wins in All Walks of Life

but it is a road that any man MUST travel if he attains the highest ideals in respect to his own manhood. See information in my free book.

As to the SANDEN Vitalizer, previously mentioned, will say it is a little mechanical appliance, weighing but a few ounces, which you wear at night. This Vitalizer generates and sends forth a certain soft, penetrating force which I call Vitality. It apparently drives this Vitality into your nerves, blood, muscles and organs as you sleep. It is quieting to the nervous system—or, at least, so users say. Men write that it takes pain out of the back and restores vitality in 90 days. Remember the general information of the free book is independent of this Vitalizer, and you are not expected to get one of these little appliances unless you want to. You can write me later as to that if you so desire. With special attachments, my Vitalizer is used by women as well as men for rheumatism, kidney, liver, stomach, bladder disorders, etc. If you live in or near this city I should be most pleased to have you call in person at my office, where you may see and test the Vitalizer free of charge. Satisfaction guaranteed in every case. Or if inconvenient to call, do not fail to write for the free booklet.

TO GET FREE BOOK PLEASE USE COUPON

If you live too far to call, or if you cannot call, please fill in the coupon below and send it. You will receive free, sealed, by return mail, our 72-page illustrated book, containing 8,000 words, a complete compendium of useful information for men, young or elderly, single or married, who want the truth about the subject of vital strength, its preservation, its possible self-restoration and its legitimate uses and wanton abuses. You get it all free.

R. G. SANDEN CO., 140 Yonge St., Toronto Ont.,

Dear Sirs—Please forward me your Book, as advertised, free, sealed.

Name

Address

The Winchester 1912 Model.

Thirty inch barrel with pistol grip,
Neatly checkered so the hand can't slip,
Rubber recoil pad at the heel

The heaviest loads you scarcely feel.
Raised rib which aids the eye to bring
Down your game either on foot or wing.

The gauge is twelve balls to the pound
Which is the best, so experts have found
Winchester make of the hammerless type
Large enough for geese, A No. one for snipe,
An ideal gun for all sorts of game
'Tis all a hunter might wish to claim.

A repeating gun that shoots six times
With action smooth as Byron's rhymes,
Its perfect lines are the graceful kind,
That Mortimer sought in vain to find

A hundred years ago, when he
Made guns for the English nobility.

F. E. McMullen,

Cayuga.

Wants a big game rifle.

Editor, Guns & Ammunition, Dept.

As I am still preparing for college I have never had time to go on a hunt but having owned different makes of .22's for several years, and being greatly interested in shooting, my father decided to give me a larger calibered rifle for a present.

Not being very certain what game I will have the opportunity of hunting, I think the best way to state the requirements is "A gun for deer with a possibility of larger game."

I have had in mind a model 1895 Winchester, chambered for the .30 government 1906 shell, with a Winchester telescope sight looming in the distant future. I have heard that a scope is inaccurate except on a solid frame rifle but on the other hand I would prefer a rifle which can be cleaned from the breech, and with a clear view of the bore at that time, if possible.

I do not know if the model 95; solid frame, has these facilities.

Is there any possibility of the manufacture of ammunition being reduced to standard calibres or of the surplus of military ammunition being placed on the market, owing to peace? This would make it advisable to buy an arm handling the .303 British or .30-1906 cartridge.

Gordon R. McGregor.

Montreal, P.Q.

Reply—For your purpose, I believe it would be wise to purchase a rifle of light recoil like the .32 Special Winchester, .250 or .303 Savage, or the .32 or .30 Remington rimless.

These rifles are all very good big game rifles, are light enough for a young man to carry easily, handle fast and none of them have excessive recoil.

The model 1895 Winchester would be preferable for killing power or long range shooting but at your age and with your amount of experience in high power rifle shooting I believe that you would be better satisfied with a lighter weapon.

Personally, I would prefer a solid frame rifle, either with or without a scope. If I had a takedown I would seldom take it apart.

Just what per cent. or whether any of the war cartridges would be placed on the market is merely guesswork. If they are, then a .303 or .30 1906 would be the calibre to choose, so far as cheap shooting was concerned, but some of this war time ammunition is not quite all that it might be and is loaded with full metal cased bullets.

Editor.

Making up a special .25 calibre rifle.

Editor, Guns & Ammunition, Dept.

I have a .25-20 Winchester repeating rifle with a nickel steel barrel 24 inches in length. I have been reloading my shells using the regular 86 grain soft point bullet and 8 grains weight of Schuetzen powder. It is a very satisfactory cartridge for small game and is very accurate up to 75 yards, which is the farthest I have shot it as yet, however. It is not a suitable cartridge for deer by any means as I found out last fall.

Last week I was reading an old issue of *Rod and Gun* and saw an article written by Lieut. Whelen, where he said he had a rifle with a nickel steel barrel 27 inches long. The rifle was originally-chambered for the .25-20 cartridge but Lieut. Whelen had it re-chambered for the .25-35 commercial shell, and with the 86 grain soft point jacketed bullet and 22 grains of DuPont number 20 powder he said the velocity was about 2200 f.s. and would average 1.77 inch groups at 100 yards.

Well, that is some gun and I think the same load in my rifle would give as accurate results. But, what I think and what you know are two different things and that is why I am writing you.

If I sent my rifle to Mr. Niedner and had it rechambered for the .25-35 shell do you think I would get as good results as Lieut. Whelen got. My rifle weighs 7 pounds and the twist is one turn in 14 inches, so that I don't think that there would be any danger of stripping up to 2200 or 2300 F.S. For small

EVINRUDE

Detachable Motor for Watercraft

With an Evinrude you can go quickly, without rowing, to the holes where big catches are almost sure. Distance makes no difference to an Evinrude owner.

Variable speed, suitable for trolling. Swift, smooth, flexible power for canoe, rowboat and other craft.

Built-in flywheel type magneto. Automatic reverse. Maxim silencer and tilt-up arrangement if desired. Our special method of balancing practically eliminates vibration.

Nearly 100,000 Evinrudes have already been sold.

The Evinrude is used by 25 governments.

game I would use the 87 grain full metal patch .250-3000 bullet, so if this is possible I think that I will have some gun, because, the 87 grain full metal patch bullet at 2300 F.S. would be a more deadly cartridge than the .25-35, would it not?

Lenoxville, Que.

Dr. H. V. Hight.

Reply-Unfortunately the receiver of the model 1892 rifle is not long enough for the

25.-35 shell. Therefore you could not remodel this rifle to handle that shell. Lieut. (now LT. COL.) Whelen's rifle was a single shot Winchester with a number three barrel, quite different from the weapon that you possess.

You could very likely have Mr. Niedner make you a similar rifle or fit a barrel with correct twist to a model 1891, .25-35 Winchester action.

Editor.

Matters Pertaining to Conservation

Should the Use of Firearms Be Regulated for the Protection of Game?

T. J. C.

I would suggest that no persons be allowed to carry a fire-arm of any description other than a revolver of a calibre heavy enough to be of protective use (for which the law provides that a permit to carry such must be obtained) in the woods during the close season. Licensed trappers and legal residents of those rural districts who do not kill game only when needed, and to whom a rifle or shot gun is a necessity, for the protection of property against marauding animals, hawks and owls that prey on domestic fowl the year round in backwoods settlements, could be excepted. The trapper and settler make it their business to destroy at every opportunity these pests.

Also that during the big game season no person be allowed to carry a rifle of a smaller calibre than a 30.30. My reasons for this being that a lighter weight bullet does not do sufficient execution to prevent the animal getting away after being hit, which they do in almost every instance and cannot be found, and eventually die from the wounds. To make more clear I will give one of many instances that have come to my notice at different times while hunting.

In following an old tote road one day I met a Finlander carrying a 25-20. We stopped for a chat and he told me that he had come upon a large moose back about a mile or so. It was standing broadside on, so he took a shot at it, hitting it somewhere in the left front leg or shoulder, for it trotted off limping. He claimed to have followed it for some

distance in an attempt to get another shot at it, but lost track of it altogether in a swamp. Two days later I was hunting in that vicinity and in passing through a small thick swamp I almost fell over the carcass of a large bull-moose with a fine set of horns. I was curious to know what caused its death, so I looked him over and found the left fore-leg at the shoulder swollen to three times its normal size. Taking my belt axe I cut it open and found part of the bone to be splintered at the back with a small metal-cased lead bullet wedged in the splintered part.

Now this seemingly was the moose the Finlander had told me about shooting just two days before. I judged it to weigh about eight hundred pounds and it had a fine set of eleven point antlers with a forty-seven inch spread. It was an all round fine moose and it seemed a shame to see it go to waste. I maintain that if this man had had a rifle of a 30.30 calibre or heavier, it would have shattered the bone and otherwise penetrated to a vital spot and prevented the animal from going any distance before dropping. As it was the small bullet just penetrated to the bone, splintering it and causing infection which caused its death.

In one small swamp grown thick with small evergreens and muskeg moss, as we call it, we found the remains of five deer and two moose. Bullet wounds, as shattered portions of bone showed, had caused the death of three of the deer and one of the moose. The others were possibly victims of the wolves.

Your Lesson in Preparedness

SAVAGE

Automatic Pistol

THE war has taught us a lesson—as a nation. But—have you applied it to yourself?

Or, having escaped nationally from the menace that threatened to overwhelm us, are you, personally, individually, going to shut your eyes to the possibility of danger?

In the moment of peril, what will protect you—your wife—your daughter?

You are going to do your duty by getting a SAVAGE Automatic Pistol, so that you can live peacefully and lawfully and safely, protected by ten-shot, lightning-quick SAVAGE insurance. It's ready at your dealer's now.

I do not mean to say that the small calibre rifle is the cause of all this waste, but that it is the cause of a large part of it that could be avoided by the use of a larger calibre gun. Some is caused by parties hunting small game with shot guns who happen on a deer or moose and cannot resist the temptation to shoot. The result is that the animal receives a charge of bird shot that has about the same effect at the time that a charge of salt would have, and if it does not hit a fatal spot and cause death the animal will in all probability die from infection. Anyone that cares no more for the preservation of big game than to do a trick like this has no business to have a gun. Anyone who carries a shot gun in hunting big game should not be allowed to use anything but buck shot or slugs.

There is, as we all know, a large percentage of big game, wounded by large calibre rifles get away on the best of hunters. If they are flesh wounds and bleed well the animal recovers, if not they die. A certain game warden in his annual report to the Government once recommended that the use of rifles for hunting small game be made unlawful. This measure, as a protection to game is useless and also unfair to those who use a rifle. It stands to reason that a partridge or rabbit has a far better chance to get away from a man with a rifle than a man using a shot

gun, and if you hit small game of any kind you have it, where if you were using a shot gun you would find that a partridge or rabbit can sometimes carry away a lot of shot. I have seen more get away wounded from the shot gun than I ever have from the rifle, and I have nearly always used a rifle for everything but ducks. Then again shooting a partridge with a rifle affords one more pleasure, for it requires skill to take the head off a bird with a bullet.

There are a large number of foreigners in this part of the country, (Soo district) carrying guns at all seasons of the year, who care nothing for the protection of game and whose only ambition seems to be to slaughter everything in sight. These men mostly work in lumber camps. It is hard for a game warden to catch them with a gun for the news of his presence in that vicinity travels mysteriously and fast, so that when he arrives at a camp there is not a fire-arm of any description to be found about the place. It is almost impossible to deal with this class of game hog as he should be dealt with.

Note—A solution of the game slaughter question, that will be satisfactory to all hunters, is hard to arrive at but the above writer has suggested a few commendable reforms. Contributions on the momentous question are welcomed by *Rod and Gun*.—Editor.

The War and Game

JOHN B. BURNHAM

President, American Game Protective Association

An Address Delivered at the National Conference on the Conservation of Wild Life, held in Ottawa, on February 18th and 19th

THE total death casualties of the war have been estimated by U. S. Secretary of War Baker as 9,000,000 men. The total population of the world is, I believe, something over a billion and a quarter souls, so that the world lost something like seven per cent. of its population. But reproduction was going on all the time, and the world has more people to-day than when the war began.

Audubon once estimated that a single flock of passenger pigeons which he saw contained more birds than the total population of the world, yet only a few decades later there were no passenger pigeons. The race had been annihilated.

The comparison is interesting, for it illustrates the fact that the human being is the most hardy game animal of all. The greatest war of history not only failed to annihilate, but also failed to stop man's increase. Also it must be observed that while humanity is increasing, game is decreasing. The ratio between man and the game he hunts is constantly assuming a more unfavourable percentage as regards the game. And the war itself, paradoxical though it may be, has, in many places and over large areas, accentuated the disparity.

Almost everywhere except in North America the food shortage has caused appalling

DEPARTMENT Rod and Gun in Canada, Woodstock, Ont.

inroads on the game supply. In England, the Honorary Secretary of the English Game Guild tells me it will take at least twenty years to get game back to anything like normal abundance. The great increase in vermin, with the game keepers off at the war, is partly responsible for this. In Russia, many of the finest preserves have been ruined,

JOHN B. BURNHAM

President, American Game Protective and Propagation Association

and game nowhere exists in its former supply. In France, the poison gases have completed the work of destruction. The Mexican bandits in their mountain retreats have converted magnificent game sections into unproductive wastes.

Carl Akeley says that the war has taken a toll of from half to two-thirds of African game in the sections where there has been fighting. Much of this game, he says, was wantonly slaughtered by the Boers for rifle practice. Aside from the northern portion of North America, the picture is one of nearly universal gloom, but here, I am glad to say, conditions are much brighter.

Both Canada and the United States have wonderful food supplies, and what is more important still, an exalted brand of wisdom

with regard to their natural resources. In both nations, the full meaning of the value of the conservation of wild life is at least recognized. This was never more cleverly demonstrated than by the passage of the treaty for the protection of migratory birds which to-day unites our two countries in brotherly bond, and which was ratified by your country during the darkest hours of the war.

Neither country for a moment lost its good sense. In the face of the clamour for cheap food in the form of marketed game, efficient protective laws were in no way relaxed. Both countries knew that if the demand were granted it would mean the annihilation of the game without any appreciable benefit, for the price of food would not have been lowered by any fraction of the medium of exchange. To-day both countries have more game than when the war began—game which is of far greater value from the standpoint of making by the taking, men and soldiers, self-reliant and healthy individuals, than it can ever be for food alone.

I have seen it stated of that force of troops which Canada sent at the start of the war that seventy-five per cent. were sportsmen. After the proof these men made of splendid valour and efficiency, no further argument is needed in support of game protection. If such men are bred and vitalized by any sport, then it is sacrilege to endanger that sport. Thank God the officials who have been responsible for the preservation of the game have been true to their trust.

Just one word of caution here, which must be taken at its relative value to the whole subject. The tendency to-day is toward too much restrictive law. We must not let the tail wag the dog. Conservation of game is right, but the conservation of sport is righteous.

Next to the advance of civilization, the chief factor that has reduced our game is the market hunter. Almost everywhere we have put an end to the commercialism of game, with the result that game is on the increase. The low water mark in many places has been passed. We have the laws and the machinery for putting them into effect. From my viewpoint, we now need better enforcement of existing laws rather than additional restrictions, which are only exasperation to good sportsmen. Where the law is not thoroughly enforced, you and I know that such restrictions penalize the best class only and that the others do as they please. Laws, as a general

"The Handiest Tool a Sportsman Ever Carried"

MARBLE'S SAFETY AXE

If you go camping, fishing, hunting or trapping, or travel much in the woods you ought to have a Marble Safety Axe. Without experience you cannot realize what a handy, valuable tool it is. The axe is practical, perfectly balanced, tough and keen—capable of withstanding the severest usage, yet can easily be carried in pocket or belt. It serves all the purposes of axe, hatchet and hammer. A perfect axe for setting a tent, blazing a trail, or cutting gambrel sticks or a pole for carrying a big buck. A stream can be bridged—a raft easily constructed. With it the fisherman can quickly release his hook from a snag. Caught far from camp at nightfall, the hunter can quickly provide himself with firewood and a bed of boughs. Several men have informed us of how the Safety-Axe saved their lives on similar occasions.

Marble Safety Axes are quality tools. They are but 11 or 12 inches long and weigh only 16 to 27 oz. Nickel plated spring hinged guard is lined with lead and folds into handle. Blade of tool steel, carefully tempered and sharpened. Metal handles are drop-forged and will never break. Side plates are of rubber. Wooden handles are of selected hickory and have nickel plated steel guard and lining—for groove in handle.

PRICE With Wood Handle \$1.65. With Steel Handle \$2.75 and \$4.40

For sale by dealers everywhere. Orders filled direct where we have no dealer. Write for catalog showing entire line.

MARBLE'S NEW TROUT KNIFE

Designed expressly for dressing speckled trout and other fish. Forged from finest cutlery steel. Handle is $\frac{1}{2}$ -in. thick and terminates in a 1-in. ring through which the little finger is inserted about half its length—remaining fingers and thumb are placed just back of the blade against curve of shank. Always open. Easily cleaned. Total length, 5 $\frac{3}{4}$ inches. Weight, including metal bound sheath, 1 oz. Price, 55c

MARBLE'S FOLDING FISH KNIFE

A handy knife for hunting and fishing use. Cuts, rips, scales. Blade folds into handle. Locks when open. Easily carried in pocket. Price, 4-inch blade, \$1.40.

MARBLE'S WOODCRAFT KNIFE

Combines the good features of all hunting knives. Adapted for sticking, skinning, cleaning, slicing. Biggest value on market. Blade, 11 $\frac{1}{2}$ in.; laminated leather handle, 3 $\frac{3}{4}$ in.; aluminum tip; weight 5 oz. (Sheath included) \$1.65.

READY FOR WORK
Metal Guard folds into
Handle when Axe is in use

rule, should not be enacted too far in advance of public sentiment.

Close seasons are worse than useless unless they are enforced, and the vermin kept down. I say they are worse than useless, because they do not increase the game, while they do increase lawlessness and disregard for other laws. In the United States, antelope and mountain sheep have been exterminated under long closed seasons. In this instance, it is true there should have been closed seasons, but they should have been enforced. It would be much better to lose the game without law than to lose both the game and respect for law at the same time.

At the recent dinner of the Canadian Camp in New York, a Canadian member of Parliament told how generally game laws were violated in his province. North of this city, in time pasts, I have seen beaver skins openly trafficked in, while the beaver were nominally protected by a close season. There were plenty of beaver and the people could not see the necessity for protecting them. At Fort Yukon, they fed dogs on white flour last winter with moose in sight every day, but on the headwaters of the White River, men were taking dogs to board and feeding them mountain sheep. All you gentlemen, whether from Canada or the United States, could multiply such instances.

Don't spring your law, no matter how good, until you are prepared to put teeth in it. Better err on the side of too great liberality than err in the other way. Educate the public to see the necessity for protective legislation. The great mass of testimony proves that paper laws play into the hands of the Huns of sport. Let us, by all means, have fewer restrictions and better law enforcement.

In the United States, we feel that the situation as regards the future of the wild fowl

supply for the present and future is now amply safeguarded by the Migratory Bird Treaty Act. Though of not nearly so great importance as our treaty with Canada, we hope within a reasonable time to secure similar relations with Mexico. The wild fowl supply has certainly increased tremendously in the last few years, and I say this, despite the fact that on our side of the line the shooting season just past was, in many parts of our country, the poorest we have had in forty years. This was due, of course, to the unusual mildness of the weather.

In general, the States are looking much more closely than ever before to maintaining their supplies of localized game. A business-like feature towards this end which is receiving much attention with us is the game census. In many states, the new hunting licenses require, in addition to the usual facts, a report of all game and fur-bearing animals and vermin taken during the previous year. The killing of vermin is encouraged. This is being supplemented by estimates of the game animals and game birds at large in the covers. It is a business proposition, this inventorying of resources, and it furnishes a business basis for new regulations. I look to see the system greatly perfected in the United States and Canada during the next few years.

Then, too, we are doing a tremendous work in the United States in propagating game, chiefly deer and pheasants, to stock depleted sections. The States in the aggregate are spending a good many hundreds of thousands of dollars in this way for the benefit of the sportsmen. Looking to the day when wild fur-bearing animals will be less numerous than at present, the United States Government, under the direction of Dr. Nelson's department, has established an experimental fur farm in Northern New York.

Alpine Club of Canada

The Director's Annual Address

MY annual address for our thirteenth Anniversary is a very pleasant duty as compared with that of last year. Then, all was at its blackest and the whole world waited with breathless tension for the mighty clash of numberless armed forces that was to decide the final result of years of terrible fighting such as had never been before. Even while I wrote that awful last struggle had begun. Deep down in all our

minds was the thought: "Can it be possible that the unheard of atrocities of the enemy hordes in Belgium and France and in other lands will go unpunished?" "If that be so what have we to hold to that is worth living for."

Long before the 11th of November, 1918, the final result was settled beyond dispute, but, on that never to be forgotten morning the electric spark circled the globe and carried

H. H. MELANSON
Passenger Traffic Manager
TORONTO, ONT.

A detailed black and white illustration of a man fishing in a stream. The man is shown from the waist up, wearing a light-colored, short-sleeved button-down shirt and dark trousers with a belt. He is holding a fishing rod in his right hand, which is raised high, and a large trout in his left hand. The trout is being held up, showing its size. The background shows a forested area with trees and a stream. The overall style is that of a vintage travel advertisement.

the glorious news to every spot upon the earth's surface reached by the wires.

An Armistice had been signed at 8 o'clock that morning. Though a military preliminary, all knew that it meant the end of the war, and that all our dear ones who were still fighting were saved to us.

It is said that on the battle fields when the news was received, it was received with utter unrealisation. But one phase of the only half believed news was grasped. "We do not have to fight"—and there and then men sank in their tracks and slept—slept as never before—in an awful and unreal silence, such as had not been for four and a quarter years.

In the cities and the towns, where hopes and fears, exaltation and despair, ceaseless toil and energy, politics, and propaganda had been unending, day and night, men and women went wild with joy. It seemed a dream—too good to be true—and the pent up tension of the awful war period found vent in an hysterical display that for the moment carried the people off their mental balance.

The paramount thought was: "Our glorious heroes, our own dear boys will come back to us;" and glorified faces in the vast crowds told of those who still had dear ones to return—and then a further thought, and deep and sincere sympathetic sorrow went out to those whose fathers, husbands, sons, daughters, brothers and sisters were heroes for the cause—the men and women who had died that the Right might prevail; that the destiny of the world might be fulfilled. We mourn the loss of our dear comrades of the Alpine Club. They died for our sakes and for the sakes of posterity—but it could not be otherwise where men are real men and women real women.

The soldiers of the Allies have fought the Good Fight with incomparable honour and glory. Their records are forever graven on the tablets of their countries' history. Not least among such records are those of the Canadians and of the Americans—Lens, Vimy Ridge, Festubert, Cambrai, Ypres, Mons, Chateau-Thierry, St. Mihiel, the Argonne bear witness.

Not least among these are the records of the individual members of the Alpine Club of Canada; Canadians, British, Americans. In all one hundred and thirteen known members, men and women, have been on active service since the war began. The highest known rank, previous to the war, of any member volunteering was that of Major. There are now 12 Majors, 9 Lt. Colonels and 2 Brigadier Generals. Below the rank of Major are: 26 Captains and one Hon. Captain (Mrs. J. W. Henshaw,) 1 Lieut. Commander (U.S.A.), 24 Lieutenants and one Hon. Lieut., French Army, (Mrs. Stanley Jones), and 5 Sergeants. Thus, out of 113 volunteers from the Alpine Club, who have been on active service, 79 hold commanding rank. *That* speaks for efficiency.

Of distinctions, the following have been won by the said members during the war:—

British—C.B. 1, C.M.G. 2, D.S.O. 8, (and 3 Bars) M.C. 9 (and 1 Bar), D.C.M. 1.
Foreign—Cross, Legion of Honour 2, French

Croix de Guerre 4, Belgian Croix de Guerre 3, Crown of Italy 1, Rose of Italy 1, Order of Leopold, Belgium 1.

Eleven have been killed; two have been prisoners of war and a dozen or more wounded, some several times—*That*, speaks for valour.

It is a glorious record and one that might have been expected of mountain men and women in a period of such magnificent heroism.

An incident has come to us recently where the experience of mountaineering has been useful during the war:—A letter received by our Secretary-Treasurer, Mr. Mitchell, from Capt. A. W. Wakefield—who holds the north of England record for a 24 hour run over a mountainous course (where he made something like 80 miles)—says "Today I have for the third time during the war been grateful for my climbing experience. There was a Boche flag on the top of a tall Marconi pole at the summit of the Citadel here in Namur, which had flown there ever since we evacuated, but I succeeded in getting it down today."

Another instance where mountaineering has been useful to one of our members on service is to be found in the article appearing in the last issue of the Canadian Alpine Journal (1918) from the pen of Col. C. H. Mitchell, General Staff Officer of the 2nd. British Army.

A full record of our members on active service will be found in the next issue of the Journal for 1918, in so far as we have been able to obtain information.

Since our last Anniversary two more members have acquired the greatest honour of all: Lieut. J. Tyler (U.S.A. Air Service) and Lieut. T. J. Taylor of Victoria, B.C. Both were well-known to us—the former at our Ptarmigan Lake Camp, 1915, and the latter through the deep interest he took in mountain matters and his knowledge of the country north of Mt. Robson. We mourn their loss and our sincere sympathy goes out to their sorrowing relations. For the fallen little need be said. Their names are forever writ upon the tablets of Time. They occupy places in the "Temple of Fame" and "High o'er their seats the form of Time is found,

"His scythe reversed and both his pinions bound."

Of high Distinctions a number have been added since last reported in the Journal:

Col. R. P. Clark, Victoria, promoted to Brigadier General.

Col. J. A. Clark, Vancouver, promoted to Brigadier General.

Col. C. H. Mitchell, Toronto, appointed Commander of the Bath, and presented with the Rose of Italy.

Col. W. W. Foster, Victoria, presented with a 2nd Bar to the D.S.O. and with the French Croix de Guerre.

Major F. A. Robertson, Victoria, presented with the D.S.O.

Major, the Rev. A. M. Gordon, Ottawa, presented with the D.S.O. (Promoted Lt.-Col.)

Major W. M. Pearce, Calgary, presented with the M.C.

The Land of Caves and Campfires

Where to go fishing and camping.
Don't trust to hearsay—ask head-
quarters.

You need not go half across the
world to enjoy the pleasures of camp
life.

You need not go hunting grizzlies.

The land of caves and campfires is
within a few hours of your home.

Tents, cook kits and camp furni-
ture, for the all-summer family camp,
or for the week-end canoe or motor
trip.

Constant reports from the best fish-
ing streams and lakes—and the most
complete fishing tackle department in
America.

Camp Clothes, footwear, guns,
revolvers, ammunition — complete
outfits for every part of the country,
and necessary particulars concerning
guides for parties going into the big
woods.

Write us for full information regard-
ing your proposed trip.

Capt. A. Morkill, Vancouver, presented with the M.C.

Lieut. T. J. Tyler (U.S. Air Service) presented with the French Croix de Guerre.

There are doubtless others that we have not heard of yet.

Already a number of our wounded heroes have been returned to their homes and I feel sure will be found participating in our Anniversary functions, for the strenuous and harrowing years of war do not seem to have loosened the lasting grip of the Great Hills. Though battered, weary and worn—many incapacitated from active mountain climbing—they return immediately to the old love and, even though their bodies may be unable, their spirits are with us and will be as long as they live.

Even before our next Camp, "The Victory Camp" comes off, it is likely that the majority of our Overseas members will have been returned to their homes and that many of them will be with us on that occasion. God grant they may. The Alpine Club of Canada must never forget that it is due to the loyal and loving adherence of our members on military service that the Club has been able to come so successfully through this desperate period. It is to such adherence, given—even in the midst of the absolute and strenuous demands of a life and death struggle and all its horrors, that we are today indebted for the solid base upon which we stand. I think it is wonderful—wonderful beyond measure—that such a thing could be; and it goes to show that the grip and comradeship of the mountains binds closer than even the demands of war a l'outrance.

To these heroes all honour is due. They have created for us a tradition beyond belief, and we plan in 1920 to hold a great "Welcome Home Camp" at Mt. Assiniboine and to have there all of our soldier members—men and women—who will be our cherished guests,—and to there and then express to them the very high esteem in which we hold them, and the superlative admiration we have for their mighty deeds of valour. It was not to be conceived that such men and women existed, and it remained for the greatest war of all time to produce these supermen and superwomen.

We have heard from our two members who were prisoners of war: Capt., the Rev. Gillies Wilkin and Sergeant W. A. Aldritt. Thank God, they are again with their kindred in the Empire to which they belong. Their trials and sorrows have been great, but their greater hearts have carried them through and have won for them the respect, admiration and gratitude of all true men and women for all time.

The close of the war has brought to us a sense of deep seated relief. Once more we are able to let our thoughts—without treason—dwell upon the mountains; upon the billows of fleecy clouds that adorn Canada's highest peaks; to see in our mind's eye the shimmer of the icefall; to gaze with wonder at a crashing avalanche, or a thundering rockfall; to trace the silver network of the streams, winding in sinuous curves far below; to spot the gem-like lakes of glorious greens and blues,

scintillating with myriads of diamonds that sparkle from their sun-kissed wavelets, or else see mighty snow-clad peaks reflected in their mirror-like surface; to smell the aroma of the pine and spruce while wandering in the midst of mossy, fern-grown forests; and, best of all to sense the pungent wood fire smoke, lazily curling upwards towards the starlit dome of Heaven, as we lounge around the Great Camp fire and join in the jolly lilt of a chorus or song, while the soothing pipe of peace in such surroundings belies the din and horror of the dreadful past—gone, let us hope forever.

This and all this has been the guiding star of our comrades of the great war, and has held them as by a steadfast anchor, throughout the period of din and strife, to a realization of their dreams.

I regret to have to record the death of Miss Margaret Springate, a victim of the recent epidemic. Miss Springate joined the Club in 1909. She was one of our most actively active members and a good and fearless mountaineer. She participated in a number of our camps and was well-known to us as Secretary of the Winnipeg Section; also a frequent visitor at the Banff Club House. We shall miss her co-operation much.

And now to touch upon matters of more casual importance in the routine of the Club's progress. We have come through the war in good shape, thanks to the loyal support of our members. For the first time in years we went behind in our balance of revenue and expenditure, but only to an extent of about \$250, an item we shall easily pick up this year.

Apart from this the Club has no liabilities other than its outstanding Club House debentures, due 1st. of May, next. It is not possible to meet them in full, owing to the falling off of revenue during the past four years, so a plan has been proposed to pay ten percent. of the principal over a period of ten years at the usual rate of interest, with the privilege of paying in full at any due date of interest.

The plan was submitted to all debenture holders and a considerable number have acquiesced in it. Many debentures have been donated to the Club and the outstanding indebtedness amounts to about \$3400, for which we have assets of more than three times the value. No difficulty is anticipated on this account.

The 1918 Annual Camp was held at Paradise Valley, on the site of our old camp site of 1907, with an outlying camp at Consolation Lake, on the site of our 1910 Camp. The main Camp was in charge of the Secretary-Treasurer, Mr. Mitchell, and of Mr. C. H. Richardson of Calgary, who for many years now has so efficiently looked after construction for us. The outlying Camp was in charge of Mr. T. B. Moffat of Calgary and was managed in his usual very popular manner.

Although making all plans and preliminary arrangements for the Camps, I was only able to be present for the Annual Meeting of the Club. It took me nine days of travel, and very difficult travel at that, to get from and back to my work on the Interprovincial

A Journey of Joy and Contentment

COME where the mighty rivers of Canada flow onward to the Sea—take a boat trip on those rivers, let your eye drink in the delights of a scenic panorama that has no equal in America—let your mind become refreshed with a change of scene so complete that all cares will be forgotten in the engrossment of a journey that brings new interest with every mile—new wonderments with every hour. Well named

“NIAGARA to the SEA”

this trip begins with the beautiful Niagara River; traversing Lake Ontario and some 250 miles of the mighty St. Lawrence. It takes you through the 1000-Islands Scenery—it gladdens the eye with glimpses of green-clad river banks—it thrills you with the novel experience of shooting mile after mile of Rapids. It gives you stop-over privileges at such point, of interest as, Toronto, Montreal and Quebec—also at Murray Bay and Tadousac where splendid Summer Hotels are operated under Canada Steamship Lines management.

The climax of this 1000-mile journey is reached when the boat steams slowly up the magnificent canyon of the River Saguenay—where the traveller's amazement is tinged with awe as he beholds Capes towering higher than the Rock of Gibraltar.

This glorious outing affords you an opportunity of seeing the most picturesque part of Canada, from the deck of a palatial steamer. You will return from such a trip refreshed and invigorated—satisfied, too, that you have had the finest boat trip holiday it would be possible to conceive.

ARE YOU TRAVELLING WEST ?

Break the long journey; travel by boat from Sarnia to the “Soo,” Port Arthur or Duluth. Write for particulars of Upper Lake Cruises through the Great Unsalted Seas.

VICTORIA SQUARE

Boundary Survey, which lay a long way north of the Canadian Pacific Railway.

The Camp was much enjoyed by those present. The attendance was small, only 54 in number altogether. The small attendance was largely due to the fact that no reduced fares were given by the railways and that all except strictly business travel was discountenanced by the Government to give precedence to war requirements.

The Manager in Chief of the Canadian Pacific Railway Hotels, Mr. F. L. Hutchinson, again loaned to us two of their Swiss guides, Edouard Feuz and Christian Hasler, who are old friends of ours and gave us their faithful service. Some good climbing was done in a quiet way.

At the Annual Meeting a resolution of greeting was drawn up and, later, sent to our members overseas; also one of sympathy and encouragement to our prisoners of war. They appeared to give much gratification. The usual resolutions of appreciation and thanks were also passed.

At the close of the Annual Meeting I visited the Yoho Glacier and made the usual measurements for advance or retreat and for flow of the ice tongue. These have been carried on continuously since 1906.

The Club House was open from 17th June to middle of September and was, as usual, in charge of the Secretary-Treasurer with Miss E. Savatard in charge of the domestic arrangements. The attendance was very small, and but for the fact that it is necessary that the house should be open during the summer months, to keep it in repair, it would have paid better not to have opened it.

Apart from the Annual Camp, little climbing was done by members during the year. Mr. Val A. Fynn of St. Louis made numerous expeditions and climbs in the vicinity of Lake Louise and Lake O'Hara. The chief features of these were new routes up Mt. Temple and of the Victoria and the Lefroy-Hungabee Ridges. Mrs. Fynn made the first ascent for a lady of Pinnacle Mt. and accompanied Mr. Fynn on several of his other climbs, particularly one of the Victoria Ridge.

Last summer Mr. Fynn renovated and equipped to some extent the cabin in the meadow near Lake O'Hara, which he refers to as Wiwaxy Cabin. This was a generous and public-spirited action and one that is worthy of our gratitude. The matter of cabins at suitable places in the mountains, to facilitate climbing and other expeditions, has long been in our minds, but we have not yet succeeded in attaining a financial condition where we can give active expression to our wishes. In keeping open and running our club House and Camp at Banff we have, for the moment, reached our possible achievement in this respect.

My dearest wish for many years has been to build and place at the disposal of our members for climbing activities a suitable little Chalet on our location by the shores of Lake O'Hara. The difficulty in connection with it is not so greatly the building of it, but the keeping of it open for use and the financing of sufficient help to operate it. I sincerely hope that soon, prosperity may overtake us,

and that we may be in a position to build there. Its utility will, of course, depend upon the demand for the accommodation it would furnish.

The Journal was published as usual and was in its usual good style. It elicited some very favourable comment and particularly so the illustrations, which were exceptionally good, especially those by Dr. Bulyea of Edmonton. Publication is now a very expensive luxury and it is largely to this cause and that of the help and food problems that we were behind at the end of the year.

So much for the past—what of the future?

Three years ago the citizens of Banff, in good sporting spirit, organized an Association of Winter Sports and held a Winter Carnival at a considerable loss financially. Notwithstanding the loss, a second Carnival was brought off the year following with much success. The first year's arrear was picked up in addition to current expense.

Last February a third Carnival was brought off and was again a success. The glorious weather, the bright blue skies, the snow-clad surroundings and the exhilarating ozone of winter in the Great Hills filled all who participated in it, with delight and proclaimed great possibilities for the future. Your Director, realizing that these sports are closely allied to the activities of our Club, and that the future may render possible their application to our Club House at Banff, as an adjunct of the Carnival, attended the last two occasions and rendered all possible assistance towards their success.

So appreciative of our collaboration were the members of the Association that for this year the Director was elected an Hon. Vice-President, and, at the Sports themselves, Official Judge of all events.

It is I think a wise policy for the Club to render all possible assistance and co-operation. Last year we contributed to the general expense fund of the Association for Carnival purposes, and this year we gave a handsome silver cup to be competed for by Ladies' Hockey teams. It was won by the Regents of Calgary after a very strenuous contest with the Monarchs of Edmonton.

In my last year's address, I referred to an invitation we had received from the Club Alpin Francais to participate in a Congress of Alpinism to be held at Monaco after the war. Matters in this connection have progressed and it has been decided to hold it in the Spring of 1920. Baron Gabet of Paris is President of the Congress. On the Presidential Committee, the Alpine Club of Canada has been given very full recognition by the inclusion of our President, Mr. J. D. Patterson, our two Vice-Presidents, Colonels Mitchell and Foster and myself as Director of the Club. I have the matter now in hand and am endeavouring to arrange a full representation and exhibit. For the latter I hope to induce the Government to send over Mr. Byron Harmon of Banff with his magnificent moving picture films of climbing and travelling in the Canadian Rockies.

Our Annual Camp this year will be held at the summit of Yoho Pass, on the site of our first camp in 1906. It will last from the 22nd

LOUIS RHEAD Hand Made NATURE LURES are now ready. 4th SEASON 1919

Heretofore, the maker of nature lures trusted entirely to personal tests of them. So many appreciative letters are received, anglers may be interested in the following sample from an eminent M.D., fishing in Maine—

Dear Sir:—

Enclosed find five dollars, for which please send an assortment of nature lures for Trout. I used the lures this summer and had the **grandest sport of my life**, taking ouananiche with them in two trips. I used them at one pool where flies, worms and live bait were being used, and brought to net **more fish than four other rods**. I lost my last feather minnow this week and wish to be prepared for next season."

Send for new illustrated leaflet with additional testimonials.

NEW HAVEN, CONN.

of July to the 5th of August inclusive. It will be styled "The Victory Camp" and we then hope to have present a number of our returned soldiers—men and women. An outlying camp will be placed at the mouth of the Upper Yoho Valley.

At this camp several matters of importance will be taken up, noticeably:—the arrangements for the big "Welcome Home Camp" at Mt. Assiniboine in 1920, when we hope to have the majority of our returned men

and women members there as our guests.

We have also to consider an appropriate memorial to be erected at the Club House to our soldier members.

The Club House will be open about the first of July and it is hoped the attendance there will be greater than during the past two years. The officials in charge will be the same as last year.

ARTHUR O. WHEELER,
Director.

Criticism From a Bisley Marksman

Editor, Rod and Gun:—

In your November and December issues, considerable space has been devoted to organizations and praise of The Irish Rifle Club of Toronto; much of this has been contributed by one J. W. Smith, who we presume by his remarks must be a member of the Club, and an amateur at shooting, not one of the old marksman class, such as the D.R.A. or Bisley type, while one must not overlook the fact that this Club is a civilian organization.

In referring to the by-laws, I quite agree as to the purposes for which this Club was organized in, I believe, about 1912 or shortly before the war broke out. Now did this Club carry out all the purposes for which it was originally intended, that is promoting range rifle shooting, because at the very beginning I would like to ask the writer, J. W. Smith, (who should be familiar with the by-laws) if as he says "nearly all members" are accepted, but there are many who could not become identified with this Club, why? As to further discussing this point I would only refer you to the emblem of the Club.

The original members of the Club were all crack shots who were very nearly all members or ex-members of some militia regiment of No. 2 military district, and with their respective units had received their early training in musketry, some advancing so far as to be eligible for Bisley teams. Now about the time 1914 when the war broke out, every

marksman knows how all Ontario and Dominion matches were called off, owing to the war nothing in this line being conducted since, the country had its military affairs to deal with then, and musketry of practical nature was at once taken up at the various big camps. However, The Irish Rifle Club, Toronto, continued shooting during the war at Long Branch Ranges situated a few miles west of Toronto, but what was the practice, merely shooting at the 200-500-600 yard range season after season, without the slightest variation. Now who could not become very nearly perfect, if he had any knowledge of a rifle. And I understand most of the members have used special match Ross rifles, some possibly who were not so fortunate had to use the regular issue of the militia, but as to the actual number of members who were taught anything in marksmanship, I would venture to say it would not be such a great number in proportion to membership.

While Mr. Smith leads one to think that the contests were according to O. R. A. rules, it seems that possibly he may never have familiarized himself with the rules, and apparently never was in competition in O.R. A. matches.

During the war every person interested in musketry knew the difficulties that confronted them, and for this reason many old, time shots became identified with the I.R.C. this more particularly during the last couple

of years. But of course the I.R.C. claim all the honor for such good scores during their season's practice, but when we look at the names, many of which are so familiar in connection with various old regiments of Toronto and big shoots held throughout the Dominion before the war, and as Mr. Smith says have been to Bisley, which I quite agree, it would seem more sport than instructional musketry, as many of these men won their laurels under the distinction of their own regimental units, and if Ontario and Dominion Associations should be revived again, you would find these old time marksmen lined up in their former place and I would venture to say the actual members left in the I.R.C. of Toronto, capable of making scores such as published in the December issue of *Rod and Gun* would be few. Quite an ordinary team, without scarcely any practice composed of members of the Toronto Board of Trade defeated the famous Irish team at Long

Branch ranges in 1915 and were defeated during the season of 1917-18 in the indoor matches by North Toronto team. Also in the January issue of *Rod and Gun* much praise again is given one J. Sharpe, who exhibits four targets, while we are told these were made at 75 yards, I do not for a moment believe any such targets were made at that distance; if these targets are as they appear indoor regulation, one could scarcely see the bull's eye at all. Then, of course, one is not furnished any details of target or calibre of ammunition used, as any shooter realizes how much easier it is to make bull's eyes with large bullets such as .303 gallery than .22 gallery. Therefore, the writer cannot agree that this is such a brilliant exhibition of indoor marksmanship as I personally have seen just as good performance many times before.

Bisley Marksman.

Needless Slaughter of Big Game

ALEX BLEAKNEY

The morning of the fourteenth of November, 1916, dawned with a heavy mist, while underfoot there was a few inches of snow. But the weather conditions only acted as an additional incentive to our party of six hunters, Lewis Irons, Edgar Wilson, Leslie Robbins, Charles Alwad, Lloyd Bleakney and myself.

We entrained at Salisbury, N.B. for Berry Mills where we were to make connection with the Lakes train. It was our annual hunting party and needless to say we were as happy as lords.

The first day in the bush found nothing of interest except greatly improved appetites but Robbins mentioned passing a buck that had no horns. "It never moved" said he and we all thought this very strange. He said that it was the tamest moose he had ever seen in his many years experience with big game.

The next morning I set out to investigate strange occurrence that Robbins had mentioned. Sure enough there was a big moose and a bull at that. A glance told me that he had knocked his horns off. A closer examination revealed the fact that he had been wounded and had been lying in the one position for a week. Some heartless brute had shot him and left him to suffer. What common curs

there are that infest our game fields! There are numerous people that shoot for greed and others for slaughter; in order to satisfy a lust for destruction.

The pot hunters had shot all the deer and moose even in our old game haunts which had been formerly ideal hunting grounds. A few more men of the stamp of Kerr of Essex County is the crying need of our country.

The following letter will be read with great interest by the writer's hosts of friends. Mr. H. Mortimer Batten is one of *Rod and Gun's* frequent contributors.

The Gables, New Galloway,
Scotland, 14th, March 1919.

Editor, Rod and Gun.

Dear Sir:—

I have to thank you for the four books safely to hand. I am reading these with very great interest, and find they contain just the information I was wanting. The hints on making various things in "Camp and Trail Methods" are excellent, while "The Science of Trapping" and "Steel Traps" describe many excellent sets.

The knowledge contained in these books should be sufficient to give any boy a start—a foundation on which to build up his own ideas. One cannot read how to trap any

Best British Briar Pipes

You, as a keen lover of all outdoors, cannot conceive of a more dismaying circumstance than an outing trip minus a First Quality Briar Pipe, a reliable blend of tobacco and your matches, "Now can you?"

Let your Pipe and Tobacco be your first consideration. Buy a real eight year matured French Briar London Made Pipe with hand cut vulcanite mouthpiece and sterling silver band, plain but the very best, now as formerly \$2.50 each. A plain statement in your letter of what you desire, bent or straight shape, medium, large or small bowl, is quite sufficient to suit you.

Gerth's Smoking Mixture, an absolutely pure unsweetened blend of four of the choicest imported tobaccos, on sale ever since 1880, is a well balanced mixture, satisfying, tasty, mellow, absolutely reliable. Owns a host of staunch friends. Selling at \$2.60 per pound.

The following offer to Rod and Gun readers:—

One first quality London Made Briar Pipe.....	\$ 2.50
One pound Gerth's Smoking Mixture	2.60
One London Made leather pocket pipe cover.....	.50

Prepaid to your address for \$5.00.

\$ 5.60

PATENT PENDING

more than one can read how to shoot or play billiards, but by reading one can cut short many of the initial failures by starting out on more or less the right lines. Later one develops one's own ideas, for originality and a bit of inventive genius are as essential to successful trapping as are good traps and tobacco. Many an old hand too will find good books on the subject a source of new ideas.

Thanking you again,

Yours faithfully,

H. Mortimer Batten."

Mr. Julius Lindberg of Jordan, Montana certainly thinks *Rod and Gun* is a good magazine. Under date of March 29th he writes:

"I am one of the lucky ones to come home from the war and it certainly was great to find *Rod and Gun* right on the table looking at me when I got back. It gladdened my heart like no other book or news could, outside of the glad news of the armistice. After lining up the French .75 on the Hun and being away from friends and relatives *Rod and Gun* seemed to be the true welcome home after all."

Mr. Linderman was overseas with Battery "A" of the 37th Field Artillery.

An interesting series of war commemorative stamps has been issued by Newfoundland. The device chosen for the issue is the design of the Colony, being the head of the caribou. Under the head in eight of the values is the inscription, "Trail of the Caribou" in a ribbon scroll intertwining oak leaves, beneath which is engraved one of the battles recording the valor of Newfoundland regiments. For example the one cent stamp bears the inscription, "Suvla Bay." This was received on an envelope containing a renewal to *Rod and Gun* from Mr. W. A. Sclater of St. John's Newfoundland.

The Keystone Camping Club who hold an annual camp at Washagaming, Northern Ontario have issued their 1919 camp folder. This very interesting little brochure contains a paragraph that does credit to the organization. All true sportsmen will agree with the following reprint:

"As in former years the club has always stood for good sportsmanship and insists on the strict observance of the Fish and Game Laws,

and while you are quite likely to meet with deer, moose, bear, otter and beaver, there is no necessity, and it is urgently requested, that you do not bring high power guns along. There is always danger and there is no game in season. The club is justly proud of its record of never a fatality in its entire existence"

APPEAL TO SPORTSMEN.

I am alarmed to see the great number of male bluebills on the northward bound spring migration—as I write fully 20,000 wild ducks surround my island—of these fully 15,000 are males. If we all try to kill drakes next fall we will help a-bit. This family of the wild duck is holding its own in numbers but the foolish females are lessening yearly.
Bonnycastle Dale.

The angler who takes a pride in keeping his tackle in good condition at all times would do well to look at the Tak-It-All Case illustrated on page 111. The beautiful exterior finish of mahogany, walnut and oak together with the all-wool interior construction, combine in making a tackle case that is second to none. One splendid feature of these cases is the separate plush-lined compartments for reels.

On the coast is found the great Indian fishing owl, and among the rocks of Marsaba the monks have half-tamed the orange-winged black-bird, which is really a starling of African type, as much out of his latitude as the hyrax. One of the birds peculiar to Palestine, the pretty little pigmy Mobite sparrow, which lives in reed beds, is one of the rarest birds in the world.

Reptiles abound, and even the Nile crocodile, the leviathan of the Bible, lingered long enough to give Tristram the chance of obtaining a specimen nearly twelve feet long, while in addition to the African cobra, we find the grass snake among the harmless species, and the wicked little horned viper lies in wait, as in olden times, to bite the heels of the horses.

As for the fish, they are as abundant and varied as cerfi, and it is interesting to note that the Sea of Galilee is still packed with them, and that the commonest kinds are of an African family, an interesting illustration of the scientific interest which unites with the religious to make Palestine among the most interesting of all countries.

NORTHERN ONTARIO

This vast new land of promise is one degree south of Winnipeg, and is big enough to include the six New England and four Middle States of the American Union.

Aside from its immense resources in timber, mineral, waterpower, fish, game and scenery, NORTHERN ONTARIO contains millions of acres of fertile, arable land fit for mixed farming which may be had in some districts at 50 cents per acre, and in others FREE.

Already there are thousands of miles of colonization roads and steam railways spreading like a spider's web over a huge part of that immense forest-robed territory.

For free descriptive literature, write

H. A. MACDONELL, Director of Colonization, Parliament Buildings, TORONTO, CANADA

G. H. FERGUSON, Minister of Lands, Forests and Mines.

ASSEMBLE YOUR TACKLE IN A TAK-IT-ALL CASE

THIS one was not made for some other purpose and then converted for tackle—it was made for tackle. You will value it because it is light and can carry your complete equipment—all in its separate compartments, with a plush-lined compartment for reels.

The all-wood construction eliminates noise and rust. Furnished in mahogany, black walnut or fumed old English or golden oak. Three sizes as—

No. 1, 12in. length, 8in. high, 8in. deep.	Price \$ 9.75
No. 2, 13½in. " 9in. " 8in. "	" 11.50
No. 3, 15in. " 10in. " 9in. "	" 14.75

CAILLE Rowboat Motors

Now for a Day of Real Sport

A DAY full of exhilaration and fun. A day of roaming about over river and lake—now "still fishing"—now trolling—now just skimming along the shore line—just exploring. And all day long never touching a hand to an oar—never a backache, armache or a blistered hand. Just fun—pure, unadulterated fun. Have you ever longed for such a day—ever wished you could afford a little power boat and could bid good-bye to oars and paddles? You can do that very thing now. You can get an inexpensive

Liberty Drive ROWBOAT MOTOR

and attach it to any rowboat and you have a launch. It's so simple and dependable any one can run it. It operates on the same principle as motors in big launches. The shaft extends straight out from the rear of the boat. The engine is in a vertical position. The drive is direct from engine to propeller. The entire motor pivots on stern of boat. Can be raised or lowered by pressure on steering handle. Steers by swinging propeller to right or left. Propeller rises over stones, sunken logs or other obstructions. Goes through weeds like an eel. Drives boat right up on beach. Has speed of 5 to 10 miles an hour. Weighs about 70 pounds.

\$58⁰⁰

Complete Ready to Run

Get the Details

Go to your sporting goods dealer. If he hasn't a Liberty Drive Motor, write us, giving his name. We'll see that you get the details promptly.

We Also Build

inboard motors from 2½ to 30 horsepower. Send for details. Give length, beam, draft and type of your boat.

No. 50

All elastic. Perfect fit. Self-adjusting, will not chafe. No buckles. Pouch open in rear, therefore more sanitary. Perfectly comfortable. Need not remove from scrotum while at closet.

All Sizes . . . \$1

CANADIAN WINS AMERICAN TITLE

With a score of 197 out of a possible 200, J. E. Jennings of Todmorden, Ont., won the national amateur trapshooting championship at clay targets over the traps of the New York A. C. at Travers Island on May 4th.

This is the first time in the history of the event that the title has been won by a non-resident of the United States. Jennings was in fine form, as he missed only three out of the first hundred and scored 100 straight "breaks" in his second round, establishing a new record for this shoot.

F. S. Wright of Buffalo, who won the New York State championship earlier in the week, finished second with 195. C. A. McCarthy of Philadelphia, a former national champion, took third place after shooting off a tie with Mark Arie of Thomasboro, Ills., and J. B. McHugh of Wilmington, Del. Each of these had a score of 194 and finished in the order named in the shoot off. Five others tied for the remaining five prizes.

Following is the order of the ten prize winners, together with their scores:—J. E. Jennings, Todmorden, Ont., 197; F. S. Wright, Buffalo, N.Y., 195; C. A. McCarthy, Philadelphia, 194; Mark Arie, Thomasboro, Ill. 194; J. B. McHugh, Wilmington, Del., 194; M. S. Hootman, Hicksville, Ohio, 193; J. Clarke, Jr., Worcester, Mass., 193; W. H. Yule, New York A.C., 193; J. B. Johnston, Pittsburg, 193; C. Burmeister, Chicago, 193.

TORONTO GUN CLUB

A Hulme was again winner of the Toronto Gun Club spoon event held on April 18, and also of the sweepstake. Arrangements are almost complete for the Eastern Canada trapshooting tournament, which will be held on these grounds under the auspices of this club on June 11, 12 and 13.—The following were Saturday's scores:—A Hulme, shot at 100, broke 88; G. L. Vivian, 125-104; G. Nutson, 100-71; C. C. Richardson, 50-39; Wm. Hughes, 75-60; J. Leedham, 85-66; E. Y. Hutchison, 70-54; G. Mason, 75-52; J. Jeffers, 25-18; R. Wood, 45-22; F. Cockburn, 40-31; J. Fowler, 45-26; J. Murphy, 90-79; N. A. McDougall, 50-25; E. Roach, 50-36; H. Smith, 25-14.

The regular weekly shoot of the Toronto Gun Club was held on April 26. J. Leedham was the winner of the spoon event, while J. Colborne captured the sweepstakes.

A great deal of interest was taken in the team shoot, in which two ties had to be shot off before a winner was declared. H. Cooley took home the bacon. The following were the scores for Saturday—

	Shot at	Broke.
J. Colborne.....	100	85
G. Nutson.....	100	57
Col. Curran.....	85	41
F. Cockburn.....	25	16
H. Cooley.....	115	89
G. Anstee.....	100	61
T. Marsh.....	100	58
W. Curran.....	100	69

Smith.....	25	18

**Don't Forget
the Milk**

**When supper time
comes 'round**

After fishing all day, with just a snack of cold victuals at noon to keep one going, a fellow does develop an appetite. When the shadows of evening fall, what a pleasant prospect it is to know that for supper there can be real-milk-flavored biscuits or flap-jacks (or may be a pudding) topped off with fresh sweet separated milk for your coffee. The real-milk flavor is possible only when you have Klim—powdered separated milk—the only milk you can take into camp that has the flavor Nature gave it and can be used just as needed from the tin. Make Klim into liquid form by simply dissolving in water. Your grocer will recommend Klim, he knows it will please.

May we send you this guide book?

An illustrated guide to points of interest in and around Buffalo, including Niagara Falls. Free on request.

When in Buffalo, stop at the Hotel Lenox, Buffalo's ideal hotel for tourists. Quietly situated, yet convenient to theatre, shopping and business districts and Niagara Falls Boulevard. First-class garage.

European plan. Fire-proof, modern. Unusual cuisine. Every room an outside room. \$2.00 up.

On Empire Tours.
Road map and running directions free.

DRESDEN GUN CLUB.

At the tournament of the Dresden Gun Club held April 12th the usual friends of Wes Hart put in an appearance for the annual competition, which was keen from start to finish, even though the weather conditions were not of the best. Fred Dolsen, of Chatham, trimmed the bunch of gunners to a peak by breaking 133 out of 150, which was excellent shooting under the prevailing conditions. D. McNeil of Florence, was second, with 132; R. Day of London, third, with 130; W. Hollingshead, 129.

Among the professionals Wes Hart came trailing home with 128, Geo. Dunk, of Toronto, 117, and G. H. Ford, of Indianapolis, Ind., third, with 112.

PETERBORO GUN CLUB.

The Peterboro Gun Club held their opening shoot on April 19. It was a decided success both from the point of numbers attending and the shoot. The weather was windy, and under the circumstances the scores were very good. Below are the scores:

	Shot at	Broke.
Chris Wood.....	60	48
B. Gillespie.....	60	41
J. S. Coon.....	50	39
J. Loucks.....	50	36
M. Hutchison.....	40	33

CREEKSIDE GUN CLUB.

The Creekside Gun Club held their last regular shoot for the season on April 18 with the following results: J. Colborne, first high gun; H. Peterman, second; R. Baird, first handicap; E. Robertson, second; Ed. Brown, third. H. Cooley won the special shoot at the doubles, first in the duck shoot and the spoon for the day. The scores: H. Peterman, shot at 70, broke 52; R. Baird, 70-51; Eli Elliott, 95-60; R. Watt, 95-60; Ed. Brown, 35-24; J. Colbourne, 120-95; W. Joslin, 75-58; E. Robertson, 60-45; A. Spiller, 40-32; Ned Elliott, 60-41; W. Le Cornu, 45-31; G. Anstee, 70-59; S. C. Cotterill, 25-18; H. Cooley, 105-89; J. H. Klein, 30-22; Ted Brown, 25-17.

TRAPSHOOTING REVIEW IS READY.

The annual review of the American Trapshooting Association with the averages of the shooters who participated in registered tournaments in 1918, is now ready. Trapshooters and other sportsmen who have not secured a copy of the review can secure same by writing the American Trapshooting Association, 460 Fourth Avenue, New York. One of the features of the book is the honor roll of amateur trapshooters since 1908. The honor roll comprises the leading 50 men each year. The records of trapshooting, a brief history of the sport, in fact everything worth knowing about the pastime is chronicled in this booklet.

TRAP SHOOTING IS THE BEST OF RECREATIONS.**CHARLES H. NEWCOMB.**

Amateur Trapshooting Champion of Pennsylvania.

Trapshooting is rightly called "The sport of kings and princes," because we find "The Prince of Good Fellows" a follower of same. The degree of cleancut competitive sportsmanship exhibited in this sport stands in a class by itself. We have all heard the old saying, "Show me a lover of a gun and dog, and I will show you a good fellow," and it applies equally to trapshooting.

Chases the Worries.

As a recreation, it is one of the best, as naturally the tired or worried business man cannot get out with a crowd of such friends as he finds in this game without being benefited. Furthermore, he cannot be successful at the traps without putting his mind on the game, as concentration of mind is one of the fundamental principles of trapshooting. In doing this he is giving his brains a treat from business worries of the past and strengthening and clearing it for future problems.

Helpful Exercises.

It is also a beneficial physical exercise. In fact it is only another demonstration of a popular form of exercise that was much exploited a few years since, viz.: The act of making one's muscles right and then relaxing, repeating same a number of times. This is exactly what the trapshooter does as he calls, "pull." His muscles are tense, and at the recoil of the gun relax, which performances he repeats 100 to 200 times per day as the program may call for. When the shoot is over he knows by his tired muscles that he has had all the exercise he needs for one day.

It is also a sport where quick judgment is necessary, as well as quick action. In fact, all of its environments are beneficial as it occupies the mind, eye and muscles, and trains them to act in unison.

MANITIBA ANGLERS ORGANIZE FOR 1919.

The Manitoba Anglers association re-organized for the 1919 season at an enthusiastic meeting held in Winnipeg recently. They propose to start an angling boom in the prairie province this year and already plans have been made to have a sweepstake contest for one Saturday afternoon in each month

in the Red and Assiniboine rivers. The Winnipeg Tribune in reporting the 1919 prospects states:—

"The anglers are looking forward to a most successful year and everyone interested in 'a worm at one end and a fool at the other' is invited to 'come along.' 'Yes, madam this invitation includes you.'"

Fish, Fishing and Fishermen

GEORGE R. BELTON

I was at a friend's house the other day and his son of twelve came breaking boisterously into the conversation with a request, nay a demand, for four dollars and a half to buy a fishing rod. And he got it too.

"Now when I was that boy's age," said my friend, puffing sententiously, "I—"

His wife sat back resignedly with the air of the woman who is married to a self-made man who is proud of the job. She expected to hear how he had warmed his feet on the places where the cows lay overnight and so on; but instead—

"I used to go down to the creek and cut a willow for a rod and spend a cent at Bannings for a fishhook, getting a string thrown in free from the counter. And then—whoopee; off to the dam or the bay, or even sneak a boat and brave the perils of a trip to the lake. Those were the days."

Yes, those were the days. A shirt, a pair of pants, and one suspender constituted a fishing garb, same as for any other summer purpose; just slip out of bed, run your legs through the pants, not too hurriedly lest a toe catch in a hole, throw over the one suspender, grab a hat and you were dressed for any occasion; your "other clothes" being a strait jacket for Sunday and funerals only. Often when a cent was not obtainable a bent pin would do for a fish hook. Now the lad wants "an outfit"—

and gets it. The modern boy is perhaps rightly called a "kid"; his father seems to be the goat anyhow.

There was more zip to fishing those days, too. Fresh meat did not come as plentifully then to the ordinary house as it does even in these days when "the war" makes beefsteak dearer in Winnipeg than in Glasgow or even Berlin, and a little fresh fish was often as welcome to father and mother as to the lad who caught them. The sweet rock bass and the perch, the sunfish, and even the mud-pout were a nice dish after days and days of salt pork—or perhaps corn beef. I remember once when I deserved a good licking; not so hard to think up such a condition, perhaps, but this was a special occasion. (And, by the way, dad, don't wonder if your boy does the things you used to do or things like them; just give him what you got; it fetched you through all right). Well, I thought I might as well be hung for a sheep as a lamb so I got a fishhook and a string, cut a rod at the riverbank, slew a frog for bait and fished till near suppertime. And I had a good string of fair-sized ones to tote home with a withe through their gills.

When I hove into the parental view my mother looked up in some surprise.

"Why, Georgie," she said "where on earth did you get the nice fish for supper," and she flew for the utensils for cleaning and fixing them.

"Your father will be pleased to see these" she said, as we sat down, "He just said at dinner that he was tired of salt meat."

Apparently in the crowd of an average down-east family of that day I had not been missed at dinner. This may be hooted by this generation in which I am commiserated as the father of two boys and two girls but in the woods in the old days that would have been commiserated in a different manner. One could easily overlook the absence of one child in a robust family of twelve or fourteen all possessing the fishing and field-roaming propensities of those care-free days. I have met all of the family into which I was born but one roof never covered us all; the older ones had married and "gone west" before I appeared.

And so mother and I sat down to clean and scale the finny ones with the two cats and one kitten purring near by, waiting for the heads. And the dog watching also. Ah, rest after toil is sweet; and safety after danger; and prospects of fried fish after a day's fast.

Those of us who have gone west have been disappointed in the fishing. I don't mean the total amount of fish caught in western lakes and rivers; that is enormous, and of fine quality. No fish excel the whitefish of Lake Winnipeg in number and in eating quality. And I hope few excel them in price either; for while tons of them rotted at the lakes last winter "for want of a market" and the fishermen got only two or three cents a pound there, the people of Winnipeg paid sixteen cents for them, uncleaned. The food board firmly declared that "whitefish at Winnipeg must not be sold higher than sixteen cents"—and whitefish, that had been till that week selling at fourteen cents, meekly rose to the occasion—and stayed there. So there was "no market," for any surplus; to ship down the surplus would destroy it; Q.E.D. That reasoning is superb.

But there is a lack of variety in the fish in the west. There are gold-eyes in the Red and Assiniboine, "jackfish" everywhere where there

is running water, whitefish in all large clear lakes, and mud-pout fairly well distributed; but these are about all you can catch. "Rivers teeming with fish" looks well on publicity literature but it does not pan out to the expectations of the man who has really fished where there were fish to get. I have seen Chinamen get fish at Saskatoon, but I have not the patience of a Chinaman, thank God. I have pulled out beautiful "jackfish"—everything is a jackfish in the west, in the lakes of the Riding Mountains and have fried them on a stone by a bonfire. But I never really fished in the west, like fishing should be done.

There is more sport when you do not know what you are going to pull up but are sure you will get something. To feel the hook safely taken and wonder if it is a bass or a perch or a mudfish or even an eel! Some pretend to know by the feel of the rod. An old fellow used to fish off the bank below the Parliament buildings in Ottawa. I never saw him catch anything, but one lazy day I went down and he got a "bite" just as I arrived. The line pulled and swayed steadily and the old man "gave him line" on approved style—meanwhile proving to me that it was a black bass he had hooked; he could tell unerringly he said, and proved this by an astonishing lore of fish wisdom. Then he pulled up the fish—and behold, an old boot.

Nevertheless, I have had some good times fishing in the west. I have caught a fine lot of firm, sweet pickerel in the lakes of Northern Manitoba and the other prairie provinces, and have fished through the ice with the Indians when no catch meant no dinner. And I have greatly enjoyed the fish fresh pulled out of the water; they lose taste very fast in a few hours—which is why so many people "do not like fish;" they never really tasted fish as the man does who catches them. Salt water fish, by the way, do not lose their flavor so quickly as the freshwater ones. And I have enjoyed fishing further west. Once I went out from Republic, in Washington

to spear salmon at a "riffle" in a mountain stream.

"One thing", I said, decidedly, to my wife and her sister who were with me; "I won't wet *my* feet for any fish that ever grew. It's all right in the movies to see a man up to his waist after them—but not any in mine, thank you. Me for the dry bank; safety first."

Then we turned a corner around a steep rock and the rifle burst into view—behold, the big fellows were splashing up the stream in a swarm. With a whoop, like a Comanche I grabbed the spear and ran full tilt into the stream stabbing and striking here and there at the fish as they dodged up the shallow rapids. Meanwhile friend wife and sister rolled on the grass in laughter at the man who would not wet his feet for any fish that ever swam. But I got some dandies. It takes some little skill to spear them even when the water seems running red with big fellows but I got the spear into one that weighed sixteen pounds; he felt like a good strong dog struggling at the end of the spear but we landed him; then some more too—in fact they say it was a very successful day.

Oh, well, there is always some discomfort in fishing, same as in real red-blooded hunting. It may be wet feet or something worse. But that is part of the attraction; no one enjoys a sport that is too easy. Even the very danger of some sorts of sport is an attraction. I remember seeing some fellows, and one girl, come in to Cedar Key down where they have built a railroad out through the sea to Key West below Florida. They had a tarpon or a tuna, I forget which, with them that had pretty nearly wrecked the boat and they had been attacked by a killer whale while they were getting the tarpon in; but I never saw more fully satisfied sports. They were going after the killer whale the next day. Few were ever seen there but they are fierce fighters—the wolves of the sea. I have never faced anything like that while fishing, but I would like to.

And the mystery of fishing, too.

That is an attraction. What lies beneath the impenetrable depths beyond our sight? We do not know; we can only guess and wonder! We know what lies in the boat above and at the fire that night; it is the fisherman himself. Fishermen's tales have always been the joke of truth; perhaps that saying "Tell it to the marines" comes from the connection. The propensity seems to be a part of the fisherman's character; men who are models of truth in other ways are far from it when telling of their fishing exploits. Perhaps the very mystery of fishing helps to add to this characteristic. For mystery there is. Ever since we shrank, as boys, from the deep hole in the Black Bay where Jack Askins saw a horrible thing put up a head like a nigger on the shoulders of a horse, and then go down showing a long body like a snake, we have felt the mystery of the deep water. Is not the sea-serpent merely Jack Askins' vision enlarged? And what is there in the octopus or devilfish that we did not see in the crab-fish "as big as a plate" that bit Sam Scobie when he played hookey from Sunday-school and went swimming?

But, after all "'tis a pleasing fear," as Byron hath said. The relaxation is the thing you really get in fishing. It supplies a reason to sit still and let your thoughts ramble. And they do ramble. Witness this article. Some-times I wonder about it a little, too. If a fish could cry out in its death agony as it flops convulsively on the bank, would we be so fond of fishing? You see in spite of movie picture arguments we really are more affected by hearing than sight or we could hardly enjoy fishing or look on idly while the fish gasps out its life. Imagine a dog passing into death with these struggles accompanied by his howl!

No! Don't bother imagining it. Just go on fishing the same as I am doing. Enjoy the little discomfort, the mystery and the sport, and take your needed rest and the loitering which only fishing gives excuse for. I sort of wish I hadn't written the above paragraph—but perhaps some who never thought about it will

either put the fish out of pain or keep them living till needed for the table.

Any how, let us see if we cannot have a real boys' time of it this summer for at least a week's fishing.

Ontario's Trio of Nature Gardens

Muskoka, Lake of Bays, Algonquin Park

FRANK YEIGH

CANADA is a land of nature gardens; of far-flung and untrammelled playgrounds; of regions of the wild, where the world is unspoiled by the creations of men, and where these same men may revel to their heart's content and grow both young and strong again through its elixir of life.

This is true of each of the nine-linked chain of provinces, spanning the continent-wide distance between oceans, and pre-eminently so of Ontario, the province that holds within its extensive boundaries such delectable realms of rustic attractiveness as the Muskoka Lakes, the Lake of Bays and the Algonquin Provincial Park.

Here there is room for all who come, and multitudes more; here forest and glen; wooded and carpeted isle and clear-hearted waterways give welcome to all who have the password as lovers of the wild and worshippers at the altars of nature; to all who love the caress of the wind, the fragrance of the flowers and the odor of mother earth; a sky rather than a ceiling; stars more than candles, and who make friends with the little furry folks of the undergrowth, or the winged creatures of the upper air and the tree branches.

To him who in the love of nature holds communion with her visible forms, who speaks a various language. So it was with Byrant; and to Longfellow,

"Nature with folded hands seemed there

Kneeling at her evening prayer."

It is a striking transition, made in a few hours' railway run over the Grand Trunk Railway, from a city

like Buffalo or Toronto, to Muskoka Wharf, the gateway to the Muskoka garden, specially if it be a summer day when the sun is trying to melt pavements and wither flowers and folks. To pass from heated city streets to the deck of a tidy little steamer, looking spick and span in her dress of white, and from the deck to drink in heaven-sent draughts of cooled air, is to enter an eldorado where "Every prospect pleases" and nothing is vile—not even man, as another poet slanderously asserted.

A water journey of half a hundred miles makes the rest of the day a rarer one than even in leafy June. Thus the Three Graces—as the trio of lakes are called; Muskoka, Rosseau and Joseph,—constitute a wonderland of sylvan beauty, a paradise of lake and stream, of forest and island, making a maze of channels that in turn create a picture gallery of ever increasing charm.

There is just enough evidence of human occupation to relieve one of loneliness, though it is but a step from any landing to an Adamless and Eveless Eden where the Lucky Traveller finds himself "in the heart of things," and "the woods are round him heaped and dim." The summer resident has long since discovered this northern retreat, and has built the ubiquitous summer cottage, fancy little houses lining the winding shores, most of them with their feet in the water, and their open windows and doors and spacious verandahs advertising Muskoka hospitality, which is a most choice brand. And, moreover, where there are summer cottages there are also summer hotels, big and little, with all sizes in be-

"The visitor to the Highlands of Ontario steps from the Pullman to the natty little steamers which take him to all parts of the lakeland kingdom."

tween not to mention the tented homes of other dwellers of a day who live the true Bohemian life and get

"back to nature" long enough to re-establish sanity and a right perspective of life.

So thousands annually find balm and healing; physical reconstruction, mental therapy and spiritual uplift in this Land of Little Lakes, as Kipling happily termed it; so many find heaps of fun, whether hunting or fishing; sailing or motor-boating, visiting or dancing, or just taking it easy until, in the exuberance of it all, they gladly avow the colloquialism; This is the Life!

And it is. Just try it and see, as I've done times more than a score. The proof of the pudding is still the same. The garland of lakes and their guardian legions of islets little and larger, always have a welcome, just as the air is for the most part ozone-filled, with a resultant appetite in keeping.

The same word is true of the Lake of Bays district. It is Muskoka-plus. Another two-hour run, in a north-bound train, introduces the pleasure-seeker to Huntsville, and Huntsville re-introduces the visitor to a chain of waterways that almost create an invidious comparison with even Muskoka, though each realm has its own individuality and distinction. Fairy Lake—Peninsula Lake—Lake of Bays; do not the very place-names allure? What a dazzling shimmer their dark waters carry? What battalions of white-tipped waves race over the course when the wind whistles almost to a gale between lands and islands. "The shortest railway line in the world," makes a portage, between lakes, to another comfortable craft that covers the last lap of the journey right to the front door as it were of the famous Wawa Hotel, whose circling wings give a happy impression from a distance of extending open arms of greeting to the wayfarer.

It is moreover, a suggested greeting that makes good. What pleasant memories one carries away of "comfy" beds, of good meals, with good music and good-cheer; what exciting games of golf on the excellent nine-hole course, and, by every word of truth, what fishermen's tales one hears, only matched by the hunter's yarns or the pioneer's experiences of the old settler who made his way northward long

before the Grand Trunk whistled its way through the land or the genus Tourist helped to make dividends for shareholders.

Here, too, as in Muskoka, the Lake of Bays and all its sister tarns are embellished with islands of every conceivable outline. Dense woodlands clothe most of them to the water's edge, giving the effect of a hill-all-green resting on the dark brown waters, and when the white walls and red roof of a "cute" little cottage peek out from a sylvan cove, the picture is a perfect one because of its perfect settings.

Here, and hereabouts, the canoeist may revel in the song his paddle sings, as indeed in all this vast net work of waterways that checker-board northern Ontario. Once ensconced in the fragile little craft, a few turns of the paddle brings to the happy man in the stern the joy of the explorer, the thrill of seeing a wee bit of the world for the first time, of wondering what the next turn of the stream will reveal.

It also brings, and brings suddenly, a sense of remoteness that is in itself a pleasurable sensation. The world of men seems far away, though only a league or two. One has a little corner of the universe to himself, save for the wild life that is discovered when the canoe moves along as silently as the fish below its keel. Beaver dams abound, even though the husky little workmen, who disregard all laws of shorter hours, are as hard to see as the proverbial weasel is hard to catch. Plump water-side muskrats advertise their presence by a swift header into the stream, then little black nose just showing for a brief moment at rarer intervals. I've sometimes surprised a family of deer enjoying a quiet meal in a sheltered inlet, while the disturber marvelled at the quickness with which they could disappear in the thick underbrush hard-by. A leaping fish adds its sign of life as it stirs the mirroring surface into a thousand ripples. Myriads of insects share the upper air with the bird life, including a dignified crane, while flocks of ducks are frightened into a marathon race as

"There are many excellent golf courses overlooking the beautiful lakes in the Highlands of Ontario."

they easily outdistanced the paddlers. Farther along, a solitary old toad was overtaken in his swim to Toad Town.

Then comes the night, and of all

the hours of the twenty-four, none are so choice and rare as the twilight and camp-fire ones, when the traveller finds himself in just such a

necessitous condition as the beasts of the field, the birds of the air, and the fish of the hidden depths, bivouacking for the night in his tent. Never does a pailful of strong tea, a rasher of bacon, and a loaf of bread taste sweeter or go to the right spot more unerringly. Why is it that the odor of a bit of fat pork as it sings its frying tune in the old black-coated pan, feeds the sense of smell as deliciously as the meat satisfies the sense of hunger?

Why is it that the crackle of the log in the campfire makes such merry music when the day is putting on her nightcap and the darkness is filtering down between the trees and in the river valley? Why do the hour and the fire soften and humanize men, awakening happy memories of other campfires on other banks and in far-off other days?

When a wolf cry suddenly broke the silence, one started at the sound—not from any sense of ominous fear, but for the jar and discordancy of the haunting note, and when an answer was given by one of the guides, old Grey Wolf threw back a louder and nearer reply.

Then silence again. Lying on one's bed of boughs, how strangely quiet is the heart of the night—only a far-away, strange and eerie sound as if of stifled pain as two neighboring trees, stirred by a vagrant wind, rubbed branch against branch in helpless proximity.

It is the silence that keeps the camper awake most of the first night, as it becomes almost uncanny and oppressive. Silent, too, are the stars, hanging lower to earth than ever before, the Dipper almost touching the river. And the stars are so silent. The forested valley of the northland is "plumb full of hush to the brim," and all the world sleeps.

Northward and ever northward are other alluring worlds of woods and leagues of lakes. Such is the two million acre Algonquin Provincial Park, the Park-of-a-Thousand-Lakes, with reminders on every hand of Kat-

rine and Lomond, of Windermere and Derwentwater, of Killarney and Bantry Bay. It was a wise Government that set apart in perpetuity such a vast Crown domain not only as a forest, game and fish sanctuary but as a playground for all who wish. The conservation of a score of important water sources, through the conservation of the forests, is of no less importance.

What happy days Algonquin's noble park has afforded the lucky visitor to its haunts among the highest hills of the Highlands of Ontario; what happy memories are provided by the summer or autumn days spent within its wide-distanced boundaries.

Cache Lake is the main and one of the most accessible gateways to the Park, where the Highland Inn stands ready to dispense a brand of hotel hospitality that grades high, as the writer can truthfully testify. Here one can outfit for an exploratory trip through the Park, with a guide if desired, and if he be the guide who looked after this particular tenderfoot, he was philosopher, friend and companion in addition—one who had caught the spirit of the open and whose mind reflected the impress of the God-made country he had made his own. Under such expert guidance the dweller of a week or a month in a lakeland such as Algonquin Park is a lucky dog who need not exchange places with monarch or millionaire, whether he live like a King in the Highland Inn, or in Nominigan Camp, on Smoke Lake.

So Ontario is rich in her nature gardens, the glories of which have only been hinted at in this brief article. Not only has the half not been told, but a hundredth part of the half. The ordinary span of a generation is not long enough to discover all their secrets, but a day is a day, and a day or days, spent in any one of this trio of gardens, or better still, in all three, will mean their marking on the calendar of time as the reddest of red-letter days.

GEORGE GILBERT

(Continued from June Number)

CHAPTER VI.

MY father was a Lac à Jim trapper, French Canadian, descendant of a long line of voyageurs and trail men. While on a trip to Montreal with his catch of furs twenty-five years ago he met, wooed and married my mother, who then was a waitress in a restaurant where my father ate during that stay in the city. My mother was a McLeod, Agnes McLeod of Nova Scotia ancestry; my father Jean Carlac. My mother was tall, fair, with rosy cheeks; my father sturdy, dark, a merry man. I am named for my mother.

"Often I have heard my father tell how well my mother did her part after they were married, although before that she had lived in towns and cities. Yet we Canada folk have so much of the bush always before us or around us and hear so much of its life that it isn't a far step for a eastern Canadian town girl to go to the out-door life as you might think.

"After they were married my father gave up his long trapping trips.

He had a fine clearing at his place on Brulé Pond, and what with guiding, the plentiful fish, what could be raised on the good land, the game always to be had in season and the cows, pigs, chickens, my mother and father prospered. He was always in demand as a guide. In the winter he trapped nearby.

"So matters went, the two living happily, yet with one great wish—that a child might be born to them. But when I was born I brought sorrow, for within a year afterward, my mother, weakened by the illness caused by lack of treatment, died.

"My earliest recollection is that as a little girl, my father was my nurse, playmate, friend. Like all the Canadian guides, he was a good cook and knew how to keep our cabin home in order. I grew up with him, well nourished, perhaps not well disciplined, but much loved and well dressed, for he took good care to have ordered for me good clothing. Of his choicest furs he had made for me, as soon as I was old enough to get good from their use, beautiful fur gloves, hats, jackets, giving the work

out to the wives of habitants he knew. He gave up guiding and long trapping trips. I am sure he tried not to leave me alone much, but he had to go away sometimes, for supplies to town or for other reasons. The first few years he had "Huron John" La Cerf and his squaw, who were old friends of his, take up their lodge near our house and so when he wanted to go away, the old Indian woman could be with me. Afterwards he could take me to town and back and leave me in the cabin, when he was out about our clearing in weather when I could not be with him. Gradually I became able to go with him everywhere, even on his trapping trips nearby, and then to take part in the work of cooking and taking care of the home.

"My father never married again. Often I have seen him, on moonlight nights in summer, go to that part of the clearing where he had had put up a little white stone for my mother and there sit by her grave and smoke. Yet at such times if I crept up to him I did not find him sad. He would say to me:

" 'Agnes, your mother is just over beyond, with Le Bon Dieu and so when we go there, she will be able to speak for us.'

"I am sure that his rough and ready religion gave me much comfort. But once out there he said to me: 'If a man ever wronged you or struck you, I would kill him.' Then I shivered.

"One night, when I was about fifteen years old, he invited me to go out to my mother's grave, something he never before had done. Seeing that something serious was coming, I went, with wonder tugging at my heartstrings. It was summer.

" 'Agnes,' he said to me, 'so far I have tried to be both mother and father to you, but there is one thing I can not do. I promised your mother when she knew she was going away from us that in good time you, my daughter, should have learning from books. I can not give it to you and no one out here on the edges can do it as well as she would have

wished. So you must go to the nuns—'

"Ah, well, Mr. Aylesworth, I shall not bore you with the details of how I strove to convince him that I did not want to leave him, or of how he, with patient force and persistent renunciation, made me see that it was best for me. In the end I consented and a few weeks afterwards, riding on top of a load of furs from former seasons that he had saved out for the purpose, he took me in to Montreal, where the proceeds of the sale of the furs gave him enough money to make a nice deposit for me in a savings bank and to give me plenty of nice clothes and pay for my tuition with the White Nuns for the coming term. Then he left me, with the final admonition to improve my opportunities.

" 'As for me, petite,' he said. 'I must now go on the long trails again, that you may not lack fur money to make of you a lady fine, my golden demoiselle.'

"And now followed busy years for me. Summers I went back to our home beside Brulé Pond, to hear the loons call, the grouse drum, the woodcock whistle as they got up before one in the margins of the water breaks. And to catch trout and broil them for father who worked the little clearing farm during the open months. Then, fall near at hand, he would take me down, with his furs, see that I was well outfitted for the winter, deposit most of his money to my credit, hear the report of the Mother Superior on my progress, which, I am glad to say, was not bad, and then return to trap—to follow the long trails, *au large*.

"I had followed this course as best I could, hoping both to please my father and to do as my mother had planned for me to do, but with the idea that when my schooling was over I would be able to go back to my father's place and that he would then settle again beside Brulé Pond and we two go on, in the old sweet way.

"But, Mr. Aylesworth, who can read the designs of Providence? At the end of my fifth year, when I was

just past twenty, and had finished my studies, with some credit, and was looking forward to the coming of my father to take me home for good, the Mother Superior took me aside and told me that it was my father's further wish that I enter upon some employment in Montreal that summer, remain there and see if that would not please me better than life in the backwoods. He was not coming in to see me then, much as he wished to. If, after a summer of work in the city, I still desired to share his lonely life, he would not object further.

"It seemed a hard cross, but I saw that he was trying to do, with true delicacy of feeling, what he thought was best. I yielded again and as the nuns had found a place for me in a fashionable millinery establishment, as an apprentice, at a wage that met my expenses and as I had still a balance in the bank and could get more, at need, from my father, as the nuns assured me, I soon was at work, living with a distant cousin of my mother's, a spinster, who kept a modest *pension* in a quiet corner of the Old Town. Her name is Elizabeth McLeod.

"As the time drew near when my father could come to see me, I found myself more and more inclined to return with him. I made good progress in my apprenticeship, and often thought I should like to complete my course, but the call of the open places was too strong for me to resist it.

"Then came the blow. To keep up my French, I had taken *La Patrie*; also because in it one can find news of the habitants and their little doings. Opening my copy of it one day after work, I found staring me in the face an account of a fight between two men near Brule pond over the ownership of a magnificent skin of a black fox, marked with a pure white cross on its forehead. Each claimed to have taken the fox in his trap. One, Pierre Lafitte, had been struck down by the other, Jean Carlac and left for dead. Carlac, taking the skin had fled to the wilderness. Officers were after him. Lafitte had been

taken to a St. Johns hospital, with small chances of recovery.

"For days I went about like one dumb with pain. That my father should be so in peril was a cross hard to bear. But I hoped Lafitte would recover and pursuit would slacken, and it would pass off as a trappers' quarrel. If death does not result often the law is mild in such cases. I knew this Lafitte well—a skulking, sneaking fellow, called 'Jean Reynard' or 'Johnny Fox,' as you would say or—"

"Johnny Sneakum," he suggested dryly.

She nodded approval, a light of mischief dancing in her eyes.

"I know all such," he said shortly, between big puffs.

"My aunt told me to wait a few days and see what turned up. My first impulse was to go back to Brulé Pond, but I restrained myself when my aunt said that if I did and my father heard of it he surely would come back to me and that thus I would be for him merely bait in the trap and that the officers would watch the cabin and take him easily when he came to see me.

"It was well that I heeded her advice, for one evening, when I returned from work, tired out with meeting the inquiring glances of shop companions who had heard of my father's trouble or had read of it and had tried to get me to talk, discouraged and yearning for someone to talk to who would understand me, my aunt told me that I was wanted in her parlor and there I found Huron John, the Indian friend of my babyhood. He was alone, dressed soberly, as our Canadian Indians do for trips to a big city. One glance at him was enough to tell me that he wanted to see me alone. Despite my aunt's hints to the contrary, I asked John to my room, where he gravely drew from under his coat one of the most beautiful fox skins I ever have seen—black, prime. Its forehead was starred in white!

"It was the one my father and Lafitte had quarreled over, he told me. He had sheltered my father

three days at the head of Brulé Pond when he was supposed to be speeding for the wilds of upper Canada. He had left with John the black fox skin, which was to be sent to me, with money, and as news had come to John that Lafitte was then at the point of death, my father had left for the wilderness, telling Indian John that he never would put himself near me, as I was 'a lady now, a golden demoiselle.' And he was just a rough trapper, with a crime charged against him. That day John had heard Lafitte was much better.

"After Indian John had gone, with my thanks and promise that, if needed he could call me back to Brulé Pond to meet my father at any time, I considered my situation. I feared first that Indian John had been watched and the officials notified of his coming. Up Brulé way he was well-known as my father's friend. By leaving for Montreal when he should have been going to lay his traps for the winter, he would be suspected of carrying me word from my father. So it was just in time that I concealed the skin of the black fox, for soon an agent of the police came, but had no satisfaction from me. He told me the police had planned to take Huron John as he came from my boarding place, but had been outwitted by the Indian who had escaped. That made me more at ease, as Indian John would be able to take back to Brulé Pond the news that Lafitte had passed the danger point and would recover. That news would be worth much to my father, I was sure.

CHAPTER VII.

"Imagine now, Mr. Aylesworth, my position," she went on. I held a fortune in the pelt of the black fox. But it was my father's and if he were taken, the money from it might hire a lawyer to defend, perhaps free, him. Or if he got away and needed help in illness or if injured the money from the skin could be sent him by friends over the long trails. In his condition money might be needed more than anything else. Yet I dared not sell the skin, as to

offer it in the Montreal market then would attract attention. Black fox skins are not as plentiful as blueberries in August. And on mine the white cross on the head would identify it, you understand?"

Aylesworth nodded. A pleasant warmth from the sheet iron stove had pervaded the cabin. Snoozer was snoring comfortably. Outside the wind came and went fitfully.

"About this time Frank DuPointe came into my life. He came to Aunt Elizabeth's *pension*; at first no different to me than were the other young men who came and went. But he paid especial attention to me, winning first interest, then friendship. He said he was a man of some means, had hunted, fished, trapped. His conversation often turned on the long trails. I could see he was a good amateur woodsman. He made light of my father's offense.

"This taste of his for the outer spaces appealed to me wonderfully, after long months in town, where I had no one to talk to who could understand me, as he seemed to, with his apparent ready sympathy for my wilding whimsies.

"Well, Mr. Aylesworth, soon DuPointe was escorting me to work and took me out evenings. He was of good appearance, dark, not over-stout in build, agile, strong, well educated, with a fascinating fund of small-talk, such as a girl likes to hear who has not had a large experience with men. To me he seemed the Prince Charming fated to come into my life and I made it not hard for him to make love to me. At the end of the month I permitted him to announce our engagement. My aunt, glad, no doubt, to have a troublesome girl well married off her hands and not knowing about the pelt of the black fox, did not demur. I hadn't told DuPointe about the skin.

"My plan was that after I was married to DuPointe, I should tell him all about myself and my father—our peculiarly tender relations—and so appeal to all the good in a man's nature and then that he, loving me and with good knowledge of the world,

"A pleasant warmth from the sheet iron stove pervaded the cabin."

its ways and the fur market, would sell the skin for me and show me how to keep the money from it invested safely, so I could have it ready, should my father call on me for aid.

"But I planned, like many another woman, without knowing what sort of man I had married. For after we came from the church to my Aunt Elizabeth's house, from which place we were to go on our wedding trip among the Thousand Islands and up the lake and so to Niagara Falls and perhaps beyond, as I thought, I found a stranger waiting for my husband. He drew DuPointe aside and I saw them whisper. My husband was denying something most vehemently. Thinking perhaps there was some question of money due and wishing to relieve my husband of embarrassment, I went quietly into the hall and said, as if I were talking to my aunt:—"Yes, aunt, I'm coming." Then I stepped into her room, where she was not, as she was below, packing our luncheon for the trip's first day. But the two men must have thought that I was gone, for they came out into the hall and their voices became louder and louder.

Piecing this and that remark together, I learned that Frank DuPointe had been put up to wooing me by the other man, a maker of shady deals in stolen furs. He had in some way found that I was the daughter of Jean Carlac and heard from a police friend about Huron John's visit to me and figured that I had the precious skin, therefore.

"I heard my husband say:—"She's not told me where it is yet. But when she's been mine a week she must tell or I'll beat it out of her with a club."

"My heart seemed frozen for a moment. My brain reeled. Then I was Jean Carlac's daughter—a child of the long trails—once more, brain clear, nerves steady. My things were all packed. In a grip I had placed all the immediate necessities a woman needs to travel with. I had my own store of money. My decision was soon made. A revulsion of feeling against my husband swept over me. A yearning for the wild, open spaces, the clean-hearted people of the long trails, came to me. Without a word, I stepped into my room, drew the pelt of the black fox

from its place of concealment, put it into the grip and went out down a side hall, so thence to the front of the house, and into the taxi we had waiting. No one saw me go, I said to the driver:—

“To the Canadian Pacific, at once. You are then to come back after my husband, who wishes me to go first, that there may be room for an extra trunk.”

“I paid him in advance and he, nothing doubting, obeyed me.

“But my trip to that station was but a ruse, as I had made up my mind to cross the border and go down into New York. That I did and spent the following winter in Albany working, under the name of Agnes McLeod, as a milliner. My taste and skill served me well and I did well. But with the spring came the old yearning for the open spaces and early this year I determined to quit the city. This plan was hastened because I had a letter from my aunt, to whom I had foolishly written too soon, giving her my reasons for leaving as I did. In reply she wrote to me that DuPointe, who meanwhile had remained with her, playing the part of the injured husband, had seen my letter, recognized the postmark, and my handwriting, had seized the missive and read it. She had turned him unceremoniously out of the house and he had gone away, swearing to follow me. Later she had seen him and he was raging drunk.

“Did he?” asked Aylesworth, “follow you to Albany?”

“Yes, but I did not know it then. But the letter from my aunt alarmed me and spurred me on to do two things.

“First, I placed the black fox skin in a fur storage house and sewed the receipt for it into the lining of a piece of my clothing.

“Second, I left the millinery shop and answered an advertisement calling for a young woman to go to the Adirondacks for the summer as companion to an invalid. I secured the place and went, with a wealthy Troy woman, Mrs. Stethrohwe, to her camp, over on Fulton Chain.

“But before I left I had another

letter from my aunt, telling me that Huron John La Cerf, in for his spring trading trip, had been to see her and that John had heard from a trapper in the far north that my father was alive and well and that she had sent my father word by John as to my affairs. As I read that part of her letter, I seemed to hear my father say again, as he had to me beside my mother's grave:— ‘If ever a man wronged you or struck you, I would kill him.’ I could not help but shiver again at the memory of his earnestness as he had said that. I hoped he never would meet Frank DuPointe to know him as the man who had threatened to club me into giving up the precious pelt of the black fox.

“I wrote back to my aunt, telling her where I was bound—and why.

“With Mrs. Stethrohwe at Fulton Chain I had a pleasant situation. I read to her, attended to her correspondence. As the summer drew on I became almost contented, although I worried about my father often.

“But one evening when I had been released from my duties and was waiting on the boat pier watching the canoes and motor launches glide back and forth and listening to the laughter and badinage of the young people, some one stepped up behind me and without ‘by your leave’ sat down beside me. It was my husband! He had traced me from Albany!

“He was humble, cunning. He owned to taking my letter from my aunt and that he knew why I had fled. He blamed the dishonest fur dealer for tempting him into a course that threatened to wrong me and pleaded for my forgiveness. Foolishly, for he seemed to be sober, penitent, I went to my room and got for him half my store of money. He begged me to tell him where the pelt of the black fox was. Fortunately I refused. He thanked me for my money and went away. No love for him remained in my heart. All that I asked of him was to let me alone.

“But he came, again and again. Each time his demands on me increased. Once he came drunk and

boasted he had sent word to my father by a friend in Montreal who knew the long trails, that he had married me and meant to have the black fox skin from me by force and had already taught me, with a club, to obey him. There was a scene that upset Mrs. Stethrohwe. I felt that under the circumstances, I was more of a burden to her than a help and so I resigned and hearing of a place to be had as waitress in a summer camp farther into the woods, I went there. I wrote my aunt of my new plans.

"I felt elated after a time to find that my husband did not follow right on after me. I did not try to make a secret of my new destination or in any way to close up the trail against him. I even had a half wild idea then at times that if he should follow me into the deeper wilds, sober up and show signs of good behavior, I might take him and try to influence him to adopt a cleaner course of life. After all he was my husband and we French Canadian girls wed for life—for better or for worse, Mr. Aylesworth."

She paused. John nodded, saying: "I know you Canuck lassies stick to a man like cockle burrs."

He laughed and she with him. Then she went on:—

"But DuPointe did not come—then. It was after the summer folks had gone and the deer hunters came to the camp where I was that my real plan took shape. After our big Saguenay wilds, your tame little Adirondacks seemed small to me. I was not afraid to face a winter up here, as my father and mothers for generations back had faced our big, stark winters, out in the open. A letter to my aunt told her of my new plans. I sent it early, inviting my father to join me. An answer came, saying Indian John had been in and taken my word out for me again.

"As camping parties came and went, I managed it so that I had the giving out of supplies and took in the money for them and receipted for them. So when I began to get my winter supplies ready out of the camp's big store, I had no trouble in concealing

everything I wanted under the floor of my room, putting them in crocks and cans, so the porkies could not get at them. I picked up here and there from the people of the camp spare articles of clothing and from a foolish woman who had come up to hunt, dressed in a stylish fur hunting costume, I got this pretty fox jacket and cap, in return for services I did for her. So, when the camp broke up, I was prepared and in the confusion of getting the big party away at the station, about ten miles out by a woods road from the camp, I was not missed when I dodged into the brush by the trackside and so had no trouble in getting back to the camp again before dark. That night I slept there alone, almost happy at the thought that my troubles were all behind me.

"In the morning I packed my duffle among which was this little rifle that had been left behind by some one, with cartridges, on a traverse I made of birch poles and was ready to start back toward what I had been told was Netagomish. Just as I was ready to leave, some one came staggering up the trail.

"It was my husband, drunk, abusive. He had gotten off the train at the stopping place for that camp, having been told I was there. He had hoped to find many people there and a new opportunity for blackmail. Instead he found me, my mind made up ready to defend myself, careless of results, now that we were alone. I soon made it plain to him that he could not intimidate me there, with no one near to hear his accusations against my poor father. I left him sitting on the porch of one of the camp houses, took the tug rope of the traverse, made off through the quiet woods. I was careless whether or not I made a trail. He stormed off, saying: 'I'll get you by way of Stratho.'

"I had heard there were guides' cabins over on this side of the range and one of them I planned to use. It took me three days to come over and once here I found this cabin. It had several steel traps in it, left by some one. I began to set snares

and with my little gun and ax and this stove I felt that I could be comfortable until spring. I had food enough, with what I could kill with the gun. I knew my aunt had gotten word to my father of my plans and that he would come, in time.

"But again I was self-deceived. The day I met you—yesterday—I had no thoughts but that I was safe from pursuit. Yet my husband, after I had left him, had gone back to the railroad and up it to Stratho. He had an idea of how the land lay up here. He had hung around Stratho, making shrewd inquiries, and using the name of Paul Perrault. Then it was that he, after finding that I had not come through that way, had found out about the guide's cabins here and concluded that I had headed this way. He suspected that I was preparing a place for my father to come to. That much and the fact that he was known at Stratho as 'Paul Perrault' he blurted out when he first found me, after you had left me yesterday. He reached this cabin after I had left to go down the creek, after my traps. He had seen us meet. He suspected me of receiving attentions from you and accused me—you know the rest. Except that—"

Here she paused, hesitant.

"Go on," urged Aylesworth, deeply sympathetic.

"Before he came down along the creek after me he stayed here at this cabin long enough to put all my food into a few boxes out back of the cabin and burn it. My cartridges he took. Also my little store of money, which he found while searching for the black fox's skin, which he thought I had here. His object probably was to overcome me, and then, by showing me we were out of food, compel me to go back with him, live with him as his wife and that then when he had me cowed, he would force the knowledge of the precious pelt from me. At any rate, owing to his actions, here we are without food—"

"You seemed to have enough for supper—"

"That was all I had left of what I rescued from the fire."

"How did you suspect he was up

there on the hill in that lean-to, where you found me?"

"I have good eyes. After you left, I saw him, afar, staggering along the ridge and once or twice lean against trees up there. After I was home last night it came to me that he must be wounded and I knew that if he was, being a good woodsman, he would make him a lean-to, if he found he could not get out of the woods before night and would dress his wound. "I wanted to be sure he was gone."

Aylesworth thought a moment, then said:—

"As for food, there's plenty down to my cabin. And we can get game enough there, till I can get out. And from there you could snow shoe down to the Stratho road and get help if I couldn't make it."

"That is for tomorrow's consideration," she said. "For the present, the big problem for you is—rest."

"And for you?"

"The same. Let me fix you a snug blanket roll on the floor and I'll sleep on the bunk. Snoozer can watch."

"No one will get near without an alarm from him. Cock the little meat gun and put it under your balsam pillow."

"One thing puzzles me," she said, "and that is when he accused me of receiving attentions from you, he used your name. How did he get it?"

"Oh, everyone in Stratho knew I was on the Nescopern for the winter. As he must have seen me go south after we parted yesterday, he probably concluded I was the trapper he had heard of in here."

CHAPTER VIII.

Quartering the Nescopern Highland northwesterly from Muskrat Glade toward Stratho, Frank Du-Pointe limped bitterly forward. Forced to lose time by going around windfalls and great heaps of rock piled up here and there like Titans' playthings, he nevertheless kept his general direction with the aid of his compass. He had left the lean-to that Aylesworth had found early that morning. The soreness from

the bullet wound in his leg was intense, but he managed to push himself along. A blind, unreasoning rage against his wife filled his mind and heart. Afar he had seen her in converse with a stranger—a handsome trapper. The same man had come to help her when he had attacked her. Although he did not love his wife, a feeling that he had been wronged had taken possession of him. The drink had faded out of him, but not the desire to finger the pelt of the black fox with the white cross on its forehead and afterward the gold pieces that the pelt would bring.

At noon he made a hasty lunch and then found a good stick with a fork in it, that served him as a crutch. With this he made far better progress. So it was that he came, bit by bit, from the Nescopern levels to the floor of the valley of Rainbow River at dusk and struck the riverside woods road at the point five miles south of Stratho, where a woods road and a branch of the State's macadam forked. There was little snow in the valley of the Rainbow by now.

Far up the macadam an auto horn blared as the headlights brought into view of the people in it the sign post pointing to the woods road. DuPointe saw the motor pause and a man was dropped from it. He heard the clank of iron. The automobile went on, leaving the lone man at the roadside. Another and another and still another automobile passed, one of them very large, like a goods van.

DuPointe approached the man who stood thus at the roadside in the dusk. He saw a man in the high waterproof shoes, the heavy knit overstockings, the belted-in wool trail coat, the downpulled, long-tasseled cap of the trapper. In his belt was the ax and hunting knife. In the crook of one arm was his rifle. Over his back was slung a few dozen small traps and one very large one—for bear.

DuPointe had seen so many trappers in to trade at Montreal that he knew this one for what he was—a man of the long trails, one who could travel *au large* by canoe on

open lakes or make the small trails serve him, at need. As he approached slowly, he studied the man keenly. He noted the man's breadth of shoulder, his quick easy movements when he wheeled at the sound of another approaching him.

"Bon jour, monsieur," the stranger greeted in booming accents. His face was pleasant, open, his eye had in it a merry glint that came out from under the cloud of concern on his brows. Yet no sooner had the greeting passed his lips than the grave look returned.

"Bon jour, monsieur," DuPointe returned.

"Are you by chance of Canada?" This in French of the habitant.

"Of Montreal."

"Is Stratho near?"

"It should be five miles. I am going in, after an accident with a gun in the woods. I have left my friends at their camp. In order not to spoil their sport I told them I would limp in on my crutch and go home. I foolishly shot myself with a small rifle while cleaning it."

"Accept my condolences, monsieur. Would the touch of my shoulder to stay you on the way in help you?"

"Then you are bound for Stratho?"

"As much as for anywhere in these small wilds, monsieur. I am here to pick out a place to trap for the winter. I came down with the big automobile party from beyond Montreal. As they had moose heads and caribou and skins and were afraid they would spoil enroute, they had me travel in the big machine and I worked over them enroute. The pay was fabulous for a poor trapper and so I brought my traps thinking I would stay in these parts for this winter, instead of going on the long trails."

"No; I can manage to get along alone well enough," answering the other's former inquiry.

While the stranger rolled a load for his black brier pipe out between his palms; DuPointe studied him in the growing dusk as well as he could.

"Did you, by any chance, in this country where you have been in

camp, monsieur," asked the big trapper "hear of a man and his wife named DuPointe, new arrivals in this country?"

Not a shade of uneasiness, not a start of surprise, did DuPointe show. He felt sure he had the clue to the other's identity now.

"I heard of two such," he said, "from our guides. Let me see," bowing his head, as if in thought.

The other regarded him keenly.

"Oh, yes," with an accent of decision. "It was like this. I came up Rainbow trail. Over back from here is what the people here call the Nescopern Highland," waving his hand toward the barrier at their right. "Beyond that is another valley and in that, near its head some cabins the guides of this country have put up. It was in one of them that our men saw this couple. Are you looking for them?"

"Yes, monsieur. Were they well when you heard of them?"

"I paid little attention to what was said, as it did not interest me, except that the guides did say that the husband was of an ugly disposition and often misused the wife—"

The rifle under the stranger's arm trembled; the traps over his back shook as he made a motion threatening and odd. But his voice was level as he asked:—

"And this husband, what is he like?"

"A strong man, above the medium height, thick, not slim, as I am. His hair is dark, his cheeks fresh in color. With them they have a red-brown dog. The man's gaze is direct and open. The guides were surprised when they saw him beating his wife—"

"Beating her?"

The black pipe was going now, full speed. The stranger half turned away.

"Then you are not going to Stratho, monsieur?" DuPointe asked.

"No monsieur. I have changed my mind. This country seems a good country for the *trapping of the bear*. I have salt, coffee, matches in my clothes. I shall turn aside here to see how the country lays before I make up my mind where to settle

in this region. The trapper of the long trails needs little. I am obliged for your information, monsieur. It is pleasant when in a strange land to meet a compatriot. As for these DuPointes if they have their affairs of family, it is better that I keep away from them. They are friends of old friends, no more. Why should I intrude upon them? No; I shall trap the bear. The Madame DuPointe I have seen; her husband I have not. But I have heard of him—too much, too much."

"Yes, he seems a beast. Well, monsieur, such are certain men. They woo a girl softly, but as a wife they treat her harshly. But forgive me for this gossip. If you are in Stratho during my stay, ask at the Eagle Hotel for Paul Perrault. Or if I need but small attention from the doctor, I may go back to my friends on the lower Rainbow."

The younger man turned, limped off up the Stratho road slowly, with more of an appearance of labor than his condition warranted. A few steps only he made before a rattle of traps being shouldered told him that the other was ready to depart.

"One thing more," he called through the darkness. "The husband of the Madame DuPointe at first tried to use the name of Aylesworth, but the guides would not listen to that, as there is a John Aylesworth hereabouts, a good fellow enough. Finally he owned that his name is DuPointe. His cabin is over in the next valley, and it sits under three pines."

"Again I thank you," came the booming reply. "Your information is very precise."

This time DuPointe crutched it steadily away. As he went he heard the traps rattle again; heard the ring of hobnails on the road-metal. Then the footsteps of the stranger ceased. He had gone off down the soft woods road.

DuPointe crouched at the macadam roadside and listened long and intently.

"He goes to trap the bear, eh?" DuPointe sneered to himself. "The

bear? Lucky for me he did not know me and that I could turn him so neatly against *her* new-found friend out there—"shaking his fist toward the Nescopern.

"Well," he said, preparing to go on; "let him do as he pleases. It will be strange if out of it something does not come to give me some advantage. Lucky I knew his name, as by giving him Aylesworth's name as a clue, I have clinched the seeming proof against him. When they meet, Carlac will act first, investigate afterward—too late."

Getting up, he went toward Stratho. He found the Eagle's bar room thronged with its usual crowd. Snow was falling again thickly.

Mine Host Johnson of the Eagle greeted him heartily and listened with interest to his story of having gone into the woods a few days with friends, there to meet a slight accident. Such events are not unusual, so his request for the services of a doctor created no comment. His wound dressed, supper eaten, DuPointe excused himself and went to bed, to revolve in his mind his plans for securing two objects that he held foremost in his mind—the black fox's pelt and satisfaction for the treatment his wife had given him.

CHAPTER IX.

As for the man to whom DuPointe had talked on the Stratho road, he, after going down the woods road in the dark for a time and then withdrawing to the roadside for shelter, found that the storm promised to be of great force. So with the skill of the trapper of the long trails, he made him a lean-to of pine boughs and spent the night in the open.

At dawn on Wednesday the big Canadian trapper came out of his frail but efficient shelter to view a world overspread with a blanket of snow at least two feet deep. Yet off the levels and especially on the slopes where he was, it was not so deep. The air was not cold—just right for snow and more and more snow.

Shaking himself inside his clothing as a bear shakes his body inside his

loose skin, the trapper, after snatching at a few mouthfuls of cold food that he had with him, threw his rifle into the crook of his right arm, his traps over his back and began the ascent. Half a mile farther on he hid all the small traps, but he kept the huge bear trap.

"This one for the human bear that beats my Agnes—uses her like an Indian uses his squaw," he growled, throwing the big trap over his shoulder. Soon he was far above the Rainbow's valley and with the storm at his back, came to the summit of the highland and went over it and then he began to stride across the more level land up there, around rocks and windfalls, holding the wind at his back to keep his direction straight. Before noon he was travelling in a soft, clinging snow up to his knees, but it did not seem to bother him. The snow was not heavy and often there were places between the rocks and windfalls and in under hemlock clumps that there was little or no snow.

It was snowing harder still when the lonely man felt the ground falling away before him and found that every step was taking him to a lower level than the one before. He was across the highland then and going down into the valley.

With the true woodsman's instinct he knew that such cabins as guides would put up there would be along any watercourse at the valley's bottom. So he held on until he was in the most depressed portion of the dip between the hills and when he struck the water, followed it down. The little stream was still trying to talk, although here and there its tiny reaches were frozen over.

It was growing dark when the trapper, his rifle at "ready" came around a bend in the tiny stream and so on to the cabin. The three big pines, protectingly over it, marked it as the one he sought.

Like a lynx, Jean Carlac sank into the hollow between some logs and watched. The snow came, drifting over him. The wind moaned through the watching pines. The dusk came, but no light to make

cheerful the tiny window at the cabin's end. No smoke ascended from the smoke pipe at the other end.

Finally the grim watcher got up, left the bear trap under the logs, threw his rifle forward, drew up the hammer and, with finger on trigger, went carefully ahead.

At the door he paused, irresolute. Suddenly he knocked. He had no answer. Again his knuckles gave summons. No answer. He wrenched the door open and, gun poised, went in.

Inside the gloom baffled him for the moment, but his forest-trained eyes soon came at the heart of the puzzle. The cabin was deserted. The stove was stone cold. He found a candle stump in a bottle-end and with that to light him, soon found that there was no food there. The bunk was without a blanket. Cooking utensils were in evidence, all empty.

"They were out of food," he muttered, "and had to leave. And the snow will hide their tracks. I must wait until tomorrow when in the light, I may get down to the old snow and so pick up their trail here and

there. There is no other way." He sighed, and set about preparing the last of his scanty store of food.

His meal eaten, he first warmed the cabin by making the sheet iron stove red hot. Then, stretching himself all dressed on the hard bunk, he was soon deep in an uneasy, restless slumber that held him thrall until the dawn came to awaken him and to show him by its shifting lights and shadows that he was snow bound until such time as the snow settled after a long thaw or crusted after a sleet storm. Yet he did not worry about himself. After the great hazards of the long trails, the risks of the tame New York wilderness seemed too small, for the descendant of many generations of voyageurs, to consider.

CHAPTER X.

"Wal, Mr. Peerow," Proprietor Abner Johnson ventured as DuPointe came out of the Eagle's dining room after breakfast the next morning, "I guess you're in for a spell of it here?" Take some time to break out the roads and trails."

Johnson's pronounced Adirondack Yankee twang as he mouthed "Mr. Perrault," the name DuPointe had signed before to the Eagle's register, conveyed to the few men about the place the information that this was the stranger who had been injured while hunting, and had had to come in to have his wound dressed. This in itself was enough to make Perrault the center of attraction in the small mountain town that was being shut in closer and closer as the snow piled itself up soundlessly outside. Already the flakes had fallen to a depth of twenty inches on the level and with the earlier snows, the total fall was over three feet, as in Stratho the warmer weather of the day before had not been so pronounced as it had farther down on the Nescopern.

"There are worse places than the Eagle to be snowed up in, I'll be bound," DuPointe said, drawing up a chair to the cheerful round woodstove in the open space in front of the bar.

"Putty fair here; putty fair. As

to grub, we ain't much on style, but good on quality and quantity," Johnson rejoined.

"Any more of that real good whiskey that we had last night?"

"Some could be found, I reckon," with a chuckle, which went around the group of sitters and chewers. "No excise men liable to be gumshoe-in' and snowshoein' about to-day to see if the dry law is enforced."

This terrific joke was received with a loud burst of merriment.

"Well, then, let us all see about it," invited DuPointe.

This sweeping invitation put the visitor at once well in the good graces of the crowd. Especially as he insisted that after the first drink another and another, be taken, at his expense. When in Stratho before DuPointe had been liberal.

All the time the drinking was going on, DuPointe kept searching the faces of the others. In none of them did he find the combination of greed, cunning and resolution that he sought. Two, Alonson Barker, a small, mean faced man of fifty, a hostler about the hotel, and Brite Wagner, a big, loutish farmer who had come in to Stratho with a load of potatoes and been snowed in, to his own intense delight at the enforced stay away from his home on the flats below, where he was so often alone for weeks at a time, being a bachelor;

(The concluding chapters of "The Bear of Silver Dale" will appear in August issue.)

"Like a lynx, Jean Carlac sank into a hollow between some logs and watched."

interested him most. But neither one had the chief quality of recklessness that DuPointe thought he needed. But he so managed it that by the middle of the morning he had made friends with the two and drawn them up to his room, where, over a private bottle, he clenched their good opinion of him by noon.

The Albino Bass of the Ottawa

S. H. HOWARD

THE current of the Ottawa, disorganized after its release from hard-driven gallop down the Rapides Des Chenes, eddies and back-washes for half a mile below, staggering dizzily awhile, as it were, and taking a few minutes to establish itself on its new level.

For some thirty miles above the rapids it has travelled along steadily and slowly, practically at water level all the way. At the foot of the broad but shallow Lac des Chenes,

however, it is whipped over a limestone slope, down which it rushes white with lather, pell mell into the deep channel of the river below.

In these eddies and backwaters, with the pervasive roar of the tumult of white horses in our ears, we had fished with live minnows for bass and pickerel and perhaps a pike. I say "perhaps" because it was all that way—we were fishing for what we might "perhaps" get. But the two-pound bass and a small pickerel

formed the sum total of our catch so far that afternoon. With ideal water for the propagating of the best of Canadian game fish, there are nowadays more fishermen than fish in that broad, deep, moving water. The sawdust and the waste of the great lumber industry of the Ottawa has greatly affected the natural conditions which of old made that great river an ideal fish habitat. The lumber mills are burning their sawdust now and with time and care these old fishing grounds may be restored. When that time comes the people of Canada's capital will have ideal bass water right at their door.

The sun was blazing red behind the pines on Point Des Chenes on the Quebec side when we sent the canoe down with the current towards the cottage on the Ontario shore where supper somewhat impatiently awaited us. As we neared the gap in the boom which lets small craft through while still guarding against the escape of the floating logs, which all summer long go drifting down the Ottawa, the afternoon breeze had died away for the interval between daylight and dark, when the river flies come out to play. Over the face of the river had come a velvet softness flushed with variegated color. The great black boom timbers spilled the limpid flow of their sides with a smooth glissade which eddied softly at the end of each chained log. Tints of lilac, orange, purple and opal glowed iridescently on the transparency of the soft, moving water. Above, in the pale evening blue, swallows swooped and circled, feeding on the myriad tiny winged things which had come forth from the shelter of the land to live the climax of their day.

Thousands of the little white moths and river flies, failing to distinguish between air and water in the illusion of reflections and transparencies, struck the surface, and with wings wet and heavy, could only flutter helplessly on that uncertain line which divided the sky above from the sky below.

We swung the nose of the canoe to point for the water gateway in the boom. At that moment a slight

rumple lifted the floor of the glinting water a few feet ahead of us and sent a series of opalescent rings spreading through the gold and the purple.

"Fish!" exclaimed Samson, in the bow. He spoke in a reverent undertone which one uses when a big one is sighted. "Only an inch from the top."

The canoe drifted slowly over the spot where the rumple had flattened and faded, we gazing earnestly, with motionless paddles, the while.

"There he is," exclaimed Samson suddenly, and still his tone of reverence. He pointed to starboard with his paddle. "And by gosh! There's another."

"And there's another on the other side," I added, "and here's one just astern."

"We stopped the way of the canoe and looked about us, wild-eyed. Fish, big fish, and right on the surface were not such common sights on the surface of the old Ottawa nowadays as to leave a fisherman quite calm. In front of us a little bay in the boom formed by the grip of a boom anchor holding against the pull of the current, changed the color of the water to a velvet brown. In this angle little waves were starting up here and there and water rings were circling.

"They're feeding on the flies," whispered Samson. "It's a whole school of bass! Look!"

He pointed tensely to a black fin twenty feet from the boat, and while we looked a big fish also broke the surface. They were all around us, a school, a veritable school, feeding on top!

"By gosh!" ejaculated Samson fervently. "There are some fish left in the Ottawa yet. Eh, what?"

He laid down his paddle and picked up his rod. It was baited with a dead minnow.

Gently he cast into the centre of the nearest water ring, while I pointed the canoe and held her steady.

The minnow fell with a tiny splash true to the centre of the target, Samson slowly trolled it an inch below the surface. Breathless, I

knelt at the stern, waiting for that fierce, wicked strike which a black bass makes when he is feeding near the surface.

But nothing happened. Samson flicked out his line and cast again, with like lack of result. Then this fish—or another—rose again just off the port bow. We could see the dorsal fin and half the tail clear of the water.

"I'll bet he weighs every ounce of three pounds," whispered Samson in awe.

He cast his minnow three feet in front of the fish's nose. The big find continued in plain view but there was no movement until Samson trolled the minnow almost into its face. Then it turned aside and dived.

"That's no bass," declared Samson in a tone of conviction mixed with disgust.

"What in blazes is it, then?" I demanded.

"Darned if I know. But if he was a bass, I know darned well he wouldn't have turned up his nose at a minnow."

"Let me have that rod," I demanding laying down the paddle.

Samson reeled in and passed me the butt. I removed the dead minnow from the hook. A grasshopper had jumped into the canoe while we were up at the Island, and had ridden with us half the afternoon. He had but that moment hopped trustfully into my lap. I caught him with a swift treacherous slap and in another moment, hooked under the wings, he was dangling from the end of a springy steel rod.

I cast as for a trout. The grasshopper fell gently into the centre of a circling ripple abreast of the canoe. He kicked a little, then the weight of the wet line drew him under. I raised the tip of the rod and drew him gently towards the boat. I was reeling in for another cast when there came a slight jerk—the unmistakable strike of a fish. I struck back hard as for a bass and the bare hook came trailing in towards me, on a limp loose line.

"Curses!" said I. "We have no more grasshoppers."

"Yes, we have," returned Samson. "I just picked one out of the river. That's what these fish are here for. Pass me that rod."

He cast. A moment later his line was diving down at a sharp angle.

For a half a minute we were sure he was a bass. The bowed rod swung from side to side. Then it straightened, and the fish jumped six inches out of the water, and dived again, while we both uttered profane ejaculations of astonishment. The fish was gleaming white.

"That's the funniest black bass I ever saw," declared Samson.

"Maybe he's an albino," I suggested.

Whatever he was he fought well for two or three minutes more and then Samson reeled in and swung him towards me in the stern. I grasped the line at the water's edge and lifted the fish over the side.

"By Godfrey," exclaimed Samson, "it's a white fish."

And so he was.

All around us a school of white fish were rising and we had no more grasshoppers. It was the one chance of the year, the short period of a few days when the whitefish schools of the Ottawa come to the surface to feed on the white moths and the grasshoppers which fall into the river and go drifting down the current.

We caught little moths which fell into the water close beside us, but their bodies proved too soft. The snap of the cast or the pull of the water stripped the hook.

Twilight deepened, and the fish departed. Reluctantly we paddled home.

"That's the way with whitefish in the river, here," said the old Ottawa raftsmen, busy skinning catfish at the canoe landing. "They travel in schools. There's about one week in the summer when they'll come to the top of nice calm evenings just after sunset. Then you can catch them with grasshoppers. I've seen sports catching them with these here bass flies. They'll take a worm, too, sometimes. But to-morrow night you might go out there and never

see one. Some summers they never strike in on this side at all. There used to be a lot of whitefish caught off that point and I guess there's quite a few in the river yet. But the people along the shore here used to net them after dark, and they got thinned out. There's quite a few of them up above in Lac des Chenes.

Their mouths are soft and underhung. You want to use a medium-sized hook and be easy with them."

And so it proved. Some dozen or more were caught during the next few evenings and then they disappeared. Channel cat and mud pout continued as the great staples of the Ottawa.

A Hunter's Experiences in Alberta

Editor, Rod and Gun:

The date on the wrapper of my copy reminds me that another year's subscription is due. I have certainly enjoyed the reading very much. I have had some good shooting and fishing since February 1918, having fished in the Bow and Elbow rivers west of Calgary. Trout were very scarce but grayling were in abundance. I found plenty of Wilson snipe and woodcock in and about Springbank, and some chicken and plenty of duck in the Peace River country which we found was being settled up very fast. The big game is getting farther away in some

localities. We found plenty of bear at a place called Grizzly Bear where we stopped for a week. The young man with whom we stayed always carried his .22 Winchester to the field with him. One day a yearling bear came into the field and the dog saw him and chased him to a small tree. The young man killed the bear with the .22 long. I was not looking for trouble with grizzlies as I only carried a .35 automatic Winchester which I find a good general purpose gun. We found plenty of grouse and duck and had a good trip.

Map of Blue Sea Lake Region

See "A Trip up the "Gatineau," commencing on next page.

A Trip up the Gatineau

GEO. B. LOVEDAY

WE read stories in the sporting magazines of fishing and hunting trips in Alaska, the Rockies, Nova Scotia, New Brunswick, Maine, the Adirondacks, even Florida and many other places but that section of Quebec Province immediately north of Ottawa, Ontario, rarely figures in those periodicals exploiting the great out-doors and depicting the glories of the woods and streams, especially those published on the American side of the border.

There is a beautiful country just north of the Canadian Capital where probably in the logic of the Irishman one third of the land is water, lakes all sizes and shapes lie scattered about throughout this territory, beautiful lakes—the great majority of them free to the hunter, fisherman and canoeist—comparatively few being leased to private parties or individuals. There are lakes and streams as wild and wonderful as one could wish for, if he is willing to penetrate a little distance beyond the line of steel.

The Gatineau River—a stream almost as long as the Hudson—dark and sullen in some places and dashing itself into a white foam over mighty rocks in others, at last after its three hundred mile course empties its amber-hued waters into the mightier Ottawa just across from that thriving city of one hundred thousand population which is the seat of the Dominion Government.

Hundreds of square miles of terri-

tory containing a veritable net-work of lakes are drained by this picturesque water course. The real starting point and place of equipment for a trip into the Gatineau district is Ottawa and it was here we arrived after an all night ride from New York the last week in July. Here we engaged our canoe,

bought supplies and whiled away a few hours, not detained so much by the attractions of the place, though its attractiveness cannot be denied as by the fact that we both were of one mind as to the advisability of getting well fed up before leaving for the woods where we willingly admitted our own training in the culinary art would not quite measure up to that of the chef at the Chateau Laurier.

A good train service is maintained on the C.P.R. (Gatineau Division) for ninety miles into the Gatineau region. We left the Union Station in the early afternoon and immediately crossing the Ottawa River just above the Chaudiere Falls, were then in the Province of Quebec and started on the last lap of our rail journey, a stretch of seventy-five miles through rugged farm land, past French villages, skirting the Gatineau River much of the time and finally after a fascinating ride of four hours reached Blue Sea, a station at the southern end of Blue Sea Lake.

Here we alighted and having failed to connect with our canoe before leaving Union Station, were obliged to put up for the night with one

Antoine Benard and his tribe. Antoine, whose place of abode is only a couple of hundred feet from the railroad, is certainly doing his bit for his country. Up to the time of our visit he had been responsible for an increase of no less than eighteen in the population of Canada—no slacker is Antoine. Like so many of his kind he is a good-natured, obliging sort of chap and hesitated at nothing that would aid in making our short stay not only comfortable but enjoyable as well. The canoe arriving by morning train, we soon had it at the lake side and having selected from our steamer trunk, which we left at the house, such things as we thought necessary for our comfort in camp, we commenced to pack. This took considerable time as we had besides a heavy canvas tent, two suit cases containing apparel, two folding cots, two wooden boxes filled with supplies, blankets, etc. Care in packing was necessary as they with ourselves constituted quite a heavy load for our sixteen foot Fredericton. Nor were we sorry later that we had taken the precaution to see that everything was properly stowed away as no sooner had we pushed out into the lake and rounded the first point of land on our right, with Antoine and several of his offspring watching us from shore and waving their adieux, than we struck rough water. Myron was in the bow, I in the stern and those whitecaps certainly did look a bit formidable to us—they might well have caused more experienced canoeists no little concern.

Blue Sea Lake is eight miles long with several islands of good size in the upper end, but in the lower stretches there is plenty of sweep for the wind blowing out from the Laurentian Hills on the north-east and the water is certainly more than ankle-deep. Good trout fishing is to be had in Blue Sea but one must be properly equipped for deep-trolling. We made no attempt to try our luck as besides weather conditions being unfavorable we were anxious to get into one of the smaller lakes before making camp.

By what we ourselves considered skilful manoeuvring, keeping fairly

close to shore most of the time and exerting the utmost care in cutting the waves at the proper angle, we arrived after a hard paddle of four miles at the mouth of a small creek entering Blue Sea on the right. This is the outlet of Grant Lake. Into and through this we made our way until the water became so shallow we were obliged to get out and ease our boat over in a couple of places. This meant wet feet but a little inconvenience of that sort is taken as a matter of course in a camper's life.

Just at this point the railroad crosses the outlet. There is a little widening in the brook and some water lilies were in bloom. In our exuberant state of mind we had the temerity to pluck two or three. No sooner done that we were struck by a broadside from the hill on our right, where stood a summer cottage. One of the female of the species, in tones not dulcet, but sharp and rasping and in English so plain that it was positively ugly—harshly berated us for trespassing. This took the wind out of our sails for a moment but we soon recovered a bit and after some rapid mental calculating concluded that although the enemy may control the territory in that vicinity she had no monopoly on the air—so inhaling a deep breath of the bracing ozone without at all feeling under obligations to her we were ourselves again and pushed on. I am sure she hailed from the city as we found the natives without exception to be a real decent sort of people. Should these words come within the line of her vision and she must be gifted with a keen sense of sight, I trust she will feel sufficiently rebuked for permitting herself to have such a "nawsty disposition."

Getting our canoe into deeper water we made our way over the glassy surface of Grant Lake to a large flat rock jutting out from the western shore. It had not been our intention to stop here but as this had been our camping site on a previous trip after the small-mouth, we decided to land, take a look at the familiar spot and there cook our first meal.

As soon as the canoe was made

secure and we got the kinks out of our knees, Myron got out his rod, adjusted reel and line and with an artificial minnow as a lure made the first cast straight out from the big rock—no strike—again “whirr” went the line as the minnow pulled out fifty feet and landed with a “plop” on the water. Steadily reeling in with not the remotest sign of a strike, Myron exclaimed “Well! I’ll be darned—I’ll bet there isn’t a fish left in the lake.” But not too easily dismayed he went at it again and made a third and longer cast a little to the left, nearer a bed of weeds, when somehow a three pound small-mouth bass did actually get caught on his Dowagiac. Before the “poor fish” had time to realize that all was not right he was being headed shoreward. Breaking water four or five times and dashing north, south, east and west in frantic efforts to dislodge the hook, he soon began to show signs of waning strength. He seemed like easy money then, but on nearing the top of the water and catching sight of two would-be sports from “Noo Yawk” he made another plunge for the deep drawing out thirty feet of line before Myron could check him. This was his final effort and he came up to the water’s edge without further protest, the first prize of the trip and a handsome one. A few minutes later he was resting in pieces in the frying pan over a hot fire and the odoriferous fragrance that fish sent out made us truly glad we were alive. As he smelt, so he tasted, our appetites already perceptibly sharpened by our five mile paddle.

What a difference there is between the fish caught in the Canadian Lakes and those on sale in Fulton market, New York. These lakes are mostly springfed and cold, consequently the flesh of the fish is firm and decidedly palatable, while those one purchases in the city, well! the less said the better.

It has been a long time wonder to me why the natives throughout the Provinces do so little fishing and hunting for their own consumption. I have lodged in farm houses in this region where within five or ten min-

utes’ walk partridge, ducks, bass and trout are to be had at the expense of a little trouble but these people preferred to live day in and day out on fat salt pork. It is not due to laziness by any means but apparently to a custom started years ago and from which, lacking initiative they seem unable to break away. I hope sometime to see the Canadian Government show sufficient interest in the welfare of these people to send out instructors to implant in the minds of the natives how to get more out of life, pointing out to them the wonderful advantages they have right at their doors. A little intensive training would improve their condition one hundred percent. Here is another mystery. Who can solve it? Why does the average farmer, with an abundance of health-giving air surrounding his habitation just clamoring to get inside see fit to keep his windows closed tight, at least in a portion of the house and thereby have an unwholesome, musty atmosphere pervade the rooms? Such is human nature until it has learned by bitter experience to put on wisdom.

We found that others had made use of our camp site since our former visit. This surprised us not a little bit as good camping places are hard to find on many of these lakes. In most places the shore is of rock and the woods extend down almost to the water’s edge with the underbrush and dead wood amongst the trees so thick that it is an arduous task to make any kind of a clearing. We decided to stay for the night at this camp and go on to Dam Lake the next day. The remainder of the afternoon was spent in fishing, keeping the canoe about one hundred feet off shore and casting in toward the more shallow water, with a little still fishing thrown in as a diversion until the sun sinking behind the tall spruces on the western bank reminded us that we had better get back to camp and make snug for the night. Supper over, pans washed and log fire started, we drew our canoe up on shore, brought up the canoe cushions and having pitched our tent after a fashion and arranged our cots, etc.

earlier in the afternoon, we planted ourselves, tired and happy, as near the blazing logs as possible. With chilled backs and parboiled fronts we talked over the events of our first day out, made plans for the days to follow and swapped some of our best stories—not only about fishing but on general topics. Myron knows something about the theatrical profession and some of the jokes he sprung he claimed were real "Broadway stuff," but if Broadway ever laughed at those jokes then I have been giving that unnatural thoroughfare, where the "chickens" arise at dusk and retire at dawn, a whole lot of undeserved credit. Some of those jokes, I know were related by Noah to his sons of the ark while catching blue fish off the Jersey Coast. A feeling of drowsiness beginning to come over us and the fire burning low we decided it was time to turn in. There is one thing about which both Myron and I reached the same conclusions, several seasons ago—that is the comfort to be derived from sleeping on a canvas cot is well worth the extra weight and trouble of getting it into camp. No more balsam bough beds on the ground for us. They sound well in story books—(in nine cases out of ten, spruce camouflages as balsam) and judging by the way these made-on-the-spot cosy couches and featured in the average camping experience write-up, one would think they had a real live Ostermoor beaten seven ways.

Lights out and we were soon asleep but awake again just at day break. Our tent faced the east. On the opposite shore there was a thickly wooded ridge so we reckoned it would be a couple of hours before the sun's warm rays would descend upon us. Even so, once up we were up to stay. We washed and dressed, or to be more accurate, dressed and washed in a hurry and shivered around while getting a fire going and breakfast started, when Myron stopped abruptly in the act of placing a slice of bacon in the pan. "George" he said, "look at the deer up at the head of the pond." I looked and sure enough at the extreme end of the lake

I could see four of them including two young ones. Just then the mist rising from the lake's surface obscured our view but in a few moments we could see them again, very distinctly. Pa and Ma quietly feeding while the kiddies were chasing each other up and down the shore through the long beaver grass which filled the gap between the reeds in the shallow water and the forest a hundred yards back. It was a pretty sight. We did not attempt to molest them, this being close season and there they stayed for fully a half hour very deliberately eating their morning meal and apparently enjoying themselves, in their security. A few minutes later on pushing out in the canoe and rounding a bend to the right of the camp on glancing up on shore, I beheld a beautiful picture. A full grown buck with head erect, stood motionless, gazing intently at me. He seemed not in the least alarmed but remained for several moments, no doubt wondering what kind of an object was gently floating over the lake's surface. Then suddenly saying to himself "safety first" he wheeled around and disappeared amongst the trees.

I brought in a nice pike of nearly three pounds, caught on the troll and of this we made our breakfast. The solid white meat fried in chunks with slices of bacon as trimmings was indeed delicious and we ate heartily, anticipating a rather strenuous few hours' work before the next meal. Breakfast over and a good smoke to settle things we were ready to break camp. Packing everything in as convenient form as possible for carrying, we again loaded the canoe and put off for the head of the lake on our way to the trail leading over to Dam Lake.

In making a passage through the dense patch of reeds which extended from shore to shore at this end of Grant Lake while yet a hundred yards or more from land we came upon a duck's nest, built on the water's surface and securely fastened to the reed stalks. In it were two eggs, carefully covered over with dry grass a means of protection against mar-

auders. We left it as we found it and paddled on in search of an opening leading to the trail. We were anxious to disembark with feet dry and it was only after several futile attempts to get the canoe up to within jumping distance of dry ground that we finally discovered a log extending out from shore. Apparently placed there for just such a purpose we managed to get our boat alongside and scrambled out without shipping any water in our boots. The log also indicated the exact spot where the trail began, so hastily unloading we carried our duffle up to the edge of the woods and soon were started on our way over the portage, carrying the canoe first. Not being laboring men in the accepted sense of the word we were obliged to make three trips over the half mile trail in order to get our entire equipment on the shores of Dam Lake. Arriving at the further end on our first trip across we went down to the shore to take a good look at this beautiful sheet of water. A sputtering and fluttering just to

our left caused us to turn around just in time to see an old duck with several young ones, half grown, doing their level best to get out of the danger zone. They half swam, half flew over the top of the water and rounding a bend a little farther on were lost to view.

A mink, one of the largest I have ever seen, made his way along the narrow strip of sand at the water's edge and disappeared amongst the logs. There truly was wild life in this region soon to be disturbed by our intrusion.

Dam Lake is one of the most beautiful in that section. Its waters are extremely clear, exceeding Lake George in that respect and in my opinion all other respects, for so soon as a lake becomes infested with summer cottages and hotels it loses all charm for me. With surface calm and sun shining we could see bottom at a depth of thirty feet. We pitched our tent close by the trail where it ends in a small clearing and about fifty feet from the water. Just in

front was a log skid used the previous winter by the lumbermen for the purpose of rolling the timber on to the sleighs to be drawn across the ice. A number of abandoned logs of good dimensions lay scattered about and these served us admirably as fire wood.

Dam Lake is two miles long and nearly a mile wide toward the southern end. Its shores were almost entirely of rock and thickly wooded with the exception of a small clearing of only a few acres on the eastern side. Squarely in the middle of this stood an unpretentious log hut, quite deserted at the time. We were practically monarchs of all we surveyed as with the exception of an occasional fishing party passing through or a Sunday visit from the French-Canadians living in that region, we were alone. Ours was the only boat on the lake so we had a real monopoly. Our camp in order, we set out after the small mouth black bass and were soon convinced that they were there in plenty. With indifferent luck we fished several places along the shore before reaching a small bay on the western side which later proved to be our favorite spot. First we anchored about midway between the two points forming the bay but eventually moved in close to the rocky shore where the water was twelve or fifteen feet deep. Fastening the canoe to the overhanging branches we could look down into the crystal depths and watch for a good sized specimen of the bass family to show interest in the bait. It was amusing and a rather unique experience to be able to choose our fish before catching them. Should a little chap of a pound and a half or two pounds with mouth wide open and eyes ablaze make ready to gobble the frenzied chub, he would stop, bewildered, at seeing the wriggling minnow abruptly and unceremoniously jerked away from him to be kept in reserve for his betters.

But when grand-dad weighing close on to five pounds happened along we would use our most persuasive powers to encourage him. He, wise old of guy, made wise by experience would

go for deeper water. Not all, however, of those with experience back of them would escape the lure as we caught plenty of four and five pounders, more than enough for our table. Those we could not make use of were returned to the water, still very much alive. Threading them on a string hung over the side of the canoe as soon as caught, we found that very few were too badly hurt to survive.

A gone-ish feeling somewhere in our anatomy would indicate more accurately than government standard time just when lunch hour had arrived. So back to the camp we would go build a fire, get out pots and pans and in a very few minutes, just as we were beginning to think that never before in all our young lives had we experienced such a vacuous feeling, would sit down to such a meal as one hungers for when in the city—black bass fried in corn meal, boiled potatoes, biscuit and coffee followed the canned soup, then for dessert, fresh picked luscious wild red raspberries with evaporated cream. The above is just a sample as each day found some variation in the bill of fare. We had brought some eggs from Blue Sea and these we were able to keep in good condition for several days by placing in a cool spot and covering over with a thick layer of green leaves. After three or four days, however, they began to bear a strong resemblance (get that word—"strong") to the kind you buy at the corner grocery when the shop-keeper unblushingly volunteers the advice—"You'd better hurry home with these."

The days were hot and the nights cool, almost frosty. We needed all the bed covering we could muster to keep comfortable. After lying awake and shivering for a couple of nights we awoke to the fact that the open space between the cot and the ground was responsible for our discomfort. This we remedied by a filling of closely packed spruce boughs and thereafter slept soundly until morning. A comfortable night's sleep, a dip in the cold water first thing in the morning followed by a good vigorous rub-down made new

creatures of us. "Each day we stay, takes a year off my age," I ventured to remark. "At that rate" said Myron "if we remain much longer it will be several years before you were born." (more Broadway stuff) With the exception of one rainy day we had delightful weather throughout our stay at Dam Lake. The mornings we usually spent on the lake having more sport than a little with the bass. In the afternoon we would rest in the shade of the trees surrounding the tent, or go exploring along one of the many logging roads in the vicinity. On these hikes we kept pretty rigidly to the trails as the bush is so dense there is grave danger of one losing his bearings and wandering for miles in the wrong direction. A couple of hours just before sun down were usually put in at our favorite bass grounds in the bay across the lake—making it a point to always get back to camp and supper started before darkness closed in. Dishes washed and camp straightened for the night, we, Myron with his "seven cent straight" and I with my pipefull of English Curve Cut would settle ourselves near the log fire for an hour of perfect ease and contentment.

The crescent moon just setting over the dark spruce tops on the opposite shore, the big dipper sparkingly brilliant directly over head, the whip-poor-wills keeping up their incessant call, a splash in the water made by some small animal, a little way along the water's edge, an occasional call of the loon, all these made us feel delightfully isolated. Even a slight tinge of homesickness crept over us both I fear. I know I felt it, when suddenly Myron would break the silence, "Say George did you ever hear that joke about"—he commenced but fortunately for me just then a long drawn out cry coming from the further end of the lake sent a thrill through us both and I was spared. Starting with a sudden crescendo it died down gradually in a most dismal wail. "An owl," said Myron. "A wild cat," said I. Whatever it was, it sounded most weird. Twice more we heard

it before turning in for the night and it but added to our feeling of loneliness. To bed and soon asleep, then waking again at break of day we were as chipper as ever. So the days went by, enjoyable health-giving days until the morning set for our return. Getting up earlier than usual we had an hour's fishing before sun-up, bringing in a fine four pound bass and a pike of heavier weight. We cooked part of each for breakfast. If fish is good brain food as claimed, then our intellects should be of a dazzling brilliance upon our return, we figured. Recrossing the portage and Grant Lake as far as the big flat rock we stopped for lunch. The wind which had been blowing moderately all morning now rose to a stiff north-easter. The white caps warned us not to venture further. Toward six in the evening, however, there was some abatement so seeing that all was snug in the canoe we started across Grant Lake to the outlet. It was a hard paddle and we were glad to reach safety in the narrow creek. Our friend with the rasping voice was nowhere to be seen, we hoped the gale had left her speechless for a while at least. On we went through the outlet, turning to the left on entering Blue Sea. The water was still very rough, more so than we had expected as the wind was undoubtedly going down with the sun. "Let us hug the shore," I suggested. "That being the only thing there is to hug," agreed Myron. The wind was at our backs fortunately and we went at a great pace past the rugged shore. "Rock ahead," shouted the man in the bow. With a strong stroke of the paddle the canoe was brought around forty-five degrees just in time to escape a huge submerged boulder. We could see it as we passed, just two or three inches below the top of the water. We shiver to think what the result might have been had we struck full force. There was deep water on either side and with a heavy sea running we would have had a most uncomfortable time of it.

Paddling with the waves, but now more cautiously, we made good time,

deciding it wiser to cut across the big bay indenting Blue Sea's eastern shore than to take chances of running on a rock. Once across we felt comparatively safe. A miniature Cape Hatteras at this point necessitated our heading out straight into the lake, then sharply turning the bow make for the shore line once more. Without further incident we drew up at Antoine's landing and mighty glad we were to step out on solid ground. It was almost dark and decidedly chilly. The moon now nearly full was just showing itself above the

horizon, a whip-poor-will, whipped poor will in one of the small trees near the path, Antoine's dog barked a welcome and our trip was over. Tomorrow would see us back in civilization, wearing starched collars and straw hats. But we felt like settling down for a winter's work, so our objective had been attained.

Somehow I sometimes think that getting out in the wilds is more of a novelty to me that it is to Myron, but that can be quite easily explained. You see—Myron lives in New Jersey

The Humber

King of Atlantic Salmon Streams

N. MILTON BROWNE

WHEN I think of vacation time I think of the Humber in August,—a placid, broad, deep-bosomed stream, which, after flowing through a primeval forest for nearly a hundred miles, empties into the Bay of Islands, on the west coast of Newfoundland.

An ideal water course on which the angler may spend a month cruising about and never twice cast his fly on the same water. There is no question of catching hard-fighting Atlantic salmon in this river, it is rather a problem what to do with all the fish that will come to your gaff.

The Humber is divided into two sections, the upper and lower streams on both of which there is fishing, such as, I believe, can be had nowhere else on this continent.

The start for the grounds is made at North Sydney, where the tourist goes aboard the Reid Newfoundland Company's well-equipped steamer, and, after a short run of a few hours—which is usually spent in sleeping—the passenger lands at Port-Aux-Basques, after a ninety mile voyage across the Cabot Strait.

The fare from North Sydney to Curling, Bay of Islands, where the angler stops if he intends to fish the lower Humber, is twenty-seven dollars

and ninety cents return, and for the service rendered this amount is trifling. On arrival at the Port breakfast is had on board the train, and about 9 o'clock the trip to the interior commences.

During the earlier stages of the journey the voyageurs pass through the famous Coudroy Valley; the express skirting along the base of the Cape Ray mountain range, the slopes of which are visited annually by etomologists from different parts of the globe who, armed with nets, scour the hillsides for specimens of butterflies and bugs, a realm of sport in which these people seem to find much amusement.

The first salmon stream passed on the way is the Little Coudroy, then Big Coudroy, Crabbe's, Robinson's, Fischell's, St. George's, and Harry's Brook, in the order named. These are all early rivers, salmon starting to run along about the second week in June. I have fished all these waters and can guarantee all of them as fine places for the angler to visit.

After a run of about six hours the train stops at Curling, a little out of the way village nestling close down by the sea, and washed by the waters of Bay of Islands.

The panoramic beauty of this

magnificent stretch of water is indescribable in a mere word picture.

The bay is surrounded by a great semi-circle of hills, the tallest of which, Mount Blow-Me-Down, is twenty-one hundred and twenty-five feet high. These miniature mountains rise sheer from the sea and are wooded from base to summit with a wilderness of spruce and other native trees. In sheltered places on either side of the harbor, little villages occupied by fishermen find precarious footing on the fringe of the water, their white-roofed cottages furnishing a charming setting to the emerald green of the hills and sapphire blue of the sea. The sunset effects at Bay of Islands are beautiful beyond anything I have witnessed in any other section of this northern clime.

Arriving at Curling we engaged guides, camps and necessary paraphernalia for a month's stay on the river.

On the Lower Humber a guide with motor boat, canoe and camps costs about five dollars a day. Should you desire to go further up-stream, the figure advances according to the expense of operating the gasoline boat.

Previous to the big adventure we enjoyed some splendid sea-trout fishing at Hughe's Brook, across the bay from Curling, and at the foot of Blow-Me-Down—at the latter place in a tiny lagoon, which has been carved out behind the beach by the action of the stream which finds its way down the mountainside. This is an ideal spot for women anglers. During a short stay here we caught hundreds of sea-trout, many of which weighed over six pounds.

After a week of splendid sport we came back to Curling where we found everything ready for the big kill on the Humber.

We started at daylight and a run of three miles and a half brought us to the head of tide-water. There are a number of fine pools on the way; but, of course, these cannot be fished with any hope of success unless the stream is very low, as salmon will not rise to the fly in salt water. How-

ever, in season, the many shoals fairly teem with fish.

Some of the best places to try your luck are Duncan Rock and Shell Bird Island shoals.

Four miles from the mouth of the river, Steady Brook, one of the best fishing and camping spots on the Lower Humber, is reached. Here we pitched our tents and made ready for a couple of weeks solid enjoyment.

The water runs deep and strong on the Lower Humber, with the result that all the fishing is done from shoals, one of the best of which is Hard Scrabble.

As an illustration of the kind of sport that may be had at this point, I take the liberty of republishing the following from "Western Star," Bay Of Islands; "Miss Lois Reid, daughter of Sir William Reid, beat her father on Saturday at salmon fishing on the Humber having secured a fish which tipped the scales at 3 pounds. Her brother, Leonard, caught a 30-pounder, and Sir William himself was successful in landing a 29-pounder. Later Sir William landed a 32-pounder, G. W. Stewart, of Truro, gaffed a 36-pounder, and Dr. Fisher killed a 337-pounder."

Salmon weighing above forty pounds have been landed at this point, but I could find no reliable records of these kills. Undoubtedly the biggest fish are taken from the Humber.

In a week's stay at the lower camp we caught so many salmon I should hesitate to name the total number. During the last couple of days we used to play the fish until they were exhausted and then give them their liberty.

This spot offers ideal sport to the trout fisherman. Steady Brook, which empties into the Humber, is navigable for about a mile by motor boat, from where, after leaving the launch, we walked to the falls, at the foot of which there is a fine deep pool from which may be taken any number of fish. The fall is between eighty and one hundred feet high, an about forty feet wide at the top. All summer, practically, except in the driest seasons, there is a great rush of water flowing over the falls, with the

Nº5 Now for the net

Nº6 The days Catch.

resultant effect of wonderful scenic views.

After eight days on the Lower Humber we broke camp and heaving our dunnage aboard the motor boat began our cruise to the Upper Humber.

The stream varies from about a hundred feet to half a mile in width, and both banks are lined with a thick growth of spruce, fir, birch, witch-hazel, poplar, ash, juniper and cherry trees. Beyond Steady Brook about eight miles we entered Little Rapids, which, though quick water, is navigable for motor boat. The stream is very wide at this point and abounds in shoals, in all of which there is good fishing.

Big Rapids, about a mile farther up, has a fall of about four feet over which even in the driest seasons a motor launch can be portaged over at either side. As in all other parts of the lower Humber a heavy tide runs at this point, sometimes making nine miles an hour.

Thirteen miles from Bay of Islands we entered Deer Lake, a beautiful sheet of water some nineteen miles long and from one and a half to two miles wide. At almost any place one chooses to drop a fly while traversing the lake, a trout or salmon might be hooked.

From the head of Deer Lake to the forks on the Upper Humber is five miles, all steady water, and, therefore, easily negotiated.

The forks are formed by Junction Brook, flowing from Grand Lake, and Willows Steady waters. A mile farther up is Seal Pond rapids, and here ends motor boat travel.

In the pool at the foot of the falls the painter of the little launch was snubbed to a birch tree, and our dunnage thrown aboard the two canoes, which had been in tow since we left the village.

Grand Falls was reached after a day and a half's paddle through a country

unrivalled for scenic beauty. The only portage on the way is at Little John's Falls, over which a canoe can easily be carried.

We arrived at our journey's end about six o'clock, and long before the first faint glimmerings of twilight began to close down on the land our guides had the camps up, we ate a hearty supper, filled our pipes, put the rods together and laid out our paraphernalia ready for a try for salmon on the river at daylight.

It would be impossible, in the short space at my disposal to give even the briefest synopsis of all that happened during our two weeks' stay in the heart of a wilderness seldom visited by man.

Our party killed numberless salmon, many of which weighed over thirty-five pounds, and never a day passed that we could not land as many fish as we wanted to. They were there in the pool below the falls in myriads, and it was only a matter of casting the fly to get results.

Our trip out was even more enjoyable, if that were possible, than that going in, as we had the tide with us and had little to do but steer the canoes.

A most enjoyable feature of the trip was the unfailing courtesy and prompt attention bestowed upon us by the obliging officials of the Reid Newfoundland railway and steamship company's lines. They were indefatigable in attending to our creature comforts and materially assisted in furnishing us with addresses of guides, hotels, etc.

One little bit of advice in closing: Don't go to Newfoundland without a plentiful supply of fly dope. Every known species of mosquito is to be found on the Humber, and your trip will be utterly spoiled if you fail to take a preventative against the assaults of these little pests, the bane of fishermen.

Three Times and Out

F. V. WILLIAMS

A meadow mouse scurried along the little path and dived mysteriously out of sight into a tuft of tall grass. Panic? Say, it was illustrated in every jump that meadow mouse made, and he was in sight of the big white leghorn rooster for at least five jumps. With the air of one who is sure of himself, the big white fowl strutted forward to investigate. The ladies of his harem scattered about in the surrounding tall grass were no doubt watching him with admiration and it was up to him to prove himself as important as possible; be it known, the whole flock of chickens from the nearby farmhouse had strayed over into this part of the field and were having a high old time chasing "hoppers," which gave variety to their regular bill of fare.

As was mentioned before, the big white leghorn rooster strutted forward to investigate the hiding place of that meadow mouse, and in doing

this he followed the same direct line of travel taken by the mouse. He had gone perhaps one half the distance when the tall grass parted noiselessly a little to the left and back of the big white bird. The human eye could not have followed the movement of the long bodied creature that landed with the agility of a cat on that rooster's back. "Cock of the walk" he may have been, but he never had an opportunity of defending himself. There was the crunch of sharp fangs through his neck and he settled down in his tracks with a convulsive kick or two and was quiet. His neck cleanly broken, and, for perhaps five minutes the killer busied himself about the body. What he ate of that fowl would scarcely have been noticed, but of the warm blood he drank his fill, and slipped away through the grass before even his barnyard mate had discovered the tragedy.

That night the discussion up at

the house divided itself over the white rooster's death, part of the family were sure rats were to blame—of which there were quite a few about the barn—the other part of the household was sure it must have been weasels, as a family of weasels were known to have a den in a huge pile of brush near by.

At any rate a war of extermination was declared on both rats and weasels and for a start, that very night sundry traps and baits were placed about the barn.

The next day the whole family and "Collie" the dog, surrounded that brush pile. Everybody had a stick or hay-fork, whichever weapon happened to be most convenient. The match was applied to windward and in a very few minutes the whole end of the brush-pile was in flames. Now the hunters expected that once the fire was started, the weasels would rush out, but such was not the case. The fire had burned some time and the watchers were a bit off their guard, when of a sudden a brown slim body shot out from one side of the smoking heap of brush and made for the tall grass. There was a rush headed by "Collie" for the weasel. Ever try to catch a weasel on rough ground, with bunches of grass here and there, lots of cover for aforesaid weasel? Everybody got in everybody else's way and "Collie" all excitement, snapped here and there, only to get a mouthful of grass when he got anything, and while the chase was at its height someone yelled, "There goes the other one!"—and sure enough, the other weasel was bolting in the opposite direction. This divided the pursuit with the result that both weasels got safely away.

"Guess about all we will get from this excitement is their hiding-place cleared out," remarked someone, and several of the party had started to go about their regular duties, when a squealing and screaming began from the interior of the burning brush-pile. There were young weasels in there and the flames had reached them. Their cries reached other ears than those of the people standing about. "Collie" noticed it first, and before the old weasel got half way back to

her burning home, he was upon her. Yes, sir, she was coming back, the cries of the young ones left behind were too much and she was returning to that smoking, burning brush pile. But this time "Collie" had judged the distance right and with a snap he seized that weasel and threw it into the air, catching it as it came down, and blotting out its life with a crunch of its long jaws, and almost at the same time there was a cry of "Oh! look, look!" and the second weasel was discovered racing swiftly for the endangered young ones; a lucky thrust with a hay-fork and he too was accounted for. The flames having eaten through the brush pile, there was no further sounds from there. The flames had done their work, you and I and the other fellow all know that a weasel is a blood-thirsty little pirate—still, in the face of all the danger surrounding those two small pirates, their attempt to come to the rescue of their young—what would you call it—instinct, parental affection, bravery or what not? Whatever or however you may account for it, this much I think we'll all agree on,—that it sure was *admirable*, to say the least.

And then two days after—in the corner of the oatbin in the barn there was a rat-hole and opposite it a steel trap had been set for rats. The gentleman who had set the trap was on his daily routine of work and this morning he glanced in to see if the rats had been careless enough in the night to step on the pan of that trap—and well, he sure *was* surprised, for instead of a rat was the largest, fattest weasel he had ever seen. The jaws of the trap had closed high up on the shoulders, shutting of his wind and holding him fast. As his captor picked up the trap to examine him he noted with astonishment that both front and hind feet on the weasel's left side were missing, the healed stumps of legs bearing mute evidence of at least two other experiences with traps.

"'Three times and out' tough luck, old timer!" commented his captor as he carried him toward the house to exhibit his prize to the family, the slayer of the white rooster.

Just Reminising

—ARTHUR J. ALGATE

I.

IT all goes to prove that you never can tell what an old bass is likely to do. Maybe some of those unexplainable but none-the-less memorable lucky days are attributable to family jars in the fish household, or Mrs. Bass may want to house-clean and Daddy Bass being ordered out of the house decides to see what he can see. The day may be bright and cloudless, just a regular lounging around day in the bass community, but seeing he is driven from his cosy corner in the shady depths of some secluded cavern, Mr. Bass must needs do something,—so he takes a stroll on the off chance of "picking up" some tid-bit inshore where such dainties are most likely to be found.

Reminds me of a day in early August, hot, breathless, water like a millpond. Our visitor insisted on fishing. Muskoka meant only one thing, fish and fishing, without regard to time or circumstances, so fish we did in spite of conditions. Result—lunchtime and nothing to show but a lively coat of sun-burn. Luncheon over, pal decided he'd had enough, but just to keep busy I pushed the canoe out to a submerged rock, an old favorite of mine, cautiously dropped anchor over side, and drifted over into casting position being careful to avoid any shadow falling toward the fishing hole. There was neither rhyme nor reason in doing so,—conditions were most

inauspicious—just felt in the humor to fish around a bit—so I picked me a lively crawfish, baited up, and made a long cast out over the edge of the rock. No response, but then no one in the neighborhood was expecting any, sure not me anyway! Floated idly, smoked awhile, then lopped another cast into the same spot,—*swish, bang, z-i-n-n-g*. I was the most surprised man on the lake and out there in the blazing sun not a ripple except the splash, plop, splash, and ever-widening rings where Mr. Bass catapulted skyward to return again with a back flap into his native element. I had a battle royal. A battle which flashes again betimes on memories movie screen. His handsome hide looks down at me now a token and reminder, that you never can tell, when, where, or how "the day" is going to arrive;—that hoped-for time, when you will connect up to some old he critter of a fish that sends you cityward, vacation days o'er, with that satisfaction in a holiday well spent and a trophy to prove your prowess, known and appreciated by none so well as the followers of *Rod and Gun*.

II

"Why that Lake was fished out years ago,—there's no fishing there!" Ever hear the wise people talk like that? I like to hear it for

it's almost a guarantee that a few old granddaddies are drifting around in the deep holes, just waiting for the man on the end of a line who knows "how" and his patience to prove it.

Reminds me of a day, sunshiny—lots of fleecy clouds and a wind out of the southwest, which chopped up the water and made it fairly boil over on our shore. I wanted fish—we all wanted fish—company was expected and fish was the *menu*. A survey of the wind, waves and water, made that *menu* seem distant and hazy. But one never can tell, so I gathered my tackle and pushed the

Arthur J. Algate

canoe out of the sheltering cove into a roily, ripping sea. Dipping and rocking with every wave, I coasted down to the faithful old fishing rock, dropped a heavy anchor, and sat tight to see what would happen. Held alright, fact is she's still there and many feet of my good hemp mooring rope, wedged tight on bottom.

Presently the company came and were duly directed down shore where supper was being anxiously sought, against all codes, precepts and examples. What was the use of getting wet and taking chances of getting wetter, when the weather was dead against fish biting to-day? Thus and other sundry admonitions from my weather-wise visitors as they perched on shore and proceeded to direct operations.

Did I stick it—well rather—for presently came a strike, not a record fish, but before he came to net, the audience got their money's worth and excitement aplenty. Playing a three pound bass in orthodox fashion, bringing him to net—from a canoe, bucking like a bronco on the end of a tether is exciting; yes, *somewhat*!

The game was on—another theory was fast being shattered—and the excited folks ashore saw nine nice bass come overside into the canoe in less than forty minutes—fish for supper after all—and everyone happy. You never can tell, brother fisherman—so if you get a hunch they may bite, take a chance anyway, for after all its not all fish in fishing, now is it?

III

"Say, dad, can you tell a bass fish's age by his teeth?" What do you think of that kind of curiosity, brother fisherman? Perhaps you've had a similar experience and are quite prepared to admit that a man must needs keep fully posted if he is going to educate the rising disciples of "Sir Isaac" in the way they should go. Arthur Junior, aged nine, had just played and brought to net a nice two pound bass, and naturally wanted to know how old he was, and for the time being I was stumped.

No son, you can't tell a "bass fishes" age by his teeth, nor by the same token can you tell the kind of fight he put up by looking at his picture.

I have seen bass which, on the scales, were a sad disappointment; but fight, my oh my, how they could jump, cavort across the surface shaking their head, or turn a back flip and slap the line with their tail in an effort to dislodge the hook!

My records do not give the ages of the victims, for they neglected to bring their birth certificates along, being called away in a hurry, but the following table does give emphasis to the point that all bass are not alike but one can tell with a reasonable degree of accuracy the weight of a fish by his girth and the kind of a fight he puts up, by his length. Girth is needed for weight, but for pure fight—ounce for ounce—give me the "red-eye" who has had to hustle for all living and has attained length rather than girth.

During the seasons of 1915-16-17-18, records show 82 black bass taken by me on rod and line. Of these 25 measured over 11 inches and under 15 inches, and 57 measured 15 inches or over. Measurement for

length taken to centre of tail, girth around middle of dorsal fin.

15 inch Class.

Authorities tell us that a bass is hatched in from ten to fourteen days after spawning—at the end of the first season, provided there is plenty of food, he will measure about four inches, at two years he may reach a pound weight and thereafter will take on flesh at the rate of about one pound a year. (A black bass is at its prime and commences breeding when three years old.) Thus the fish that got away, the one we hope to get this season, that five pounder, will be about right age to commence school.

Reminds me of a city friend who wanted to catch bass badly; wanted some to take home at the week-end and becoming discouraged at his success (or lack of it perhaps I should say) in home waters, took train to spend a day some miles along the line. There were some chores to do around camp that

day, but as evening approached I felt that impulse to fish and propelled my little Lake-field cedar into a likely spot for the evening feeding. An hour passed all too quickly, but there were shiny dark forms lying on the bottom of my canoe to prove those were sixty golden minutes to one fisherman's heart and I was idling the closing moments of a "perfect day," watching a glorious sunset, when a hail reached me across the water "What luck?" "W-h-a-t l-u-c-k" came again as I cupped my hands and called "Come and see" Our friend had returned from his expedition with some perch and pickerel. Imagine his astonishment and chagrin as he pulled his skiff alongside the canoe and beheld seven bass totalling just a few ounces under 20 pounds. The record follows,—

1 Fish 4 Lbs. 7 Oz.—Length 19 inches.

1	"	3	"	6	"	"	17 $\frac{1}{4}$ "
1	"	3	"	4	"	"	17"
1	"	2	"	12	"	"	16 $\frac{1}{2}$ "

1	"	2	"	0	"	"	15 $\frac{3}{8}$ "
1	"	1	"	4	"	"	13"

I had baited just seven hooks, made just seven casts, and "scored" every time. Each time as I set the hook and prepared for action, I called to the folks in the house to come down to see the fun, so close was it to home.

Needless to say it was fun, both in playing those seven nice fish and in seeing the look of utter disbelief in the eyes of our city friend. Oh yes, he had bass to take to the city, but he didn't catch them. He had the fish but I had the fun. With whom would you trade brother fisherman?

N.B. My fishing in the past five years has not yielded any record fish. I still have hopes.

The Pleasures of Angling

JOHN MOSSOP

WITH the beautiful days of spring come the thoughts of fly Fishing. Did you ever notice how most authorities on the subject from Izaak Walton to Henry Van Dyke recognize a nice distinction between fishing and merely catching fish? Your true fisherman will surely need recourse to the consolations of philosophy, if he comes to the end of the day with an empty creel, but, nevertheless, he is not readily persuaded that it was mere fish that he wanted. He was seeking a much more subtle enjoyment than could ever be apprehended by simply possessing so much fish. This idea is treated with a master touch in the second chapter of "The Calling of Dan Matthews."

"Hello," said the doctor, with gruff kindness, 'any luck?'"

"The boy's quick smile showed a set of teeth, the most perfect the physician had ever seen, as he answered: "I have caught no fish Sir." By these words the philosopher knew him instantly for a true fisherman.

"Have you been farther up the river Sir, it's much better than this?" and the older fisherman asked, 'A better place to catch fish!' 'No sir, a better place to fish.'"

This distinction has been well expressed in a bit of delicious verse taken from a book of Essays in "Profitable Idleness."

*This is not a proud desire of mine,
I ask for nothing superfine,
No heavy weight, no salmon great,
To break the record, or my line.*

*Only a trout or two to dart,
From foaming pools and try my art,
No more I'm wishing old fashioned fishing
And just a day on Nature's heart.*

All is fish of course which comes to the net, but the day's fishing is somehow incomplete if it has not yielded, at least, a brace of trout. A test of skill against a brisk trout is one of the superfine delights of the angler. Perhaps this is because, as a modern novelist has pleasingly said: "The stream trout represents the strength of the rapids, as the mountain trout represents the strength of the mountains." In all the wild life of the mountains there is no creature so strong in proportion to its size, and weight as the trout, especially the trout that lives in the mountain streams. Its home is in the icy torrents that

are fed by the snows of the highest peaks and canons, it lives literally in the innermost heart and life of the hills. It seeks its food at the foot of the falls where the water boils in fierce fury, where the currents swirl and leap among the boulders. as the angler who has fished the Bonnington Rapids and Slocan Whirlpool will agree with me.

Where the stream rushes with all its might down the rocky channels with its muscles fine as tempered steel, it forces its way against the stream conquering even the fifty foot downward pour of a cataract. Its strength is a silent strength, and yet in the roar of the stream the trout is very wary of unnatural sounds, objects or shadows. To the uninitiated it must seem to be a queer mood that induces a man to go groping along the water courses clambering over inconvenient rocks and wading through long stretches of running water, patiently casting his flies in dull and uninspiring repetition, but as Henry Van Dyke truly says: "This seems like a regular and somewhat mechanical proceeding, but in the performance it is rendered intensely interesting by the knowledge that at any moment it is liable to be interrupted, and when the interruption comes, what an exquisite and unparalleled luxury it is to feel the solid weight of the fish against the spring of the rod, and the curious thrill which runs up the line and down the arm changing somehow or other into a pleasurable sensation of excitement as it reaches the brain."

Oh yes, all this is good, very good, quite a simple pleasure perhaps, and somewhat primitive, if you please, but at least it does not leave a bad taste in the mouth. It has been said, that no man can be a really bad man, if he loves fishing, and many of the good and great have been devotees of the art. It is said that when Sir Edward Grey was in Parliament his word carried more weight than did the word of any other man, others spoke as from the bar, he spoke as from the bench; others argued, he delivered judgment. When Sir Edward spoke his word was regarded as the final word in the particular issue, and remembering this it is significant to notice that the only book he has written is on the art of fly fishing.

Dr. Paley was ardently attached to the amusement, so much so that when the Bishop of Durham inquired of him when one of his

most important works would be finished, he said: "My Lord, I shall work at it steadily when the fly fishing season is over."

There are some who like to think of fishermen as a fraternity; a secret brotherhood; and indeed the methods of anglers do lend themselves to some such construction, they have their signs whereby the members of the craft are able to recognize a brother, they have their unwritten law, which none would presume to violate, they have their code of maxims and ethics, and ritual. An ancient "Tretyse of fishing with the angle" exhorted all true anglers to take good heed that "in going about your disportes we open no man's gates, but that ye shut them again." The novitiate must look well to his habitual temper of mind for no less an authority that old Izaak himself affirms that anglers are of a mild, sweet and peaceable spirit. Henry Van Dyke speaks to and for a modern age, but he also bases the fundamentals of the order upon qualities of the spirit.

An angler, like an Arab, regards hospitality as a religious duty, there seems to be something in the craft which inclines the heart to

kindness and good fellowship. Few anglers have I seen, who were not pleasant to meet and ready to do a good turn, to a fellow fisherman, with the gift of a killing fly, or the loan of a rod, not their own particular and well proved favorite, of course, for that is a treasure which no decent man would borrow, but with the exception that the best in their store is at the service of an accredited brother.

Following the analogy, we may say that it is an order which has its varying degrees wherein the novitiate is taught many wise and helpful lessons, learning many things that are not taught in colleges, learning to take the weather as it comes, wet or dry, and fortune as it falls, good or bad, learning that a meal which is a scanty fare for one becomes a banquet for two, provided the other is the right person; learning that there is some skill in everything, even in digging bait, and that which is called luck consists chiefly in having your tackle in good order.

These few lines are written in anticipation of spending some days fishing.

Trust in Providence, be quiet and go angling.

ROBERT PAGE LINCOLN

THE pictured side of angling is often the wholly imaginative side; or nearly so. The actual thing about angling is that it is generally pursued under conditions that are nothing if not detrimental to what is ordinarily considered as pleasure; though these conditions are never mentioned in print, for the angler never wants his brother angler to know that he has encountered difficulties; that he has had ill luck; that everything was not as it should be. If we are to go to the pictured side of angling we view the reproduction of a painting of an outdoor artist, for instance, appearing on the cover of a monthly magazine. Inevitably the artist portrays a

broad pool with a waterfall tumbling into it and the conditions generally are such, in a picture of this sort, that casting the fly is a thing easily to be contrived. But never will you see a painting of a man lost in a wilder-

ness of bushes endeavoring vainly to slip in and get a shot at the stream that snakes along under the tangles. Were such an painting to find reproduction the angling brotherhood would not be pleased; for the simple reason that it would be distasteful to the remembrance of many who have done most of their fishing along such streams, but have always dreamed of a big wide stream where the poetry of fly casting could be carried out in the fullness of its charm.

Of wide and easily fishable streams, there are many all over the broad reaches of this continent. Yet at least half of the streams of Canada, and the United States, are of the brushed in sort where one must be the possessor of an acute sense of cautiousness and skill to have even a scintilla of success. Yet one searches vainly throughout the various annals of sport for temperate articles on fishing just such streams.

Ever-present rules of angling abide in the consciousness. They are not hard and fast rules; if they are to be considered rules at all. Nevertheless it is consistently held that the artificial fly alone should be used in trout fishing. The truth of the matter is that there are streams where the fly cannot be used; it being a "physical" impossibility. Hence there is only one thing to turn to and that is the live bait. Recalling the ingenious words of one well-known writer that: "The sportsmanlike angler always uses the artificial fly, except when he is alone," or words to that effect.

The joke of the whole thing about the brushed in stream is this: It is as apt as not to possess some of the finest trout to be had. But one can just picture these sleek fellows in hiding, laughing, figuratively, "up their sleeves:" "Get me if you can." Usually one can't, and there you are.

If one were ever needing of the science of angling, it certainly is when trying to circumvent a stream of this sort. It is a test of skill to the limit. The man who can fish the brushed in stream successfully, even with live bait, ranks well in the lead among the anglers. Now I say this, knowing full well what I am talking about. You approach a stream of this sort. Sometimes you are not able to see it for the tangles. What to do? It is a matter of thrusting the rod in here and there and trusting to the gods that luck be thine. If you catch a fish there is not much chance of playing the fish to net after the time-honored rules, but you must lift that fish out as best you may through that

ceiling of shrubbery. Nevertheless there are open places, here and there, and to find these places, is like as not, the open door to success. The lure to the hook cannot always be cast. One slips in here and there, drops the lure to the bottom, feeds out line, letting the lure take its way down the stream. If you are using the angleworm, it is hooked, not through and through as one does who is given to still fishing, but rather inserts the hook right under the skin. A little movement now and then, (the slightest wiggle to the worm), will prove unfailing in its attraction. It is just this system of worming for trout that John Harrington Keene extolled, though it was his favorite method to keep the worm off of the bottom of the stream as he had a particular aversion for the bottom fisher.

A single hook in bait fishing, attached to the leader's end is one way; two hooks are often used, and I may say one is more sure of a catch. One hook is slipped onto the leader and fastened one inch above the hook that is connected at the tip. Thus the back hook is inserted under the skin of the worm at one point, and the front hook right in the thick collar of flesh around the worm's neck. When a trout takes this, if he is hungry, he will be well hooked; and a trout needs to be well hooked that is to be taken in the brushed in stream.

There can be no doubt about it, the heavier rod must find a place in bait fishing and especially in fishing along the streams of which I have spoken. Some prefer a rod of eight ounces; although the regulation six ounce trout rod will do. In my line of preference for this work I list rods and their material, as follows: (1) The steel rod. (2) The wooden rod. (3) The bamboo rod.

One rarely likes to go up against difficult fishing with a thirty dollar, hand-made, bamboo rod, when a six dollar steel rod will do as well. Again there is little if any casting to do; save slip casts and under-handed casts and these are easily contrived with the steel rod, suitable for the purpose.

You may speak forever about the single-action reel for other sorts of trout fishing, but the automatic reel has the foremost place whenever there is difficult fishing to be done. It facilitates recovery of line in a manner that is impossible, try as one will, with the single-action reel. Therefore the successful bush trout fisher avails himself of any one of three makes of automatic reels that I know of, and has no trouble in making connections

It is desirable in bush fishing for one to have a leader free of knots, or at least of such small knots that the leader may readily be reeled in up close to the hook, for very obvious reasons. A knotless leader such as the Telerana Nova comes in very handy. It is not necessary that the leader be over three feet in length, tho' I vastly prefer the six foot one. To sink the leader, if it is desired, one may wind on strip lead, which, after all is much better than the split shot and once put on it stays, whereas the split shot are always coming off. One may shave off his own strip lead from a piece of pipe.

Some prefer to use very small hooks for this sort of fishing; others use the Number 10 consistently, and I cannot help but recommend it for the purpose.

Of course there are many sorts of streams to be considered in the brushed in stream class. There are those of the rivulet class, tho' having deep holes, and "runs," along their course. This class of stream may be all the way from three to six feet wide. Strange as it may seem such streams often have remarkably deep holes along their course. Find those deep holes and you like as not run into a nest of fine big fellows just waiting for a chance to nab your lure. Other brushed in streams beside the above mentioned, range all the way from six to twenty feet in width. Again, a stream may be quite wide, but the tendency of the willows, laurel, alders, etc., to lean over that stream from both sides makes it quite difficult to get at. Some of these wider streams may be waded, but wading a stream, especially if it has a muddy bottom will never do, for most of the time it is fishing down-stream all of the time and the stirring of the mud sends a discolored volume down, thus warning a fish of your approach. Some would have us believe that the fish think this coming of the roiled water down the stream make the fish believe that there is a rain on, and that, consequently, live stuff will be floating down; but such an assertion is laughable. Fish are not such fools, and know as well as we do when it rains. However, where the stream is rock set, the wading down stream is permissible.

It is given to the trout fisherman, under all conditions, good or bad, to study the stream that is being fished. Ascertain where the deep holes are, and how to get at them.

Make note of snags that will be encountered. If there are net works of roots along the bank, or thrusting out into the centre of the stream, the trout will instantly dart into the midst of these for safety, when hooked. There must always be room, too, so that when a fish is to be hooked there is no tangle of brush to get in the way. The hooking of the fish itself, in the brushed in stream, is something of a knack as you will, or have found out. Your line with the bait to it may be ten or fifteen or more feet downstream testing out the possibilities in the pool when a trout takes it. The very minute the trout lips hem that bait, (told by the "feel" along the line, and thence down the rod), you should set the hook. This is contrived by a gentle twist of the wrist, and no slam bang performance will do at all. Instantly upon hooking the fish the line must be recovered, and here is where the automatic reel proves its worthiness over them all. The line is taken in, with the left hand, while the right hand finger touches the lever that eats up the gathering. Again there is no such a thing as a slack line when using the automatic reel, because the touch on the lever instantly eats it up. For this reason I would never recommend the single-action reel when trouting under difficulties, no matter what those difficulties be. Even in the midst of a rushing river the automatic reel has points to its credit that no single-action reel can afford.

Much of one's success at fishing the small stream depends upon one's cautiousness of approach. To work up on a brooklet of this sort on all fours is really the best way. Trout are easily frightened by any sounds made along the bank of a stream; and certainly this is very true of the small stream, for the reason that one is brought in closer proximity with the fish. The trout of the small streams are very keen and alert. To get them one must acquire an alertness in proportion to the alertness of the trout. If he does this he will have luck and much of it.

There is an unapprehended amount of good fishing to be had along the smaller streams of the country. Perhaps there are hundreds of these streams that unobtrusively contain trout, without anybody's knowledge of the fact. In a country where streams are spring-fed along their course, or where there are spring pools in the streams, one finds brook trout fishing of the very best.

E. D. SISMEY

THERE are two kinds of salmon in the Pacific Coast waters that will take the hook, and are therefore available to sportsmen. These are the Spring, (Tyee); and the Cohoe.

The Spring Salmon sometime attain a great size. At Campbell River, Vancouver Island I think the record is fifty-six pounds, caught on rod and line. The Cohoe rarely weigh more than twelve pounds, but though small they are game and therefore furnish excellent sport.

Most of us are aware that the Pacific Coast salmon may only be caught on hooks during certain seasons and at the mouths of rivers. The salmon after coming from the open sea, pause a few days in their migration, at the mouths of rivers up which they run. It is during this pause they may be caught. The exact limits of the seasons vary in different rivers, and I will not pretend to give the limits. I will say, however, that August and September are the best months.

Two of the best known rivers in Vancouver Island are the Campbell and Cowitchan Rivers; both of these are easy of access, and have good hotel accommodation, boats and boatmen, also neither of these rivers are near the canneries.

The Campbell River is probably the best salmon river on the Pacific, though I must say that fishing there is no poor man's hobby.

The item that makes fishing on the Campbell expensive is the absolute necessity of an experienced boatman. I remember, (in 1912),

the services of a boatman cost five dollars per day, including boat, for about five hours fishing; two and one half hours twice a day during slack water. The necessity of a boatman may be realized when it is known that the tides sweep between Vancouver and Valdez Islands at ten to twelve miles per hour. Without a boatman one is looking for trouble, but with one, safety and good fishing are sure to be enjoyed.

On the Campbell River fish of forty pounds are caught and landed on light tackle every season while catching fish of twenty-five to thirty pounds is almost a daily occurrence.

Campbell River is at the end of the Island Highway, an excellent automobile road to Victoria; there is also a good steamboat service to all Coast points.

Not only is the salmon fishing not to be surpassed anywhere on the Pacific, but there is in the immediate neighborhood, trout fishing that I maintain can not be equalled anywhere in the world, beautiful lakes amid a primeval forest and over-shadowed by Alpine mountains capped with perpetual snow; these lakes teem with fish.

Cowitchan River, about two hours' run in the train from Victoria, empties into Cowitchan Bay, a lovely seaside resort, where fishing may be enjoyed along with the pleasures of a family summer holiday. Bathing, boating and fishing within this lovely land-locked bay are pleasures which can be taken at all hours with perfect safety.

The hotel accommodation is good and

out by their size. For this picture the rod has a fly-fishing tip. The trolling tip had been stepped on and kinked. All the same all the fish were landed with the rod as shown. Both pictures, (those with the five and twelve fish) are a one day's catch.

I must, in truth, say that such catches are hardly representative. We stayed at the Bay for four months and these two pictures are the best catches of the season. Taken as a whole our average daily catch was about one fish per day.

It may be asked: is this not being a game hog. I reply, no. It must be remembered that all these fish are destined to die in a few weeks. We disposed of our fish by giving them to the Indians, who smoke them, and use them as a staple article of diet. The Indians having found that the white men will fish for the love of it and are willing, yes, anxious to give their catch away, fish, themselves, very little and only when their potlatch, (gift) supply, falls short of needs. Thus do we cater to the laziness of the Siwash.

Lastly, I can promise a good summer of health-giving pleasures and sport to any who wish to spend August or September on either of the described or on the hundreds of other beautiful B. C. Rivers.

cottages may be rented. Again, no boatman is needed and one has merely to follow the crowd to catch fish. At Cowitchan Bay fishing may be carried on all day, though, as usual, dawn and dusk are the best. However the sweet-tasting silvery sea trout seem to have but little preference for time of day.

At Cowitchan, Tyee and Spring salmon are not often caught heavier than twenty-five pounds and the Cohoes average about ten pounds.

There are two schools of fishermen; the one use about one hundred yards of young rope and a Number 7 Stuart spoon or wobbler; the other using the same bait, but substitute a trolling rod and about three hundred yards of light line.

My illustrations show fairly well the tackle used, namely a Bristol steel trolling rod, three hundred yards of Cuttyhunk linen line and a Number 7 Stuart bait.

The picture showing my father with five fish shows the bait, reel and rod, with trolling tip. The centre fish is a Spring. Picture two shows my step-mother with a twenty-one pound Spring Salmon. The title picture, with twelve fish, of which three are Springs and the balance, Cohoes. The Springs may be picked

Salting, Smoking, Drying Fish

An Important Paper on Preparing Fish by Salting, Drying and Smoking That Should Be Carefully Followed Up By Every Angler.

ROBERT PAGE LINCOLN

IN one regard, especially, the near-to-civilization angler has a distinct advantage over the angler who goes far from home on his fishing trip, and is not satisfied unless he has wild woods and wild waters on all sides of him. The near-to-civilization angler is able, most of the time, to take care of the bulk of his catch, whereas the far from home angler is forced to catch but a few fishes, or consume great quantities of fish or throw two thirds of the catch away. It is sad to relate that the latter is mostly the case. Unable to resist the temptation the fisherman, far from home, catches as long as the fish will strike, and has use for but a few of that catch, and throws the rest away; or he cuts away only a portion of the fish, (the best part of it), and then passes on to the next one. As often as not the worst offender in this respect is the man who is absolutely averse to eating fish; he dislikes the taste of it; it does not go with him. But although he cares little or nothing about eating fish, you can always be sure that he loves to catch them. After he has caught the fish his interest dies down. It matters not to him what is done with the fish: "I had my fun catching it," is the usual plaint. I do not know where to place this breed of human beings, but they certainly come under the head of the destructive killers and have no place in the clan of Waltonians. A man who will fish just for the "joy" of killing, and then throw away fish, or disregard it, that man should not be allowed the privilege of fishing the waters of the country. I have noted fishermen some one hundred miles from civilization exhibiting in photos as high as fifteen large pike and muscallonge, the outline stating: "The Result of A Few Hours Fishing." What manner of use was made of this enormous catch I cannot see, but we must believe that most of it is thrown away to the winged creatures and furred marauders.

The near-to-civilization fisherman can possibly have no reason for wasting fish that he catches. He should arrange it so that every bit of what he catches is made use of. This does not necessarily apply just to these times of conservation, but for all times. Were an application of conservation applied

throughout our whole lives we would reach a stage of civilization hitherto unconceived. Fish, too, are so easily prepared and saved by salting, drying or smoking that every angler should be acquainted with the various processes. The fact that fish are improved ten fold by smoking them, for instance, should be a welcome fact. The catch you have made in the summer and the fall months can be preserved for the winter months, making a food supply that is appetizing to say the very least. It is a fact that there are many men who have little craving for a fish, (taken fresh from the water and prepared for the table), but who never have been known to refuse smoked fish. A fish smoked has always been considered in the same word with rare wines. It is a luxury; but unlike other things can easily be prepared by any person with a little labor, care and consideration. Comparatively few people ever partake of smoked fish, for the very simple and adequate reason that the smoking of fish has been considered something connected with the science of the fourth dimension.

And, too, it is amazing, when you stop to think of it, very few anglers ever dry, salt or smoke fish for future use. In European countries I know this is the common practice. In the Scandinavian countries fish are dried and smoked in plentiful quantities, enough to last through the whole winter. In fact the partaking of lutefisk, (Swedish for stockfish), is a national custom. These fish are caught by the millions and dried, and shipped all over the world. When the Swedish people come to America they bring the national custom of partaking of lutefisk with them, hence the heavy demand for this fish from the other shores. For years untold, the catching and drying of this unique fish for the American trade has been exceedingly great. No Christmas season in America, in a Swedish home, is complete without its stockfish, prepared as only a Swedish house-wife can prepare it. Ever tried it brother? Make the acquaintance of your Swedish neighbor; mention lutefisk, and the bars on friendship are down. It is the pass-word. If you do

not like lutfisk make complaints to this department.

In the Scandinavian countries, as I have stated, most all sorts of fish are dried; not to forget the *yedda*, (Swedish for pike), for it will be remembered that the pike is one of the most widely distributed fishes of the world. Yes, it is the same big fellow we often call the pickerel, pike or Great Northern Pike. And you can split and dry pike as well as the ambitious Scandinavians.

I do not recall ever having read more than one or two brief articles on salting, drying and smoking fish in the outdoor press, in all the years I have been conversant with that press—and mine is a powerfully active record in that regard. I feel as though I am attempting a new subject. You can take practically any fish, rough fish or otherwise, and smoke it, and its value as food is increased a great deal. In the late autumn you can, with permission, no doubt, net suckers, when they are firm of flesh and you will be surprised, after smoking them, how tasty they can be. Pickerel, pike, lake trout, any or all of them, they make a select table fare when fixed up by smoking.

There can be no doubt about it, the fish taken in the autumn of the year make for the best specimens when they are smoked or dried. It is in the autumn that the fish put on flesh, their muscles are firm, hence they are of far better eating than those caught, say, in the hot days of summer. It is the fish caught in the early part of the season and in the autumn that makes for the

best specimens which to smoke or dry for future use.

You can make your smoke-house very simply out of logs four inches through, set up and down, close together. In Figure I we show the smoke-house made out of these logs. This house can be seven feet in height and four feet square. The top is covered the same way. When making this smoke house, if you leave cracks here and there throughout the whole there will be no necessity of boring holes in the top to let out a portion of that smoke. The smoke, in the demanded measure, will escape through the cracks, while the bulk of it remains within, circulating freely, and densely. It is necessary in the log smoke house to have some sort of a door that will open and shut tight, which can very easily be done, without the least trouble. In Figure II we show a house that is made out of boards put up and down. If it is desired you can, of course, leave cracks between these boards for the escape of the demanded portion of the smoke, but if you should desire to put the boards close together then it will be necessary to bore or cut out some few holes at the top with a key-hole saw to let the smoke escape. Four or five of these holes about one and one half inches in diameter will be sufficient. In the case of the board smoke-house it is not really necessary to have a door as on the log smoke house. A twelve inch board, removable at any time will be quite sufficient.

Fish are smoked in one of two ways. The first manner is to have the fire at the bottom of the house, inside: but this method is to be condemned for the very simple reason that it entails a great deal of trouble, of taking care of the fire, of opening and closing the door, and is generally a disagreeable procedure. A few attempts at working it in that manner will suffice to have you change your mind and to look around for some more simple manner, that is thorough, and efficient. We have shown in Figure II a method of smoking that is, to say the very least, efficient and dependable, and is not in the very least disagreeable as you will prove to yourself when you try it out. A heater is used, the pipe of it entering at the side of the bottom of the house as shown. The house generally stands a little high, and the stove sits low, for very obvious reasons. And, too, it is necessary to have the pipe at the bottom so that the smoke will circulate freely from the very bottom, upward. In event that you are out somewhere and have to use more or less primitive methods

in constructing your smoke-house (as the one out of logs) then of course the smudge-fire can be made at the bottom of the smoke-house; in which case, of course, the door is necessary. But if you can obtain the stove as a smoke producer, all well and good, it is the very best, if used, as I have stated, and shown in the illustrations.

In Figure III we show the inside of the smoke-house.

It is very simply constructed. There are

cleats along the sides, as shown; these cleats are from ten to fifteen inches apart, up and down. Staunch strips of boards are cut to fit from right to left across the smoke-house, each end to rest on one of the cleats. You can have as many of these strips as you desire, for as many fish as you are to smoke. The fish are hung from these strips by connecting them to a wire, the wire to be hooked to the strip and thence around the tail, speared through the flesh. Figure III will show how the fish hang, with the heavier portion down, the tails up. In this manner you can hang up as many fish as you like, large or small, it does not particularly matter, as the dense smoke will penetrate to all of them.

Next comes the matter of making smoke, and what material to generate smoke from that will give the fish a taste that is appealing, for, it will be remembered, not all material will do this; some material will leave a bitter

taste and some a strong taste that will not leave the mouth. Anyone who has tried smoking fish with various materials knows this to be true. There are three materials that I know to be good, and one can follow these directions without fear of going amiss. These materials are:

- (1) Corn-cobs.
- (2) Birch bark, birch twigs, portions of birch saplings.
- (3) Cedar bark, and parts of cedar wood, saplings.

After a great deal of experimentation it has been found that the best smoke obtainable for smoking fish is from corn-cobs. Happily corn-cobs, (barren of the kernels), are comparatively easy to obtain and they give to the smoked fish a sweet, incomparable taste. Cedar bark for a smoke producer comes next, and birch, and birch bark third, because birch gives the fish a tang that some do not exactly relish.

You make your fire in the stove, after you have hung up the fish, and then you put on the bark, or the cobs, so as to form a smudge. The fire is not allowed to burn to the top to a glow, before it is covered again with cobs, to produce a rich smoke. The fish as they are hung up in the smoke-house are allowed to remain there through the day, but at night they are taken out and hung up in the fresh night air until the morning when they are again hung up by their hooks on the cleat strips in

the smokehouse and again smoked till evening. How long should the fish be kept in the smoke-house, is a question that may be asked at this point. And this, too, is important to know. Just how long the fish are to hang up in the smoke-house before finally

taken out for storing away depends upon your taste, of course. Some think a fish over-smoked if it remains in the smoke-house more than three days. Others prefer smoking the fish four or even five days. To suit your taste smoke some specimens three days and some four and five days, and then compare their virtues by tasting each. You can thus afford yourself of a happy medium by selection. Remember that every night you take the fish out and hang them in the open

Fig III

air. In the morning you return them to the house, to be further smoked. Before storing the fish for the winter they should be dried in an airy, dustless place and they should finally be kept in a dry, cool place, the reason of this being to prevent molding.

Before hanging the fish up to smoke in the house it is necessary that they be treated to a salt solution. Fish contain a certain amount of water, the same as flesh of all sorts. The more water there is in the flesh the longer it will take to get it smoked or dried as the case may be. Before smoking the fish, they may be dry salted, layer on layer, in a tub and be allowed to stand for from one to three days, or they may be placed in a pickle. I vastly prefer the latter now and so I will give here that method the preference. The pickle in which the fish are laid is composed of one pound of barrel salt to one gallon of water; the water is to cover the fish that you place in the tub. Before I go any further I may add a few words on how to clean the fish preparatory to putting

them in the pickle before smoking them. Without cutting the flesh any more than you are forced to, clean out the insides, the heads are removed, but is it not necessary to scale the fish, in fact most of the scales are left right on. When you have them clean, the fish are dipped into boiling hot water and then swiftly removed. Now lay the fish down in the pickle with the skin-side down, one on top of the other. Allow them to lay in this pickle for a matter of twenty-four hours, then take them out and wash them thoroughly clean for about a half hour in cold, clear water. When this is done, lay them on something to further drain off. When they are drained it is best to go over them with a dry cloth so there will not be any moisture adhering to them when you hang them up. Remember that it is an essential point that the fish be perfectly dry when you hang them up.

One woman speaks of canning such fish as the mackerel. I have never tried this. She says:

"Oily fish, like mackerel, are best soused, or pickled, and canned. When canned with a spiced sauce no salting is required unless preferred. The fish is cut into small pieces and cooked in the sauce gently for a few minutes, then neatly packed in jars and processed for two hours. The tops of the cans are then tightened and the process continued for one hour longer. The cans, after cooling, should be wrapped in dark cloth or brown paper bags and kept in a dark and cool place."

After fish have been smoked it should be remembered that they should be thoroughly dried, especially as to surface.

While in smoking fish it is not best to cut open any more than is necessary, when salting down fish, or drying them, a little more cutting is necessary. Says W. C. Kendall on salting fish when on your trip:

"When transportation is not a serious consideration, earthenware crocks make excellent containers, but for all-around convenience, everything considered, wooden containers, if not made of resinous wood, are preferable.

"Nothing excels a common firkin, which may be had in various sizes. It affords the advantage of a handle by which it may be carried or fastened to the carriers. Some boxes are sufficiently tight, or can be made so, to serve as temporary containers or an empty lard kit, tub or other similar receptacle may be used. There should be a tight fitting top or cover with any form of container. The

salt and other supplies may be packed in the container.

"The usual procedure is to split the fish down the belly to the vent, remove the viscera and cut off the head and tail; make a cut on each side of the backbone inside of the body cavity; cut the bone in two as far back as can be reached and remove the cut-off portion; then make a deep cut along one side of the remainder of its length and lay the fish open. The fish should be washed in salted water and the blood removed from the backbone or that portion of it which remains. If the fish is too large to go into the container, cut it into proper lengths.

"While the general treatment of all fishes is the same the various characteristics of fishes may indicate in certain cases some divergence from the general rule. It may be desirable to skin some large scaled, thick, firm meated fishes and cut them into strips of convenient dimensions.

"It would also save space to remove the dorsal and anal fins of fishes which have stout spiny rays, even if they are not skinned or scaled, the head severed and the backbone removed each side and close to the fin, having pierced the skin and the meat to some distance in order to remove the bones that extend into the fish from the spines and rays. Then grasp the posterior end of the fin and strip it out toward the head.

"Large, stocky fishes, like the carp, buffalo, drum, etc., may be skinned or scaled, the head severed and the backbone removed. Then cut lengthwise into halves and crosswise into sections to fit the container. The heads of small fishes and the scales of fine scaled fishes need not be removed, although if the heads are left on they should be split and the gills removed. Small fishes, such as the brook trout, cisco and small sizes of similarly shaped fishes, may be split along the back on one side of and close to the backbone. The backbone need not be removed.

"Small, slender fish, like the smelt and some lake herring, which need not be split, should be cleaned by drawing the viscera out of the body cavity as the head is severed or along the gills if the head is allowed to remain.

"The degree of nicety observed in dressing the fish, such as removal of fins, bones, scales, etc., depends wholly upon the judgment and inclination of the operator. For instance it is possible to trim the meat from close to the bones of some fishes so that scarcely a bone is left. This is recommended for such fish as pickerel and suckers. With a little prac-

tice it can be done with facility by splitting the fish along the back to the backbone, thence trimming bellyward close to the outer surface of the ribs; Sever the head and remove the viscera.

"Having prepared the fish in some such way as indicated, place a layer of salt on the bottom of the container, and on this spread a layer of fish, one deep, skin side down, tail or narrow end toward the centre of the container, previously having rubbed onto the meat side some salt, then cover these with a layer of salt and add another layer of fish, repeating the process until the container is full or the supply of fish is exhausted.

"The salt with moisture from the fish will make a strong brine in which the fish may be kept until required for use, if protected from heat. The temperature should not exceed 70 degrees F. A lower degree is safer. A piece of board shaped to fit the container should be placed on top of the fish and weighted with a clean rock."

The directions here given by Mr. Kendall, especially as to boning the fish preparatory to salting them down, also fits in well when preparing the same fish for drying. It should be understood that the salt brine used on the fish serves to sap the water from the flesh. If fish are dried without any salt upon them it will take a long time in comparison with the other method, in fact I have never heard of fish being dried without the salt treatment. When the fish are removed from the brine they are dried after being drained off. Then they are laid out on an incline of boards, etc., facing the hot sun. The smaller fishes such as the sun-fish and the bass dry very nicely. When the flesh is dried through and through, (so that it is perfectly stiff), it is taken away from the incline and stored away in a cool and dry place. When the dried fish is to be used it is simply soaked in water, under which process the flesh swells out and it may thus be prepared for the table same as any other way. Fish captured in the autumn become excellent when smoked or dried. Of course the smoking process leads in points of attractiveness and desirability; drying comes next and plain salting comes third. Fish that are plain salted down will last a long time if they are kept in a cool or cold place; though they will not last if allowed in the sun. Flies drop their eggs on unsalted fish even though a netting be stretched over them, from a height of twenty to thirty inches. dropping their eggs through the squares in the net.

But best of all is the smoking of fish. It

is a method that every angler should be conversant with. There is never a surplus catch but that it cannot be taken to the smoke-house and prepared for winter use in a manner

that is very simple. Any woman, or lad, can take care of the smoke-house, and large quantities can be smoked at a time, enough for the family and a few for ones' friends.

The Permanent Camp

In This Article We Tell How to Best Arrange The Permanent Wall Tent Camp, With Improvements That Are Distinctly Helpful and Efficient.

ROBERT PAGE LINCOLN

THERE are two ways of camping, recognized among outdoor people. One way is to camp out with a shelter tent, a light tent that may be carried in the form of a roll on the back over the pack-sack. The other form of camping is with a wall tent, and when set down the tent is called a permanent camp, for the reason that it is fixed at one spot for a matter of two weeks, three weeks or three months, or as long as the trip out, lasts. Of course a wall tent may be taken down and shifted from place to place, but ordinarily the wall tent is suitable to remain on one spot, permanent for the duration of the trip. The use of the light, (or shelter), tent, is radically opposed to this, as you can easily pick it up and move from place to place, squatting wherever night overtakes you. Hikers make use of the shelter tent, as do also the canoeists; and for the purpose it is of course hard to equal a light tent of the sort. But where two or three fellows wish to camp on one lake or stream the

whole length of time they are out, it is the wall tent that is the distinct means toward an end.

It is saying the least to remark that the average person makes a poor job of putting up the permanent wall tent camp. Usually it is not through carelessness, as that the person knows but one system and follows that without any attempts at ingenuity. To such this article should be a simple lesson easy to understand and follow.

If you will glance at Figure I you will note a wall tent set up in the average fashion, thousands of which you see in this shape every summer that you are out. The tent, as shown in the drawing, has its ridge pole, two up-rights with spike ends that fit through a hole in either end of the ridge pole. The tent has its fly, which is the protecting canvas and it lies right "smack-fit" close to the top of the ridge of the tent on top of the other canvas. Both the tent and the fly are guyed out with ropes along the sides and one rope

generally holds the tent tight in front, thus making a nice thing to trip and fall over some night when you go out to see if the stars are where they should be. Note the general appearance of helplessness about this tent, which, by the way, has been made from an actual tent. The sides of it sag, the corners are weak, and the canvas lies rotting along the ground. The reason of this sag along the edges is easy to understand. The guy ropes, pegged to the ground at the angle they are in, cannot lift the canvas up—it is quite impossible. To make an efficient job out of it, the angle of the guy ropes must be different.

In studying out a method to get around all of these things I decided, (1), to seek to get the tent stretched around the sides, and (2), to seek to eliminate the two uprights, the front upright at least being absolutely in the way; at the same time I wanted to eliminate the front guy-rope, and (3) I wanted above all things to get that fly canvas off from the other canvas. I had found that one canvas lying on top of the other caused the fly canvas to wear the tent canvas down thin so that finally it was useless along the ridge, and too, water stayed along the ridge, causing both canvases to rot. In the fourth place I wanted to get rid of the clumsy and inefficient wooden pegs which are nothing short of a nuisance; and I also wanted to get something more durable and lasting than the canvas loops through which these pegs were inserted. All this was a large bill but I soon got around it.

In Figure II we show a wall tent set up in a fashion making for an ideal camp.

The arrow (a) points to the main ridge-pole, and this ridge pole may be as long as

you wish the camp to be, which includes the additional canvas of the fly out in front and over all. The arrow (e) points to that fly as it canopies the front. Before I go any further I wish to state that this canvas out in front will have a distinct purpose. By making a framework around it as shown in the illustration, (ee), the front and the two sides down from the out-thrust canvas roof may be walled in with mosquito netting. A door frame can be made in front, also to be covered with netting. This front is more than a place where you can sit on the summer evenings and during the day, if you so like here you can do your cooking, and eat your meals if you so desire, and have the inner tent merely to sleep in. How long should this front canvas be? That depends entirely upon your desires, and how large your camp is to be. The smaller your camp the smaller may be your space in front. If your tent is 14 feet long, you may choose to have a fly thrust out in front of about eight feet. Of course, you understand that two flies are sewed together to make one long one. You are not liable to find a long enough ridge pole to go on through if you have a very long tent. Therefore an upright must be fitted in at the point, (bb), the two ridge poles meeting at that point, (the dotted line), above. However, if you do not wish to have a fly thrust out in front, (for a summer kitchen affair), you will find that one ridge pole will accommodate all. However, following the plan I have given you can make your camp any size and have perfect good luck with it.

The letter (d) within the two arrows shows the ridge pole that goes *inside of the tent*; and

the letters (c) and (b) are wires that connect from that ridge pole onto the main ridge pole. The space allowed between the tent ridge pole and the main (or upper) ridge-pole is six inches. Thus the canvas fly above entirely saves the tent underneath from the elements, and is truly a line of resistance, as well as protection. It will be noted that the fly thrusts out for about two feet *in back*. This I believe to be a great help, and an added protection, I believe that this should be kept intact when you arrange for your fly material.

You can pick up the material for these steel prongs in most any scrap pile; or the blacksmith will make them for you for little or nothing. Of course where transportation is a simple matter the inclusion of these steel prongs will not be noticed as to weight. A few of these steel prongs taken along on a shelter tent trip is just the clear thing. Sew steel rings around the edge of the shelter tent, too, and in a few moments with a hatchet they are tapped down and the tent is up.

Where you can have a board floor to the tent and the mosquito-netted-kitchenette, be sure to add this as it is most desirable. The floor need be lifted off of the ground no more than six inches. A board floor is very easily made.

In event that no board floor is used then have the floor canvas. It is vastly to be preferred that this is made of extra heavy ounce for obvious reasons.

In Figure III. we show the front view of the tent, illustrating how the uprights have been eliminated, and the six inch space between the tip of the tent and the top of the main ridge pole.

The usefulness of this idea of lifting the fly off from the tent proper I cannot begin to

enlarge upon. If you have tried out the old way to your entire "satisfaction", as I have, you will understand that the new way is the only way worth trying. If the rain beats down, say, the tent roof underneath is rarely wet, save in the ends, and this is especially true if the fly has been treated to some water-proofing solution, of which there are many methods. I will give one that has been tried out. You may know others, as I do.

You put a pan on the stove and melt a pound of paraffine as much as possible. Have a pail handy containing one gallon of gasoline. Pour the thin paraffine into this and mix it up. The paraffine solution need not be applied until the fly is stretched. The mixture may be poured into a sprinkler and thence sprayed out over the tent fly. To reach the top, tie the sprinkler to a stick and then see to that all points are covered. The gasoline of course is nothing but a carrier and soon evaporates, but the paraffine will sink into the canvas pores, closing them up and so making them quite impervious to the down-pour of rain. When applying the mixture the canvas should, of course, be perfectly dry. A hot day is the best to put it on, which, of course prevents the paraffine from hardening.

The good thing about a fly (thus made impervious to the rain) is that the tent underneath may be used for years and still be as good as ever. The rain rarely gets at it. It is safe from sun and rain. The open space between allows the wind to circulate through. On another point also the idea of lifting the fly off of the tent proper is a good one. If the fly lies right on the tent ridge the sun beats down on it and in the daytime it is quite impossible even to enter the tent for the heat. With the fly lifted up the sun

loses itself force against the fly, the result being a more moderate temperature.

Since the fly protects the tent in this fashion it is possible to get the tent itself in a light weight of ounce, and even muslin sewed into the form of a tent will so; will save you money; and will also be very cool, since a tent for summer use is not in demand as a heat-conveyor. Knowing that a muslin tent under a waterproofed fly (as I have

The guy-ropes from the tent to the side pole, should, when stretched, keep the bottom of the tent canvas well off of the ground; it should never lie on the ground. Therefore see that the cross pole, at the side, is high enough to allow of this being done. If the cross-pole is too low there will yet be a sag to the canvas. I have shown the two uprights holding up this side cross pole to be crotched affairs. If you have access to two by fours,

stated) is a most desirable thing I suggest that it be tried out.

I have shown the main ridge pole in Figure II to rest, at each end, in the crotch of a tree. In place of this it is possible to sink two poles of the right length to take the place of trees. Many are not so sure about setting the tent near to trees. If, therefore, you desire to have a free mind on that count, have poles instead of resting the ends on trees. However, small trees, six or seven inches in dia-

or some such sawed lumber you can make these uprights and cross-pole of that material. In any event do not attempt to drive them down with an axe, but dig holes and sink them down, then pack stones around them in the holes. These uprights should stand perfectly solid in the ground. It does not take very long to do this, and it is best to do it right. Remember therefore to cut your uprights long enough to give a length to properly sink them. The use of these cross poles at the

meter, are rarely hit by the lightning, as we know. It is the huge trees with air spaces in them, or hollows containing dead air that draw the lightning. Avoid placing the tent near any such huge or deformed tree, or attaching the ridge pole to any such a tree for very obvious reasons.

In Figure IV, we show how to take the sag out of the sides of the tent by raising the guy-ropes to a side pole at the sides of the tent.

sides on which to tie the guy-ropes does away with the clumsy method of pegging these numerous ropes to the ground.

I have previously told of the clumsy method of using pegs to peg down the tent around the edges and elsewhere. The average tent has canvas loops through which to thrust the peg, and so pin it to the earth. These canvas loops are childish and about as useless a thing as was ever invented. Remove these

loops and at that same place sew in, with waxed cord, steel rings one inch, or even less, in diameter; and sew them in good as they bear a quite a bit of strain. Now take three eighths inch steel rods and bend them as shown in the inset in Figure V, sharpening the ends a little so that they may be driven into the ground freely. Six or seven inches should be allowed for the length of these prongs. Figure V shows how these prongs are slipped through the rings and driven into the ground. If you are to have a floor canvas to the floor of the tent at this point you are

called upon to look into a neat system that is wholly efficient and trouble-saving. Note (b) of Figure V. The floor canvas is the exact size as the inside of the tent. Here and there sew in rings as you have done along the edge of the canvas, already told of, at the same point where the rings are situated outside, along the edges. When you prong down the outer rings, also slip the floor canvas rings on the steel prongs and thus when you drive down the outer rings you also seal the floor canvas down tight.

GUNS & AMMUNITION

Bullet Lubrication

R. E. HERRICK

"Sumpn' burnin' there"

"Look at 'em smoke"

"Whatcha got there, tracer bullets?"

These and other equally pointed remarks, and some considerably more pointed than polite were directed at the writer one Sunday last spring when he started shooting at 300 yards and when his bullets were leaving a curling trail of smoke along the line of trajectory, but we are getting ahead of our story.

We have experimented with bullet grease for years. Yes, started in on it in the good old black powder days, when a little beeswax and tallow or japan wax were all that was needed to lubricate the old "smoke wagons" but it is quite sufficient to say that quite a different prescription is required on the modern jacketed bullets that are at their destination and have the horses unhitched and turned out to pasture before the old soft lead slugs get the brakes off to start.

I've never liked the idea of forcing metal jacketed bullets through a choice barrel

without some sort of lubricant, for it doesn't take much thought to convince anyone that there is friction there, lots of it, and where friction resides there also resides erosion, and friction and erosion spell a short life for a barrel.

So we went to experimenting with greases and oils. Tried everything we ever heard of anyone using, and as many on our own hook. Of course we read the reports concerning certain old army rifle barrels that were brought back to a wonderful (?) state of accuracy by merely using lubricated bullets. That settled it. We would find a suitable grease if we never saw the back of our neck.

Mobilubricant was one of the first greases we ever used that seemed to carry the recommendations of advanced riflemen, but let me state here and now that in our estimation Mobilubricant is not and never has been anything better than a makeshift and leaves much to be desired. In the course of our experiments and inquiries we were

informed by a man who was in a position to know, that Mobilubricant was composed of tallow heated to just below the melting point and when the right temperature was reached a small stream of oil was fed into the tallow and all mixed thoroughly in great agitating vats. So then we have a resultant compound which has never been nor is it designed for use in intense heat, it being used in the transmission set on automobiles where there is little or no heat but where a thick heavy grease is necessary. Try melting Mobilubricant and after it cools it doesn't resume its former smooth state, but is a stringy, sticky mass of no use whatever.

We tried mixing air float graphite with it, but after a few shots with this one never knew when the bore was clean, for the rags kept coming black for a week. I don't doubt but that the graphite did noble service, but appearances are too strong against it for continued use.

Next we tried all sorts of mixtures of beeswax, Mobilubricant, cylinder oil, cornauba wax, and what not, all in the attempt to secure a grease into which the bullets might be dipped and which would harden with a non-sticky surface. We finally settled on a mixture of cornauba wax, beeswax and high grade auto cylinder oil, using approximately equal parts of cornauba and beeswax and enough of the oil to bring it to the desired degree of hardness when cold. In using this grease it was heated to a smoking point and the bullets dipped in it up to the mouth of the shell. As the cold bullets will take on too much of the grease unless they too are heated, we have a pan of boiling water at hand into which the bullets are dipped before their bath in the grease. We did our cartridges after they have been inserted in the clips, thus one dipping coats five bullets.

This grease worked nicely, and was the one used on the occasion mentioned at the beginning of this article, the excessive smoke being caused by a little too much grease. This is unnecessary. A light film of grease being all that is required to do the job of lubricating. We were well pleased with this grease and had several primer boxes filled with it at the 1918 National Matches, only to have to fall back on Mobilubricant on account of the order forbidding the taking of ammunition into quarters. We had planned on doping up our bullets before going to the firing line, but had to give that scheme up. We did shoot some of our own home loads one afternoon at 600 yards which had been

dipped, with the result that the members of the Indiana team, who were next to us, had some sport. "watching our smoke."

This grease presented only one fault. It appeared to us that a perfect grease should leave the bore slightly oily, or at least the muzzle of the rifle should be moist from the oil after firing. This final point was supplied by our friend, Lieut. E. A. McGoldrick of Spokane, who suggested using "F. F. Franklin" auto oil as a softening agent. There is not any set formula as to quantities, but by using about equal parts of cornauba wax and beeswax and just enough oil to soften the resultant product according to the season of the year it will be found after firing there will be a ring of oil around the bore of the rifle at the muzzle, which indicates that all the oil at least, has not burned, and not having burned it seems also reasonable to believe it has served its good purpose of lubricating the bore with some left over for good measure.

A word as to said F. F. Franklin auto oil. This oil is a Pennsylvania product and is practically the only oil that comes from the ground ready for use, i. e., that doesn't require refining before it is of any value to the consumer, and it is supposed to withstand a higher fire test than any other oil on the market. It is not used as a straight lubricating oil, however, being used as a blending stock to bring certain oils up to a required standard as to fire and flash tests. All auto cylinder oil manufacturers do not use this F. F. F. oil for blending purposes, but all do use similar products which they call "bright-stock," and are used in exactly the same way.

A batch of this grease properly blended, will stick to a bullet almost like paint, and will harden down with a smooth, glossy surface. Drop a clip in the sand; pick it up and blow the sand off and it's as good as new. I've carried cartridges so prepared in my belt until the grease had fairly worn off around the points of the bullets, yet the rest of the grease still stuck like a burr to a dog's ear.

Incidentally that is just one test as to when you have the grease of the correct consistency. Too hard it will flake off a bullet. Too soft and it won't have a hard, glossy surface. Sometime I'm going to experiment on a soft grease to use as one does Mobilubricant, but made from bees wax and "bright-stock."

Speaking of soft grease reminds me that I have a home-made bullet greaser that just about fills the bill. First I got a 1 oz. brass grease cup with non-rising screw stem and

ground off the octagon portion so it was flush with the barrel of the cup. Ground off the screw threads and soldered on a portion of a Krag cartridge case. And here comes the best part of it: In the open end of the Krag shell is inserted a Springfield bullet jacket, point down, and expanded so as to permit a loaded shell being inserted just up to the crimp. Bored a hole through the jacket point to permit the grease to pass on up, and made a slip cover from an old pistol shell and it

is done. The bullet jacket inside the greaser prevents too much grease getting on the bullet, and does spread it on in a smooth, thin coating. This greaser is clean to operate and as fast as any of this type. The accompanying sketch will show how it would look if cut in two through the centre.

There is no doubt about the value of a suitable lubricant on metal jacketed bullets, so we will not discuss this phase of the question except to give a warning against allowing grease to get in the chamber of the rifle. This does it no good and may do considerable harm and only requires a little care to prevent. This screed is merely to give other riflemen the advantage of whatever knowledge I have gained in attempting to develop a better lubricant.

Sights

P. A. L.

IN looking over the Lyman catalog of peep sights the reader wonders at the fact that these famous sights that have been on the market for so many years, with two or three exceptions, have but one adjustment, and that for elevation only.

Any rifleman that sights in a rifle knows that there is just as much need for side movement as for elevation.

When one attempts to drive a front sight over just a little, or shin up the side of a peep and try each shift by a few shots, he soon condemns the process as costly in ammunition, time and temper. He wonders why the makers only make half a sight while with a side screw in the side of the base of that sight he could have placed the zero anywhere he wanted it after firing the first group.

Different makers and even different lots of the same make of high power ammunition will shoot to a different zero. In using a sight with two movements, knowing your sight and pitch of screws, you simply shoot a group at a known range and by shifting your sight the required number of points you can place your zero anywhere you wish on the target.

At present I have a Remington .25 calibre that has a Lyman rear sight and a V. M. front sight. The front sight is a very tight fit. At present that rifle zeroes $1\frac{1}{2}$ inches to the right at 100 yards. I would give a good bit to have it shooting centre, yet I hate to at-

tempt to shift that sight, knowing that I might get out of the frying pan into the fire.

It may mean 100 rounds of ammunition before I get it correct and proved. The above remarks will also apply to the Marble sights. For best results these peep sights should be mounted to set about 1" in front of the eye when the head is in a normal shooting position. A sight mounted on the receiver is too far away from the eye for best results.

In bolt action rifles the sight should be mounted on the end of the firing pin and then it snaps forward and away from the eye when the rifle is fired.

As to front sights I prefer the V.M. sight for it gives the least eye strain of any sight I have ever used and is very accurate. The Marble people make the V.M. sight with a gold face but they would improve it greatly by making it a dead black face instead. The gold glitters whereas the dead black gives a well defined ring that shows clearly against all objects. Just smoke a V.M. sight with a match and see the difference. I have tried all colors and find the dead black far the best.

Many shooters think a very small bead sight is the most accurate. Such is not always the case as a very small sight strains the eye. A large sight of correct shape gives much less eye strain, therefore is more accurate.

The V.M. sight in conjunction with a peep sight gives no eye strain at all. It is simply a clear look through. Shooters with failing eye sight can get the best of results by the use of a V.M. sight when the ordinary sight would be a complete failure.

Will the Lyman people make their sights 100 per cent efficient or will they go on in the same old rut? True, they have two fine sights in the models 103 and 20½ but what about all their other models?

The Gibbs Optical Sights for Sniping Rifles

THE firm of George Gibbs, Ltd., of Bristol and 35 Saville Row, London, is responsible for a set of optical sights adapted for use with military rifles, unusually complete and refined in their mechanical construction and design. The backsight, as here illustrated, reproduces in general outline the aperture sights which were used before the war at Bisley and elsewhere in service rifle competitions. Fixture is effected by removing the long-range aperture sight stem and fitting in its place the more elaborated stem and overhanging cross-bar illustrated above. Two adjustments, wide in their range, are provided. The elevation adjustment depends upon the interworking of the upright square stem and the sliding sleeve which fits over the last named and carries the cross bar. The scale is graduated in minutes on one side and in hundred yard intervals of range on the other, both markings being clearly visible to the shooter when in the firing position. An adjustable index permits the zero of the rifle's shooting to be made coincident with the zero of the two scales. The cross-bar carries an ordinary aperture below and a lens aperture above, both forming part of a sliding carriage controlled by a screw. The index mark is scribed upon a separately

adjustable member, the shooting zero of the rifle being thus capable of adjustment laterally as well as vertically in respect to the other scale. The two apertures are distanced apart the amount by which the lens front sight is fixed above the ordinary rifle foresight. At the option of the shooter ordinary aperture sighting may be practised as an alternative to the use of lenses. The front lens fitting masks the ordinary foresight, but as it can be removed or replaced in a few seconds the change from one system to the other is very rapid. The presence of the lens and aperture backsight fitting in no way interferes with the use of the ordinary open backsight.

The foresight consists of a rigid frame carrying a screwed ring, into which the lens-piece is turned, a set-screw ensuring its retention in the position with the aiming lines upright. These consist of a vertical stem and horizontal line, as in telescopic sights used for military purposes. The particular form of base shown in the illustration suits the short service rifle. Two wide-spread hooks embrace the nose-cap fitting. The hooks engage with a special screw which performs the holding functions of the ordinary screw, but carries in addition extensions at either end adapted to engage the hooks in the sight

base. When the hooks have been passed over the pin extensions the final fixing of the member is effected by tightening the thumb-screw, so that its point presses firmly against the barrel. The pressure so exerted throws the fitting against the foresight block. In order that the position of contact shall not depend on chance an adjustable bearing screw is provided. This is set at the first fitting of the sight to ensure uprightness, and its adjustment is permanent so far as the particular rifle is concerned. The magnification of the lenses is $2\frac{1}{4}$ diameters, and the field of view is pleasingly large in consequence of the ample dimensions of the front lens. An effective light or rain screen is

available for the occasions when it is required. It consists of a thin sheet of flat spring steel which is pressed into a semi-circular groove formed in the top half of the front lens frame.

The fact that a set of sights, seemingly so simple in the essence of their design, can usefully carry so many important embellishments is a tribute to the importance of scientific rifle shooting and its intimate association with military problems. Whatever other results the war may have it should at least have harmonized all differences between the respective points of view of the soldier and the expert target shot.—(Reprinted from "Arms & Explosives.")

Queries and Answers

The Smith and Wesson Revolvers.

Editor, Guns & Ammunition, Dept.

By what company is the America revolver made and is there any firm in Canada handling them?

Do the Smith & Wesson people make a single shot pistol? What is their address and can a catalog be obtained from them?

Where could I buy second hand revolvers and address of party having same for sale?

At what distance will the .38 Smith & Wesson Special, 6 inch barrel, make good targets?

Inar Johnson,

Naughton Glen, Alberta.

Reply—The America revolvers that you refer to are evidently the Young America models made by Harrington and Richardson, Iver Johnson and Forehand and Wadsworth concerns. These were the cheapest revolvers made by these concerns. I would not advise anyone to purchase a weapon of these grades.

The Smith and Wesson certainly do make a single shot pistol, no better weapon has been made in this country. Address Smith and Wesson, Springfield, Mass. U. S. A.

You could buy second hand revolvers most likely if you knew of anyone that had one for sale. Advertise in *Rod and Gun*. That should put you in touch with a party that had one for sale. Buying second hand firearms is rather a risky business unless you have the opportunity to view your weapon before you pay for it.

The .38 Smith and Wesson special revolver will shoot with any revolver at 50 yards. At 100 yards it will do very good work and some

men have reported very good work at the range of 300 yards.

Editor.

Wants a Rifle for Deer Shooting.

Editor, Guns & Ammunition, Dept.

I have gathered together several of your magazines called *Rod and Gun* and it is the greatest book I ever read.

I am thinking of buying a rifle in a short time and do not wish to pay more than about \$30.00 for it. I want a gun for deer and that would kill a moose at 300 yards. I would like a carbine with a 20 inch barrel.

Do you think that a .44-40 or a .38-40 would be of any use? I am now using a .32-40 with a 28 inch barrel but it is old and sometimes it jams. The frame is pretty loose and it is worn at the muzzle. Would these make it shoot inaccurately?

I have a Stevens favorite .22 and the barrel is badly rusted and I cannot get it out. What shall I do with it?

Frank Bicknell,

Ontario.

Reply—For deer shooting the .32 Special Winchester, .303 Savage or a .30 Rimless Remington would all give you very good service. They would all kill moose very nicely if you hit them just exactly right but a moose at 300 yards is a pretty tough proposition and I would prefer one of the 1895 model Winchesters for this work. This rifle would cost you more than \$30.00.

Your present rifle that is loose is absolutely certain to be inaccurate so long as it remains

loose and if the muzzle is worn that is pretty certain to give the same trouble.

I would suggest a 24 inch barrel on the new rifle as being better balanced for a high power rifle.

If your .22 Stevens is rusted and scored in the chamber you can do nothing but get a new barrel and in that case you might as well get a new rifle.

Editor.

The Ithaca Gun.

Editor, Guns & Ammunition, Dept.

What is your opinion of the Ithaca Gun Company's taper choke boring system? Some people claim that it is bogus.

A. Ham.

Toronto, Ont.

Reply—I do not know of any better shooting shotguns than the Ithaca Guns. I had one with which I killed 24 straight gray squirrels and there was nothing bogus about the shooting qualities of that gun. I never saw an Ithaca gun that appeared to be a poor shooter, and I may add that I have seen many of them in use and have used several of them myself.

Just what system they actually use I cannot say as I never used a micrometer gauge on the bore of one but you can depend upon it that they will shoot all right. This is equally true of the other standard makes.

Editor.

Various Inquiries.

Editor, Guns & Ammunition, Dept.

Is the .38-55 High Power powerful enough for shooting moose, bear, deer, etc., using soft point bullets?

Are five shots at 20 feet that will all be covered by a Canadian five cent piece considered good shooting for a .22?

N. M. Taggart,

Colgate, Sask.

The .38-55 High Power would be a good rifle for your purpose but lacks the flat trajectory for long range shots that is an advantage in using the .30 and .32 calibre high velocity rifles. Up to 150 to 200 yards it will do very nice work. Over that range you will have trouble from over and under shooting.

The shooting mentioned as having been done with a .22 would be good offhand shooting but would need to be about three times as accurate for fine target shooting.

Editor.

Information on Winchester Products.

Editor, Guns & Ammunition, Dept.

Do the Winchester Repeating Arms Co., still make their model 1886 in the .50-110-300 W.H.V. calibre?

What does the letter H stamped on the back of Winchester rim fire cartridges mean?

Is there a 12 gauge lever action shotgun on the market today? If so, by whom is it made?

Do the Marlin Repeating Arms Co., still manufacture rifles?

Have you any information as to the calibre, ballistics etc., of the German "anti tank" gun?

How should the .32 Special Winchester be reloaded to give the same ballistics as the .32-20 Winchester H.V. cartridge?

R. L.

Montreal, P.Q.

Reply—I believe that the Winchester Repeating Arms Co., has totally stopped making the .50-111-300 calibre rifles. They might be able to tell you where you could get one however. Address them at New Haven, Connecticut, U. S. A.

The letter "H" on the backs of the rim fire cartridges is the Winchester "trade mark" that they use on the rim for ammunition they make.

There is no 12 gauge lever action repeating shotgun made at present in America. The Winchester Repeating Arms Co., formerly made such a weapon and still supply a 10 gauge in that style.

The Marlin Arms Co., was entirely taken over for making machine guns during the war and I have not heard that they have yet begun to make sporting arms. Whether they will do so you could discover by addressing them.

I have not seen very much about the Ballistics of the German Anti Tank gun but I did see a bullet that was used in one of them and it certainly was a business-like looking bullet. It was a square base, boat tailed shape and appeared to be jacketed by some BRASS composition, but most likely was some copper alloy that I was not familiar with, but which did look more yellow than copper color. I did not have a micrometer at hand to measure the bullet and did not weigh it but it certainly looked like the daddy of all high power rifle bullets.

To make a .32-20 out of a .32 Special, use a light bullet and a small load of Du Pont number 80 powder or Hercules Sharpshooter

The Old-Timers are Back at the Traps

Whether you are an "old timer" or just one of those who have always had a desire to break into the game, get busy this year, for this is trap shooter's year. It's the year when the "real man's sport" is coming back.

Get out into the open and try your luck at the clay birds—the sport of sportsmen that knows no game laws. Shoot with the old-timers—get out with the men who have played a bigger game "over there", for they are among the trap shooters. Take your "better half" with you for this is the sport of women too.

After you smash your first bird—well, you're a life member of this great sporting fraternity,

Make this life membership one long, sweet dream of satisfaction by being sure your ammunition is right.

Dominion Shotgun Shells

are the correct trap loads for old-timer or novice. Canuck, Sovereign or Regal are dependable, accurate, and fast—and they pattern right.

Canada's long run record at the traps—203 breaks consecutively made—is held by Dominion Canucks.

Dominion Cartridge Co., Limited,

Montreal, Canada.

or Unique. See Ideal Handbook for the many possible loads.

Editor.

Wants a New Automatic Rifle.

Editor, Guns & Ammunition, Dept.

I sometimes get hold of your magazine and noticed some time back a gun of the self loading class and would like to know if there is anything new out in the line of automatic rifles as I am beginning to think about getting a new gun? The one I am using is a .35 calibre Browning automatic. If you could give me any information I would be very pleased.

James Greenaway,

Chase River, B.C.

Reply—I do not know of anything later than the Remington autos and the .351 and .401 Winchesters. Possibly you are thinking of an automatic rifle that Mr. Fred Adolf had in mind but which was never manufactured.

Both the Remington and Winchester companies make .22 automatics as well as the larger calibres.

Editor.

Various Inquiries.

Editor, Guns & Ammunition, Dept.

I have a Remington model 12 repeater, .22 calibre and the barrel of same is pitted. I had the barrel leaded out at the factory but it is still slightly pitted.

In an article in your magazine I noticed that it said the pits filled up with lead and destroyed the accuracy of the gun.

If this rifle is kept properly cleaned and a Marble's brass pull through used to prevent the lead forming will the accuracy still be affected?

What would be a good set of sights for this rifle to be used for hunting and ordinary target shooting?

Is there any difference in accuracy and power between a Remington model 12, .22 with a .22 inch round barrel and the same rifle with a 21 inch octagon barrel. Is this rifle capable of making half inch groups at 25 yards?

How should a rifle be tested for accuracy? Do you know where I could secure a Savage model 1914 twenty-two and the probable price? Is this rifle more accurate than the Remington model 12, .12?

W. A. Donahue.

Sarnia, Ont.

Reply—Your .22 rifle would likely group into a 2 to 3-inch bullseye at 50 yards judging

by your description of its present condition. It will never be as accurate as when new and will always be hard to keep from rusting due to the presence of the depressed pits which cannot be removed because they are BELOW the surface of the steel. I would advise a new barrel or a new rifle. Lyman number 2A and 5B or Marble rear peep and gold bead front, practically similar combinations so far as results are concerned.

The Remingtons with 22 and 24 inch barrels would be equally accurate but the 24 inch barrel handles the best, balances the best and can be held steadier as it is heavier. Practically speaking it would be more accurate in ordinary shooting although the barrel itself would not likely be any more accurate. These rifles will occasionally make $\frac{1}{2}$ " groups at 25 yards.

A rifle is tested for accuracy by machine rest, by prone shooting with sling, or by either a sitting or prone rest. Resting across a table that has a box on the front end, a small platform etc., would show you how the gun was grouping.

The Savage and Remington .22 repeaters should be equally accurate and are just about equally desirable. Try Hallam's or Lion Sporting Goods Co. that advertise in *Rod and Gun*. They may have one still on hand.

Editor.

He Wants a .22 Repeater for Small Game.

Editor, Guns & Ammunition, Dept.

I am in need of some advice that I think you can supply me through your queries and answers column.

I would like to buy a .22 repeater or auto-loader and do not know what make to buy. Could you enlighten me on the subject?

Which make and cartridge is the best for small game shooting, has the most killing power and what powder should it be loaded with?

Which are the best sights for hunting and what would be the price of the rifle you prefer?

L. Wilkins.

Toronto.

Reply—I would advise a model 1914 Savage, a model 12C target grade Remington or a model 1897 Marlin in .22 long rifle calibre. In a more powerful cartridge I would advise a model 1892, .25-20 calibre Winchester. I would advise a .22 long rifle repeater in preference to the .22 automatic as the cartridge used is much cheaper, is more accurate and

DOUBLE the number of your happy vacation hours with a "Liberty" Daylo

Avoid vacation accidents, increase comfort and pleasure

CANADIAN NATIONAL
CARBON CO., Limited
Toronto, Canada

*The light that says
"There it is!"*

in hollow point form is if anything a better hunting cartridge.

Select the Lesmok or Semi-Smokeless long rifle cartridges and use them exclusively. The .25-20 Winchester is a mighty fine little game rifle but costs more to shoot than the .22's.

Both the Winchester and Remington .22 autos are good little guns but I prefer the ordinary repeaters with their longer barrels, cheaper price and cheaper ammunition.

Good sights are Lyman or Marble peep tang sight and a medium size gold bead front sight.

Which of the rifles to purchase depends upon personal tastes as all of the above are of about equal quality and worth.

Editor.

Sights for a .303 Savage.

Editor, Guns & Ammunition, Dept.

I have a .303 Savage rifle of 1899 model and would like a little advice on sighting it. The sight that is on it has a windgauge and I think is the one on it in the picture (in the catalog) and the notch in the sight is so fine that I cannot see through it on a cloudy day in the brush. Also there is a trap for the brush to catch in and turn it up and knock it out of line.

This rifle shoots about 6 inches high at 100 yards at present, using Remington U.M.C. ammunition, and about 12 inches low using Dominion Cartridge Co's. ammunition. Do you have any trouble or complaints about Dominion ammunition?

If you can inform me about the best kind of sights I would be very grateful.

Ottawa.

W. H. C.

Reply—What you need is a Lyman peep sight on the tang. I have the same trouble in using open sights. Write to the Lyman Gunsight Corp. Middlefield, Conn. U.S.A., who will tell you how to get a tang peep for this rifle. Better order a gold or ivory bead front as well while you are at it.

Your rifle is evidently sighted for about 260 or more yards with Remington U.M.C. cartridges. With Dominion cartridges you would need to change the sighting. This seems to be a very extreme case of difference of barrel time and flip due to different lots of ammunition unless you have in some way been shooting Dominion cartridges that had gone bad from some unknown cause. I have not had any complaints lately about Dominion cartridges giving trouble of this kind.

Editor.

Notes on the .303 Ross.

Editor, Guns & Ammunition, Dept.

Some time ago I purchased a .303 model 10 Ross rifle weighing around 8 pounds and the barrel looks as if it had been cut down to 26 inches. What do you think about accuracy as per cutting down of barrel and the qualities of the rifle as a whole?

Where can I get reloading tools for same and what bullets to use of light weight with a small powder charge to use shooting partidges and rabbits and also practise target shooting. I want to make it an all around gun and have cheap shooting.

L. P. Prouty,

Montreal.

There may be various reasons for your Ross rifle appearing to be sawed off. I believe that some Ross rifles are cut off square without reaming out the muzzle, at the factory. Also if it has been cut off since leaving the factory it will not hurt the accuracy if the job has been done correctly. If not have a gunsmith cut off a fraction of an inch to square it up and remove any burrs. Then the rifle should shoot as accurately as ever.

The Ideal Manufacturing Co., New Haven, Conn. U.S.A. manufacture the only reloading tools made in America for reduced loads. They make a .311 bullet similar to the 125 and 154 grain .308241S. bullets for the Springfield rifle. This bullet is for the .303 Savage but you could use it in the .303 Ross for real short range like 50 yards or so. Use 6, 8 or 10 grains of Hercules Unique or DuPont number 80 powders behind this bullet cast 1 to 10 and resized to .311. For partidge it would be apt to mangle somewhat if you tried to load heavy as it is pretty close to the .32-20 cartridge for power. Depends upon the powder charge in these reduced loads.

Editor.

Wants a Crow Rifle.

Editor, Guns & Ammunition, Dept.

I have read Rod and Gun in Canada a great deal. I would like to ask you a few questions about crow shooting.

Is a .32 calibre rim fire strong enough to use on crows? Where can I get a reliable crow call? Is it necessary to use decoys with a call? We have many of these pests around here and I want to thin them out.

Beverly Scott,

Westmount, P.Q.

Reply—I would suggest the .25-20 and

DU PONT CANADIAN INDUSTRIES

Off For The Club

Vigorous red-blooded Canadians who appreciate the outdoor life know the value of a trap shooting club to any community. They know that nothing on earth will do more to develop keen eye and a steady hand, than a few hours a week at the traps. Join a gun club in your town and keep fit. You will like the game and the fellows too.

SPECIFY "DUPONT" LOADS. THEY
ARE QUICK AND SURE.

E. I. Du Pont De Nemours & Company
WILMINGTON, DEL. U.S.A.

DU PONT

.25-35 as being much better crow rifles than the .32 rim fire. The latter lacks both range and accuracy. It has plenty of power. What you want are flat trajectory over 150 yards and the finest possible accuracy. The .22 High Power and .250-3000 Savage are superior for long shots but cost much more to use.

W. J. Taylor, Ltd., Woodstock, Ont. can supply a Perdew crow call for about \$1.00 that is as good as can be secured. I have used the Perdew call for possibly 15 years and know what it will do.

If you can secure a stuffed owl stick it up on a pole or dead tree and hide close by with a full choke 12 bore shotgun loaded with duck loads, and you will get the crows. Use the long drawn out 'CAW' 'CAW' etc., to start them in your direction and the sharp piercing 'HAWK' 'HAWK' cry of the crow when they get near. They will swoop and then you get in your shooting. For rifle shooting over a decoy let them settle and then pick them off. But, don't let them tear your decoy to pieces. I have shot dozens of them with a call without any decoy. I prefer the shotgun for calling and the rifle for shooting them on the snow in the winter, feeding, loafing in woods etc.

I remember that my brother once called a hunter over half a mile to kill a "crow" that was calling and when he found that he had been "sold" he enjoyed the joke just as much as we did.

Editor.

Various Questions.

Editor, Guns & Ammunition, Dept.

Does one injure a rifle like the .303 Savage by firing the .32 revolver cartridge in it using the Marble auxiliary chamber. I wish to do considerable shooting and which do you think will suit me better, a .22 rim fire or something larger like a .32 center fire and for me to reload the latter?

What is your opinion of the Marble Game Getter and do you like the Marble flexible rear sight with the number 2 disc and the Lyman number 4 front for a hunting rifle?

Why is it that all of these front sights are made so high? I have a King triple bead and a Lyman hunting front and with either of them I have to elevate the rear sight so as to hit center at even 50 yards and they are both for the .303 Savage. Which do you consider the better for failing eyes, the white or the red bead?

J. A. H.

Reply—You should have no trouble with

the revolver cartridges in the Marble's Auxiliary chamber if you only use a few and the rifle is well cleaned each time but—they will not begin to compare in accuracy with reduced loads in the .303 shell.

You do not say what you will use the rifle for but would judge that the .22 long rifle repeaters like the Remington 12C target, the model 1914 Savage or 1897 Marlin, would suit you very much better than what you have mentioned—providing of course that you are not going to shoot big game with them.

I do not know why so many front sights are so high. May be that you have a very low shooting rifle. May also be that your rear sight is too LOW. I would consider an ivory or "gold" bead as being the better.

Editor.

Information on the .25-35.

Editor, Guns & Ammunition, Dept.

Could you kindly tell me the effective range of the .25-35 Winchester repeating rifle model 1894; its striking force at 200 yards, and also its velocity? What is the largest game that it can kill regularly?

Vivian Bartram.

Toronto.

Reply—Ballistics are as follows: Muzzle Velocity 1978 f.s. at 200 yards it is 1420 f.s. Muzzle Energy 1017 ft. lbs. At 200 yards, 516 ft. lbs.

I would consider that its effective hunting range was 200 yards and its effective target range was 300. It will do good work at longer ranges under favorable circumstances but will not compare with more powerful cartridges at the longer ranges.

At 200 yards the cartridge is one of the most accurate in existence.

I would consider that the gun lacked power for anything larger than deer. Penetration is about 12 inches of pine with a soft point bullet. Penetration in pine tells practically nothing in regard to game shooting.

Editor.

A Reply to a Criticism.

Editor, Guns & Ammunition, Dept.

I am somewhat surprised to read the criticism of the brief article on machine guns, by one Capt. F. G. Wheeler, in the March number. I have before me very complete data on the various machine guns and inventors thereof. Even if I did write that the Gatling was used by England in the Egyptian campaign in 1882, this does not by any means assert that the Gatling had not

PARKER BROS., Master Gun Makers **Meriden, Conn., U.S.A.**

New York Salesrooms, 25 Murray St.

been used by them before in their Eastern campaigns. But, it is a fact, that the first important land operations in which machine guns were used by the British forces, were those of the Zulu war of 1879.

A small number of Gatlings were used by the Army. These were of the same model as had been used by the Navy for a short time before. Gatlings were used in the relief expedition of Ekowe and in the fight at Ulundi in Zululand. But, the report also states, that the guns did not prove entirely satisfactory.

As to the Vickers and Maxim machine guns:—I have good complete drawings and descriptions of these guns of the latest models. I find that the name of Vickers is generally applied to the light model and the name Maxim to the heavy model gun.

As far as I can see from the drawings, the principle in both guns remains the same, though some parts of the mechanism have been altered and strengthened for the use of the modern high velocity ammunition.

It is a fact that since 1893 the Maxim gun has undergone some changes in construction. The weight has been reduced and better material used.

Other countries that have changed their Maxim guns are, Italy, Switzerland and Germany. But, they have all stuck to the Maxim principle. As to the bore, lands and grooves; they must be made to conform to the use of the new high power ammunition with its steel and cupro jacketed bullets.

As to the nationality of Hiram Maxim. Hiram Stevens Maxim was born in Sangersville, Maine, on Feb. 5th., 1840. His ancestors came to the English Colonies in America about 1650 and settled in Plymouth Co., Mass. They fought in the Revolutionary war on the side of the colonists against England. Later on they settled in Maine, at Wayne, Kennebec County. Still later on, his father moved to the town of Sangersville, Maine, a frontier settlement in the big woods. After leaving home Mr. Maxim found suitable employment in a machine shop in Fitchburg, Mass., and he later worked in other Eastern manufacturing establishments.

Mr. Maxim took up his residence in England about 1880, to avoid what he claimed to be unfair treatment accorded to him and his inventions by the Government of the United States.

I believe that this will explain Hiram Maxim's nationality.

St. Paul, Minn. U.S.A.

P.T. Streit.

Editor, Guns & Ammunition, Dept.

I wish to purchase a .303 British. Kindly let me know the length, weight, price and number of shells it carries, also where I can purchase one.

H. D. Williams,

British Columbia.

Reply—The Winchester Repeating Arms Co., New Haven, Connecticut, U. S. A. will be glad to advise you the closest market for the purchase of a .303 British Winchester. It is the only rifle made commercially at present for this cartridge.

The rifle has a 28 inch round barrel and the carbine has a 22 inch round barrel. The magazine holds 5 cartridges in this calibre. It is a box magazine, lever action sporting rifle. It is very reliable in action.

The Ross Rifle Co., used to make a .303 British straight pull bolt action rifle that was well thought of by those who like a bolt action rifle but I believe is not being manufactured at present.

Editor.

Concerning the .38-72 Winchester.

Editor, Guns & Ammunition, Dept.

What is your opinion of the .38-72 model 1895 Winchester as a deer rifle and how does it compare with the rifles of the .30-30 class for deer hunting at ranges up to say 200 yards, and is it a better rifle than the .38-55 smokeless? Do the Marlin and Savage people make a rifle to handle the .38-72 cartridge?

J. Doherty,

Belleville, Ont.

Reply—In reply to your inquiry the .38-72 Winchester should actually be a better killer on deer at say 100 yards than the .38-55 low power or High Velocity (so-called) or the .30-30, as the bullet would strike about the same blow but would penetrate more evenly on rear end shots than the others, due to the longer heavier bullet, but on longer shots it would be outclassed on trajectory and also on accuracy by the other two. The rifle is heavier and meaner to carry on the hunting trail due to the box magazine being exactly where one wants to carry the rifle. The model 1895 Winchester is the only repeating rifle made for this cartridge and that is now no longer made for it.

For deer shooting, cartridges like the .303 Savage, .32 Special Winchester and Marlin, .30 or .32 Remington rimless and the .33 model 1886 Winchester are much preferable to present day hunters as their trajectories are flatter, the rifles that use them are nicer

to carry and use, the cartridges weight less etc., but for actually putting down running deer that are in brushy country, and most of them are, I am sure that the .38-72 and .40-72 type of rifles would be more certain on rear end shots at short range. Many use the .35 and .405 Winchesters for just exactly the same reason. If you want a large bore, and a model 1895, try one of the latter for making a sure thing out of a gamble like deer shooting.

Editor.

Wants a Deer Gun for a Settled Country.

Editor, Guns & Ammunition, Dept.

What kind of a gun would you think proper for deer in a settled country?

What kind of buckshot would you think best for a 12 gauge shot gun used for deer? What is the killing range of buckshot in a full choke 12 gauge gun?

William Kruger,

Rockingham.

Reply—I would consider rifles like the .32 Special Winchester or Marlin, a .303 Savage, or a .30 or .32 Remington auto as being the most generally satisfactory for your purpose.

Try putting a wad in the muzzle of your gun and trying different sized buck shot until you find a size that fits evenly in layers at the smallest portion of the muzzle. I would consider 40 yards as far as you would be likely to kill deer except by accident when using buckshot. Depends altogether where you hit the deer, what kind of ground you are on, whether you use dogs to follow it or not after it is hit, and whether you have snow to track it by.

In Pennsylvania we are not allowed to kill deer with buckshot as it is not sportsmanlike and dangerous. In New Jersey, which is the next state and has deer hunting in exactly the same kind of country they are not allowed to use *rifles* for the same reasons. Some people use salt or silver bullets as being more certain to get results and as less dangerous to everyone concerned. Also less trouble. I was with two men on a grouse hunt once and we walked within 15 feet of a buck in the open season before he got up and stood and looked at us and we had SHOT in our guns. He got away before we could change to solid ball. Never saw a prettier buck either.

The use of buckshot in deer shooting is certain to result in the loss of many crippled deer. Personally I think it is nearly as sportsmanlike as shooting squirrels with a shotgun.

Editor.

Why are the .38 Special and the .44 Special Popular?

Editor, Guns & Ammunition, Dept.

Why is it that all of the expert revolver shots use a .38 cal. or larger for target practice and in shooting for records? I ask you this question because I have never received a satisfactory answer from anybody and I have often wondered why the .32 calibre is not used in preference to the .38 or the .45 calibres. I mean, of course, for fine target work.

From ten to thirty yards, or I might say up to 50 yards I believe that it should hold its own. Of course I realize that the ordinary .32 calibre revolver is too light to do good work with, but there are three models that I know from personal experience have all the weight necessary. Namely, the .32 calibre Smith and Wesson heavy frame target revolver model 1911, the Colt Police Positive and the .32 long Colt Bisley model single action.

Since you are undoubtedly familiar with all three why is it that one of the three is not used for target work instead of the heavier calibres? I have a .32 calibre-Bisley model with 6 inch barrel and it will shoot straighter than I can hold and I am a fairly good shot.

Which of the three models would you choose? I have always thought that the .32 Smith and Wesson model 1911, with 6 inch barrel a prettier gun than my Bisley model but I am used to the Bisley model and for several reasons feel towards it the way you regard the Colt .45.

Hoping for an answer as to whether the .32 is as accurate as the .38, I am,

Dr. H. V. Hight,

Sherbrooke, Que.

Reply—The reason that practically all of the target cracks use the .38 Smith and Wesson or .44 Special cartridges is because they are generally regarded as the two most accurate revolver cartridges. I believe that no other revolver or pistol cartridge has equalled their accuracy except our old standby, the .22 long rifle, and that when shot in a pistol.

Many men use the larger calibres solely because they cut a larger hole in the target. At 20 yards this is quite an item on line shots. Capt. T. K. Lee uses a .44 Special for this reason principally, so he has told me, and he has made several worlds records and several scores that were higher than existing worlds records but were not allowed due to some technicalities.

Another reason is that a very large number of special target bullets have been designed

and made for these two calibres. These bullets cut full size holes in the target. This is not so true of the .32 calibre cartridges and having cherries made to order for newly designed bullets is an expensive business as you will find if you ever attempt to get any new designs made up.

My own choice would be the .38 S. and W. Special ctg.

Editor.

A Few Scores Discussed.

Editor, Guns & Ammunition, Dept.

My hobby is the rifle. I do love a good rifle. The first occasion I ever had to use one was when I was about 17 years of age and I shall never forget it.

The rifle was a borrowed .44-40 and a good one. The target was a cow that I was commissioned to dispose of and which was securely tied to a tree at the edge of our swamp. The range was about 20 yards. Three shots were fired and then, owing to prevailing circumstances the range was speedily reduced to about 5 feet and one shot completed the job.

Upon examination I found one hit and two misses, the result of the three shots at 20 yards. I have no means of verifying the above so you will have to take my word (We will friend, without a doubt, Ed.) that it really happened.

For the following, some years later, I'll refer you to the records of the Ontario Rifle Association. On August 20th, 1913, at the Long Branch Ranges, Toronto, in the MacDonald Match, in which the target at 500 yards, remains exposed for one and one quarter minutes, the writer scored 5-5-5-5-5-4 for seven shots, hand loading.

These two incidents go to show what practice will do. I am a farmer and I really never did much practicing, not having the time and no long range to practice on.

I firmly believe that good shots are made and not born. I learned to shoot straight and quick, by following the instruction of an old hunter and trapper and were I capable of writing it properly, it would, I am sure, be of much benefit to many sportsman who are not satisfied with their present marksmanship.

M. Sherin,

Omamee, Ont.

Reply—I thoroughly agree with you that a shooters' ability depends almost altogether upon his own efforts, providing of course that he has no physical afflictions that make it impossible. I have proven it so in my own

experience so thoroughly that I am firmly of the belief that a poor shot never deserved anything but condemnation for his own laziness. I believe that shooting ability, if eyesight and nerve control are not hopelessly lacking, to be merely a result of practice and brains applied in the right direction in the right way.

Editor.

Wants a Rifle for the Rockies.

Editor, Guns and Ammunition, Dept.

Will you please tell me what you think of the .250-3000 Savage rifle to carry in the foot hills of the rockies in Alberta for an all around rifle? I have a .303 Ross model 10 and do not like it as it tears coyotes and wild cats too much. I want a rifle that will do for anything from a moose to a coyote.

B. R. W.

Sask.

Reply—The .250-3000 Savage would be a very good all around rifle but it would certainly tear coyotes and wild cats just as much or more than the .303 British unless you use the spitzer bullet load in the .303.

I would consider the .250-3000 much too light in the bullet for grizzly bear but any .25 calibre rifle would be too light for me for grizzlies. I would think that the .25-35 Savage or Winchester or the .25 Rimless Remington would suit you very well, but it would also be too light for grizzlies. Your best bet would be to reload your .303 using Lightning or DuPont number 21 powder, for a mid range load in the .303, and then that gun would do for all of your shooting.

Editor.

Some Questions to be Answered.

Editor, Guns & Ammunition, Dept.

I have been a reader of your magazine for many years and during that time I have accumulated a bunch of questions to be answered.

I have a .25-20 Winchester repeating rifle model 1892. Can you suggest a good sensible set of sights for same? Where can I obtain them?

Do you consider this rifle powerful enough to kill deer?

Would it pay to reload my own shells for this rifle? I have had no experience along this line so please give me the list of tools and supplies that I will need and the price and where I can obtain them.

I am thinking of buying a repeating shotgun this summer, to be used in hunting ducks,

B.S.A. RIFLES

of Yesterday

IN the good old days before
the War, when men shot
game instead of enemies, Am-
erican sportsmen swore by the
B.S.A. rifle.

The unique B.S.A. "Lever
cocked" air rifle and the
B.S.A. .22 calibre target and
sporting rifles, famed for their
intense accuracy, were par-
ticularly favored by American
rifle connoisseurs.

During the War one great American
munition maker used B.S.A. .22
rifles exclusively in testing daily
output.

The War enhanced the already
splendid reputation of the B.S.A.
for reliability, accuracy and power
(when power was wanted). Mil-
lions of B.S.A. rifles were made for
Allied land, sea and air forces.

It was the amazing B.S.A. ex-
perimental work and machining
skill which made the Lewis machine
gun the wonderful weapon it turned
out to be.

The B.S.A. of today is the result
of all the years endeavor that have
gone before, and first fruits of gruel-
ling tests of the great War. See
our announcement next month.

Write for further information and
rifle booklets sent free upon request.

**THE BIRMINGHAM SMALL
ARMS COMPANY, LIMITED**
Dept. 12, Birmingham, England

partridges, prairie chickens, squirrel and rabbit. What gauge and make would you advise?(I am 15 years old.)

I am also thinking of getting a .22 repeater for small game. What make would you advise me to get?

Jack Kelly,

Ponoka, Alberta.

Reply—Lyman number 1A and 5B. Marble peep tang and gold bead front. Lyman Gunsight Corp. Middlefield, Conn., U.S.A. The address of the manufacturers of the Marble line of sportsmen's specialties is Gladstone, Michigan.

The .25-20 will kill deer if you can hit them right. I would prefer a much more powerful rifle.

It would certainly pay you to reload your own cartridges if you do much shooting. Ideal melting pot, dipper and stove lid. Ideal number 3 tool with double adjustable chamber for bullet number 25720. Bullet mould 25720, 77 or 86 grains. Bullet resizing chamber. Ideal powder measure number 5, with .25 calibre drop tube. stick bullet lubricant, 5 pounds lead, ½ pound block tin, can powder adapted to that rifle, 500 primers, 100 empty cartridges. A good hot coal fire, or gas fire, a willing mind and the ability to stick to it until you succeed. Get the Ideal handbook and read it five times before you begin. Then go to it, and—keep water out of the melted lead.

Try Weber Arms Co., Denver, Colo., and Wm. R. Burkhard, 143 E. 4th, St. St. Paul, Minnesota, for reloading tools. Ideal people seem to be not making them just now.

Get a Winchester or Remington 12 gauge modified choke repeater or 16 gauge Winchester full choke.

Remington model 12 or Savage model 1914, chambered for long rifle cartridge. Use nothing else in that rifle. Get peep sights on it.

Editor.

Wants a Reduced Load.

Editor, Guns & Ammunition, Dept.

I bought a .25 calibre pump action model 14, Remington repeater and I find it is nearly as strong as my .303 Savage. Could I get a less powerful bullet and where?

What is the velocity and energy at 100 yards?

What is a good all around make of shot-gun for ducks? Give make and gauge.

J. A. Bertram,

Peterboro, Ont.

Reply—You can reload with the 101 grain spitzer bullet and a light load of DuPont number 80 or Hercules Sharpshooter powder. Can also use a lighter load of Lightning or even 21. You cannot buy a less powerful factory loaded shell for this rifle.

The velocity of the present load at 100 yards is 1812 f.s. and the Energy 854 ft pounds, when using the 117 grain bullet.

A good all around duck gun would be a full choke, 12 gauge Winchester or Remington repeater or any one of the double hammerless guns made with full choke 30 inch barrels and to weigh 8 pounds.

Editor.

Getting a Krag Carbine.

Editor, Guns & Ammunition, Dept.

I am in need of some advice as I need a rifle for big game.

I can purchase two .30-40 Krag carbines and in looking up the ballistics on different rifles I think the smashing power of this gun is about right but I know nothing of the action or the recoil. Is it a bolt action?

H. E. Tammerman,

Welland.

Reply—The Krag carbine will make you an excellent rifle. It has a bolt action, and is the fastest bolt action I have used. The rifle, or rather carbine, balances very well for offhand work. Its worst objection is a rather poor pull, in many cases. The recoil of the carbine is about the same as the Springfield rifle so far as the feeling of it is concerned. Foot pounds of recoil is misleading, and cannot always be relied upon. Whether a gun has a mean recoil or not depends mostly upon the fit of the stick and how you hold it.

Editor.

APPRECIATED IN ENGLAND

Writing to a contributor in Saskatchewan, an English admirer of *Rod and Gun* states:

"Thanks for *Rod and Gun* received a few days ago. I found the entire magazine of absorbing interest. In fact some of the articles seemed too good to be true, to one who has never been outside the confines of this small island."

Away up in the Highlands of Ontario is the Algonquin Park. Two million acres of virgin territory containing within its borders over fifteen hundred lakes. This is the canoeist's paradise for it is possible to paddle for fifty miles and from one lake to the other without any land portage.

Canada is starred with many beautiful lakes, all offering ideal holiday grounds for busy city folks. Here is a view of Cache Lake, Algonquin Park, on which is situated the Highland Inn.

'Lunge and Bass

Superlatively fine 'lunge and bass fishing can be had at a large number of points in Ontario along the line of the Canadian Pacific Railway. Season opens June 16th. Lake trout, pickerel and pike are also plentifully distributed.

Point au Baril and other premier fishing grounds in the Georgian Bay district, French River and the Lake Nipissing waterways, Trout Lake, Lake Penache, the Kawartha Lakes, and Trent River are amongst the attractive localities conveniently and quickly reached by the Canadian Pacific.

A. O. Seymour, General Tourist Agent, C. P. R., Montreal, will gladly give you further particulars.

1918 Deer Hunt of the Granite Hill, N.B., "Boys"

R. T. MORRISON

ALL the spare moments I had in the week previous to Nov. 17th, were taken up by such things, as looking over my rifle to see that it was in good condition, packing ammunition, hunting axe, compass and other necessary things to the big game hunter of New Brunswick, and last but not least the reading of several copies of *Rod and Gun* to put a keen edge on for the annual hunting trip of the Happy Hooligans, consisting of we four brothers, Chester, Almon, Harry and Russell Morrison of Granite Hill N.B. and our jolly uncle and cook Edward Moise of Lakeville, Carelton Co., N.B. Bright and early on the morning of the 17th found the four brothers with a team packed with our camping outfit and necessary amount of provisions ready to make a start for our hunting grounds on the Cokiok and without delay we proceeded to Allendale Station, a distance of fifteen miles where we were to be met by Uncle Ed. who was coming on the nine o'clock train, but as we were delayed an hour or more on the way on an eleventh hour business call we were about twenty minutes too late to be there when the train came in. As we rounded a turn about a half mile from the station we sighted something that looked like a man and some boys playing football, but as we drew nearer we found it to be uncle, who was trying to carry three large boxes, a telescope valise (that was packed so full that the top and bottom parts did not meet by about six inches) a rifle, and a few other things too numerous to mention; apparently he was not calculating to carry this very far alone when he made up his outfit. After a hearty handshake all around we turned our team and took another road, went about a mile and stopped for about an hour and fed the team, also made some tea and had dinner, after which we went a couple of miles farther and made arrangements with a farmer to take care of our horses as we were to leave the settlement at this point and proceed in the woods for another three miles and as we had no hovels for horses they would have to be left at the settlement.

We were fortunate in securing a Mr. Adams who went the whole way to our camping grounds with us and brought out the horses. On our way in we saw plenty of

signs of both moose and deer also two bear tracks which helped to encourage us. At about 2.30 o'clock we arrived at our destination and as we were to use a tent for our camp we set to work at once pitching one which was 10 x 14, a very nice size indeed. While the rest of the boys were at work getting the necessary poles for erecting, Chester and I started making a berth across the end, raising it up off the ground about 18 inches as there was about 4 inches of snow and a great deal of dampness in the ground.

By four o'clock we had everything in readiness including supper and as it would be quite a while before dark, it was decided that we would all go out to the burnt land which was not far off and see how things looked. After getting there we stationed ourselves at different positions along a swamp armed as follows: Chester with a .256 Newton, Almon a .250 Savage, Harry and Ed. each with a .30-30 Winchester and myself a .22 high power Savage. I had not been sitting long before I heard something making a noise on the crust a short distance away on the other side of a little knoll from where I was, and after working my way around as quietly as possible I soon saw a large doe feeding along the edge of a swamp in some small willow bushes. Putting the rifle quickly to my shoulder I fired fully expecting to have steak for breakfast. Oh what a treat and so soon too, but not so, she made for the swamp on the jump followed by another bullet. She was out of sight for a moment but soon appeared with a partner just as large going at about a two minute clip. I fired twice more at them through bushes without stopping them. I was soon joined by Harry who was not far off and had come to see if I had run out of ammunition or anything. I soon told him what had happened and we both went over to where I had fired at them and found traces of blood showing that I had not made a miss altogether. They went a short distance and parted. We each took a track which we followed for sometime but as the bleeding had stopped and dark was coming on we made for camp where I had to take such things as, "It is too bad somebody hadn't been there to shoot those does etc." But bed time soon came and we all turned in after putting some wood in our little airtight stove

New Method Without Drugs

COURAGE NEVER FORSAKES THE MANLY MAN

The attached coupon entitles you to one illustrated copy of my pocket compendium and guide for the self-restoration of lost strength. (See description below). Upon hearing from you, this valuable little book of private information for men will be sent by return mail in plain, sealed envelope. Please call or write to-day.

There is a new and marvellous method for restoring lost manly strength, for renewing vigor, which every man should know of, a self-restorer which operates without the use of drugs or medicines, a new way to treat yourself for your ills and weaknesses. See description below.

Please remember that a man is not one day older than he actually feels, and therefore no matter what your age, if you are young or elderly, married or single, large or small, if I can show you, reader, how you, yourself, may actually add to your system, nerves and blood the very nerve force or vigor which may have been drained away, and

which is necessary to make you strong, vigorous and capable again, then I have shown you the real secret of perpetual strength, and how you can again be filled with vigor, and again be just as powerful in your influence and just as thoroughly manly in your capacity as the biggest, fullest-blooded, most successful fellow of your acquaintance.

The new self-treatment for the restoration of manly strength, to which I refer above, is a little light-weight VITALIZING Appliance of my invention, which is now meeting with a tremendous demand, and being used by men everywhere all over the world. This little VITALIZER, weighing only several ounces, is comfortably buckled on the body and worn all

night. It is so small and so compact that even a room-mate would not suspect that you were wearing it. If, however, this VITALIZER is small in size, it is not small in power, for it generates a great tangible FORCE, which can be measured on scientific instruments a POWER which I call VIGOR or NERVE ENERGY, and it sends this marvellous FORCE into your blood, organs and nerves while you sleep. All you have to do is to lead a decent, manly man's life, free from excesses and dissipation, then use the VITALIZER, nothing more. If this is followed out and the VITALIZER does for you what these others say it does for them, then all the pain or weakness will disappear from the small of your back—possibly from the first night's use—and you will be restored to a strong, vigorous, manly, capable man, without a single ache, pain or weakness. Please remember, I am not asking you to buy one of these VITALIZERS, but merely request you to first send for the free book described below, a section of which is devoted to an explanation of this VITALIZER, and gives you its whole wonderful story, so that you may know what intelligent young and elderly men everywhere are saying about it.

This Is the Book You Get Free

My 86-page illustrated booklet (pocket size) was compiled by me to answer fully and correctly those questions which are asked privately by any man needing new strength and who seeks personal advice pertaining to the ailments and weaknesses he wishes to overcome. The book, fully illustrated, with photo reproduction, contains much that a single or married man should know. It also fully describes my VITALIZER and tells how you may secure one to use in your own case, should you decide you want to use one. Remember, the book is sent absolutely free in plain sealed envelope. Why not write for a copy to-day? Satisfaction guaranteed in every case.

R. G. SANDEN CO., 140 Yonge St., Toronto Ont.,

Dear Sirs—Please forward me your Book, as advertised, free, sealed.

and getting some wood ready for morning. It was not long before all were asleep enjoying the nice bed we had made of fir boughs blankets etc.

About an hour before daylight everybody was astir helping with the breakfast—as we wanted to get an early start in the morning. I might say before going farther that our hunting grounds consisted mostly of burnt land with every little way a hard wood hill that had missed the fire, with here and there a small swamp. About gray daylight we all started out in the burnt land, Ed. and I together on the right and the rest going off to the left. We did not go far before we came to the conclusion that we had better separate as the country was open and we were making too much noise. We had not done so more than fifteen minutes than off to my left I heard four shots winding up with a good big whoop. What that whooping meant I did not know, as I thought sure it was Chester and I knew he would not whoop unless he had shot a bear, as that was his greatest ambition. However I thought I wouldn't be of any help as there must be plenty over in that direction and I made my way on between two burnt knolls. Just as the sun was making its appearance I caught sight of a big cow moose coming up out of a swamp looking back as though something had startled her. She soon was out of sight leaving me looking in hopes a bull would follow suit but in that I was disappointed and again made my way on for a short distance and stopped and looked around for awhile. I saw something resembling a stump and was only convinced that it wasn't when I saw a tail wiggling.

I fired twice at him, a distance of about 200 yards before he bid me good-bye and went the other way. I went over as quickly as possible to where he had stood but could not see him for a moment or so, when I heard something walking down in a little run of alders and on looking closely I made out my deer walking out the other side. I fired twice more before he fell and when I got to him he was in a bunch of bushes laying down but otherwise looking very life-like. As I did not want to spoil his head for mounting I fired once more in his shoulder without any effect. Bang! Bang! Bang! three more in the same place and he is still looking at me. Right then and there I cursed that gun from the word go, as by this time I had found out it did not have the power for this kind of game. However after another shot in the butt of the ear he was mine after a long fought battle.

I made for camp, mad at myself for coming in the woods with a gun like that. On the way I heard a deer call and on looking around I saw a yearling doe, which I will not say anymore about, but leave her wherever she may be in the woods, or in a frying pan.

When I got to camp I had some dinner and waited for the rest to arrive. I had not long to wait before Almon came and said that he had seen the biggest buck that ever stood on four legs and was coming right along his way when I started the bombardment and turned him. I expect it is a good thing for me that I did not know his thoughts at this time. We were still talking over this when along comes Ed. and Chester and anyone would not have to ask "Did you get anything?" if they had seen Uncle for there was a very broad smile on what he calls his face. We were not kept very long in suspense however before we had his story. As a kind of introduction to this man I might say that he is an extra good shot at a target but on previous occasions when he sighted game he developed a very bad case of buck fever. Therefore we always jollied him about his shooting qualities etc., which he always took in good part and would most always have a come-back. He said, "Shortly after I left you Russell, I was stopped eyeing things pretty close, when out stepped what I just took to be a moose about 75 yards away but I soon saw that it was an enormous buck deer. I began firing at him and between shots found myself saying, 'mind your sights Edward my boy, mind your sights for you must get that deer,' and on the fourth shot down he went."

That was the whooping I had heard and he had a perfect right to do so for he had shot a deer dressing over 200 lbs. with a set of antlers that would make one sit up and take notice. After we all congratulated him he said "Well boys as this is the first time I have ever got anything since hunting with you fellows I suppose its up to me to treat." So in the tent he went leaving the rest of us kind of clearing our throats etc., but instead of carrying anything resembling a bottle he holds out a package of fancy seeded raisins. Imagine the laugh we had over that. However he said "I'm not the only pebble on the beach for here is a man," turning to Chester, "who can speak for himself all right." So we listened to him tell a story of killing a 160 lb. buck and seeing two or three others.

"Well boys you're all here are you?" This from Harry who came strolling in and of course all the stories had to be told again

Vacation in the Pine Scented Lakelands of Canada

In the "Highlands of Ontario," that wonderful region of scenic beauty, you can Fish, Swim, Golf, Canoe, Camp, Hunt—spend a vacation you will never regret or forget. Mirror-like lakes set in the grandeur of forests of pine and balsam. The purest of air, 1,000 to 2,000 feet above the sea, and hay fever is unknown.

Famous Playgrounds for Outdoor Men and Women

"Algonquin Park"—"30,000 Islands of Georgian Bay"—"Kawartha Lakes"—"Muskoka Lakes"—"Timagami" and the "Lake of Bays." Modern hotels—or "rough" it if you prefer. Any Grand Trunk Agent will gladly plan your trip for you.

TELLS HOW FAR YOU WALK

THE AMERICAN PEDOMETER

Regulates to Step and Registers Exact Distances; Simple, Accurate, Durable.

Indispensable to every lover of outdoor sport and especially to those who love WALKING. Instructive because of value in determining distances; a necessary adjunct to compass and as useful to SPORTSMEN. It furnishes the true solution of many a disputed question of how far it is to or from various points. Best of all it is a wonderful health promotor because its interesting notations afford real incentive for WALKING. Whether you walk for health, business or pleasure—anywhere, everywhere—the AMERICAN Pedometer tells the whole story of just how far you have travelled.

one at a time and all together not even thinking to ask him if he had shot anything but when he shoved his hat back another notch and spit twice we knew for sure we could take time to listen all right. "Well sir" he said "I sure had some sport this morning—didn't go over half a mile when I saw a big buck running to beat the deuce. I fired at him though and down he went, a dandy big fellow with a bullet through his heart so I did the necessary surgical work and went on a little farther and saw another one running up the side of a hill through some bushes. I fired twice at him but didn't make a hit so I made up my mind I would wander back to camp, and got about a quarter of a mile when I came onto three cow moose quietly feeding away on some willow bushes. I stood looking at them for quite awhile when out strolls a bull to be made acquainted with a bullet from "kill deer" (his rifle) and the best of it is he fell in exactly the same spot as the one I shot last year so there will be no extra swamping to do. This completed the day's sport and if I were to give in detail the

next two days' hunt I would be taking up too much space in this valuable magazine so will just say that the next day sees Almon with a deer to his credit and myself with a nice 200 lb. buck with 8 points, and the third day as follows Ed. with a good big moose, another deer; Chester, a buck dressing over 175 lbs.; Almon a big doe; Harry also secured another buck which he dragged about a mile over a very rough country which was no easy task as it weighed 160 lbs. The fifth day we all turned to except Harry who went for the horses and swamped our game out so that we could get at it with our wooden sled that we had made. That night Harry took out one load of game to the settlement and stayed all night out there but appeared early in the morning for the last load and after packing everything all on we bid the dear old spot good bye hoping that we all might be spared to return another year.

In due time we arrived safely home and on taking stock we found we had two moose and ten deer, eight of which were bucks.

This is a panoramic view of the wonderful Tonquin Valley in Jasper National Park, Alberta. The man who took this picture has unequalled knowledge of the scenery of the Canadian Rockies and he states that the Tonquin Valley is the scenic marvel of all that wonderful territory. Although not seen in the picture this valley includes among its peaks Mount Edith Cavell, the great mountain named after England's martyr nurse.

Hardy's The Great British Specialists In "Palakona" Regd. Split Bamboo Fishing Rods

THE "DE LUXE" ROD, made of Steel-hard "PALAKONA" is Hardy's latest design in single-handed rods for wet or dry fly fishing.

IT is the product of the largest, and best equipped factory, supervised by the champion Professional Fly Casters and Anglers in Europe, "Hardy's." Don't forget that as wages in Great Britain are 75% less than in America we can give greater value in high class hand work. All our rods are hand made by experts whose lives have been spent at this work, for which 50 GOLD MEDALS have been awarded. Length 9-ft., weight 5¼ ozs.; 9-ft. 6-ins., weight 5¾ ozs.; 10-ft., weight 6 ozs. All fitted with Hardy's patent screw grip reel fittings.

DRY FLIES—As made by us for the late F. M. Halford Esq., for whom we also made rods, etc.

GUT CASTS—The Anglo-American tapered mist color No. 1 medium, No. 2 fine, as made for Mr. Halford.

Stout to 4X Ditto, Ditto to 3X, Stout Lake to fine, Ditto to medium, Ex-stout to MEDIUM, Ex-stout to stout, 6 ft.

We will be pleased to quote prices on receipt of inquiry.

Attracting Wild Fowl

Address Delivered by Mr. Jack Miner at the Commission of Conservation Meeting held on February 18th, at Ottawa

Mr. Chairman, Ladies and Gentlemen, I assure you it is a privilege for me to meet with so many bird lovers. We love out-of-door creatures, or we would not be here this morning.

Now, you will have to pardon my lack of education. I am one of those who was born bare-footed and educated out-of-doors. However, I was father's favourite. Perhaps it is not just the proper thing for fathers to show partiality, but mine did. He always called me in the morning to build the fires; possibly in that way I got out a little earlier than the rest to hear the birds singing.

Outside of unavoidable sadness, my life has been one continuous round of enjoyment; the failures and disappointments and the dark storm clouds have been wiped out of existence by success, by out-of-door life—a light which has brightened my path right up to the present and given a faint glimpse of the beyond. I have heard people say that they read that there was never a tribe of heathen discovered on earth who did not worship some kind of god. No intelligent man can live out-of-doors without being compelled to believe that there is an over-ruling power.

God created the fowls of the air, and so on, before he created man, according to Genesis, 1st chapter and 21st verse. Then in the 26th verse we find these words: "And God said, 'Let us make man in our own image, and after our likeness, and let him have dominion over the fish of the sea, and over the fowl of the air, and over the cattle, and over all the earth,

and over every creeping thing that creepeth upon the earth'." Does that mean that we are to have dominion over these big flocks of wild geese, so far away that you have to look twice to see them? You know how high they sometimes are; you can just hear them. That is what it says, gentlemen. Then we read further in Deuteronomy, chapter 22, 6th and 7th verses: "If a bird's nest chance to be before thee in the way in any tree, or on the ground, whether they be young ones, or eggs, and the dam sitting upon the young, or upon the eggs, thou shalt not take the dam with the young; but thou shalt in any wise let the dam go, and take the young to thee; that it may be well with thee, and that thou mayest prolong thy days." But, if a duck lit in one of the rivers here, all of us educated people would rush down—there would be ten guns out there to shoot it. Reading in the book of Job, we find these words:

"No doubt but ye are the people, and wisdom shall die with you. But I have understanding as well as you; I am not inferior to you: Yea, who knoweth not such things as these?"

"But ask now the beasts, and they shall teach thee; and the fowls of the air, and they shall teach thee."

When the first barn swallows came to our tile shed, on our little farm at Kingsville, Ont., they nested 300 feet away—as far away as they could get from where we were working. We protected the swallows from their deadly

Jack Miner: An Old Honker in the Back Ground

enemy, the sparrow that man brought to Canada—the English Sparrow—not the one that God put here, don't forget that. They destroyed the first brood, but we protected the swallows, and consequently the sparrows didn't destroy any more. Remember, the shed had stood there for ten years, equally as inviting. The second year there were two nests; the fifth year there are twenty nests in the tile shed, and, instead of being as far from us as they can possibly get, fifteen out of the twenty nests are within twenty feet from where we are working. They have come to us for protection, you have to believe that. They destroy large numbers of house flies. The ladies say—of course, the ladies never tell what is not true—that there is not more than one house fly now where there were five previous to the coming of these barn swallows, purple martins and so on. Scientists tell us that the typhoid fly will carry that deathly disease, and if we preserve the swallow which destroys these flies, surely it will be well with us and we will prolong our days. We protected one nest; now one hundred swallows are raised in that shed every year.

Now, what good is the robin? Everybody knows the robin. A boy came along the road with a .22 rifle, saw a robin sitting on the

fence, and killed it. I went over and picked the robin up. Two cutworms were squirming on the ground; the robin had had them in his beak. I held the bird up, and two more fell out of his mouth. Remember, one cut worm will cut down five tomato plants in a night. This fellow does his work and then hides under the soil; Mr. Robin comes hopping along, picks in there and pulls him out—and turns him into a robin. If anyone tells you that a robin will destroy one hundred cutworms in a day, take it from me that it is true. The morning after this boy promised me that he wouldn't shoot another robin, at the fir tree by our house were two little robins dead under the nest and two in the nest just alive. We took them into the house—it is wonderful what an effect a little bird can have on our

family. One bird will stop a whole plantation; I have known a wild duck to stop the whole brickyard. However, we took these two robins in, warmed them up, and made some custard for them—one egg, half a cup of milk, no sugar. They couldn't open their mouths, they were so nearly gone. We took one of them, pried his beak open and dropped in some custard, and the first thing we knew he came to, and in a minute or so began to squeak for more custard. The other little fellow was supposed to be dead, but he, too, soon began to look around, and these two robins became the sweetest birds we ever had on the premises.

You know how a door will slam once in a while in the house. Well, there was a good slam one morning, when someone had left the screen door open and Jasper's pet robin—Jasper is our son—had come in and was resting in what we call the cold storage—a room in the front of the house which is sometimes called the parlor. Here was the robin on Jasper's mother's picture, and the broom was going smartly after him. Jasper came with a tin, the robin flew into the tin and the boy carried friend robin out to safety. That is how we get enjoyment out of these things.

Do birds come back to their homes?

EVINRUDE

Detachable Motor for Watercraft

With an Evinrude you can go quickly, without rowing, to the holes where big catches are almost sure. Distance makes no difference to an Evinrude owner.

Variable speed, suitable for trolling. Swift, smooth, flexible power for canoe, rowboat and other craft.

Built-in flywheel type magneto. Automatic reverse. Maxim silencer and tilt-up arrangement if desired. Our special method of balancing practically eliminates vibration.

Nearly 100,000 Evinrudes have already been sold.

The Evinrude is used by 25 governments.

Robertson Bros. Foot of Bay St. **Hamilton**

How many times I have been asked that question. "Oh yes, they do come back." "Well, how do you know, Jack?" Then you would have to talk about the weather—to switch the subject. But I will tell you the rest of the story.

I hatched four wild young mallards—well, I didn't hatch them; I stole the eggs. A domestic fowl eventually hatched out four little wild ducks, and there they were, under the old hen, wilder than park hares. However, the old hen's voice soon brought them out, and several little girls began to come out from under their stepmother and look around, and eventually they would take some of the custard right in my presence. These ducks soon were so tame that the tap of a tin would bring them to you. They got to be quite a size, and we named them, respectfully, Polly, Delilah, Susan and Helen, and presented each one with an aluminum tag, on which was printed the words, Box 48, Kingsville, Ont. When autumn came the four ducks migrated—that is, on or about December 10th, 1912. Dr. Rutherford of Chatham, shot one, Helen at Mitchell's bay, Lake St. Clair. How they got to the east of us I don't know, for they started south. I guess they had taken such a liking to me, that they started for Ohio, where I was born. On March 14 1913, Polly came home. On March 18, Delilah came home, and on March 30, Susan, although wounded in the wing and foot, returned home. Is that not an answer to the question, do birds return to the place from whence they migrate? Well, I wanted to go down, hitch up the self-starter, and go to town, so that someone would ask me, "do birds return home?"

They migrated that autumn, and on March 14, 1914, Polly came home. On March 21, Delilah came home for the second time. The two girls raised families the next year,—and, by the way, they brought a Yankee sweetheart with them; and it is interesting, when they are arriving, to see the ducks come down and try to coax their new mates down too.

Well, they migrated again for the third time. In the spring of 1915 Delilah got home first; she arrived on March 13, and Polly came home on March 16. Polly had got her beak a little too far ahead and a shot had grazed right across it and cut the side off, leaving it hanging. She would just stand around with her mouth open. I got some porridge and mixed custard with it and the second day I had Polly in my right hand. In a week or so I took these ducks to a photo-

grapher, stood them on a table, brushed them down and talked to them quietly and got a photo of them.

We often make remarks about silly old geese and silly old ducks; sometimes I wonder what the ducks and geese are saying about us. These ducks have shied around to keep clear of people hiding in ambush for them; then they come home and in a few days are eating out of our hands. Isn't that worth thinking about? Talk about loving these birds; you simply can't help it, if you are human. Polly said: "I am going to stay with you, Jack, from now on," and she stayed in the hen house with my birds in the winters of 1915 and 1916. However, in the spring of 1916 she got shot, but Delilah migrated and got back on March 5, for the fifth time; migrated again, and got back in 1917 on March 25, and last spring she came back for the sixth time on March 19. Do birds return to their homes? I know that it was the same tag she had on, because my wife and I took it off her leg after it had been on five years, and we presented her with a new tag. I am now making my tag system a little more interesting, by putting on the blank side a verse of scripture. Everybody who brings down a goose with my tag on it gets a verse of Scripture, whether he needs it or not. Mack Stewart, of Tennessee writes: "Send me the history of this bird or any other Canadian bird." Corporal John R. Smith writes: "White, age 23, still unclaimed can you help me out?" So I took the two letters and handed them over to the ladies in our Sunday School, and the same day one of them came back. There are ten of us in one class, and we went and stamped this on our tag, "Let us consider one another"—Hebrews, 10, 24.

Now, where do these ducks go?

"Ask the beasts, and they shall teach thee; and the fowls of the air and they shall tell thee."

I have caught and tagged 287 wild ducks. My home is on the north shore of Lake Erie, due north of Pelee Island, twenty-six miles southeast of Detroit, at Kingsville, Ontario.—well I am a little way out of the town. Kingsville is the place where more fowls go than anywhere else in North America, I believe, the fowls of the air, it is their choice. I have twelve tags from Ohio, due south of me; nine from Kentucky, nine from Tennessee, leading right on to the gulf of Mexico, and seven from Alabama. I have one from Saskatchewan, one from Alberta and several from Manitoba.

NEWFOUNDLAND

A Country of Fish and Game.

A Paradise for the Camper and Angler.

Ideal Canoe Trips

The country traversed by the Reid Newfoundland Company's system is exceedingly rich in all kinds of fish and game. All along the route of the Railway are streams famous for their SALMON and TROUT fishing. Also Caribou barrens. Americans who have been fishing and hunting in Newfoundland say there is no other country in the world in which so good fishing and hunting can be secured and with such ease as in Newfoundland. Information together with illustrated Booklet and Folder cheerfully forwarded upon application to F. E. PITTMAN, General Passenger Agt. Reid Newfoundland Company, ST. JOHN'S, NEWFOUNDLAND

I have only four or five tags from west of the Mississippi. I have them as far east as Long Island, New York, as far west as Alberta, far south as Louisiana and as far north as Sault Ste. Marie. I haven't a tag for a wild duck north of Sault Ste. Marie, although I know that they go beyond there.

I have nine tags off the wild geese from Chesapeake bay, seven from North Carolina, one from Maryland and one from New Jersey, but none between my home and that southeast coast of Chesapeake bay. Do these wild geese come clear over to that Kingsville pond without a stop?

No, they stay with me about two months. They come about the first of March—in fact, the earliest we have had them is February 20 and the latest, March 16—and stay until the last week in April or the first of May. We have 25 tags returned from James Bay and Hudson Bay, and only one from the west side of James Bay, which is Albany, and 24 have come from right along the east coast. Those 25 tags, ladies and gentlemen, are in my possession and I am sorry that I didn't bring them along. The Indians shoot them and take the tags to the Hudson's Bay Company agent, I suppose through curiosity, mostly, and the agents eventually return the tags. I have 25 out of the 102 that I put on; 25 have been returned from there and only 9 from the south.

How did we find out about these wild geese? I have gone five miles from home before the stars closed their eyes in the morning. Wild geese are quite scarce; I went four mornings in succession and never saw one. There I lay under a blanket, just as the stars were closing their eyes, with three or four wild goose decoys out. Suddenly, at daylight, I see friend wild goose coming, bringing his family with him. I can just see the tip of the wings begin to move—a faint hum, coming closer. Everything is pretty quiet—but my heart sinks; here are two men coming out there in the next field. It's all off; those fellows will secure the geese. But no, that old leader goes right over them—now he has passed them. There I am under the blanket—possibly it is a sheet if there is a little snow on the ground—the three corners are tied down and I am underneath it, just hidden there, with a gun ready. And the leader swings around, and as he swings around, he calls and starts to drop his big black feet to come down. But for some unaccountable reason he changes his note and climbs into the air—everybody

look out for himself; and the minute he changed his note they all darted in as many different directions as there were geese—it was the danger signal. What did he see? He didn't shy from the other fellows, but, he said, that fellow over there knocked out two of my family last year. Two and two make four—if the wild goose knows his enemy why wouldn't he know his friend?

I have only ten acres, people; how can I protect the geese? There are eight boys around the neighborhood, from five families. I said to them: "If you won't shoot at the wild geese around here, I will see that you get a chance to shoot at one in the pond." That was in 1901. In 1905, 1906, and 1907 no wild geese came. In 1908, one morning eleven wild geese came, and they hadn't been there ten minutes before the boys came along with their guns. I said: "Boys, leave it entirely with me; don't shoot at them for a week or two." "But," they said, "you said we could shoot them?" I said: "Boys, if you don't get the opportunity to shoot a wild goose, I will give you ten dollars a piece, if you will let me manage it." They said: "We don't want your money"—of course they knew that I didn't have it. However, in about three weeks, we hoisted a signal, "Go on, boys." We were behind a bank I had thrown up there. Uncle Jack was to shoot the two ganders. The boys lined up on one side and cocked their guns, and as they raised them, I made it my business to scare the geese so that the boys wouldn't shoot them. Bang went their guns. The two ganders got away, but five geese lay dead in the water, one for each family. I asked the boys not to shoot the others. To my surprise and delight, the other six did not stay away two hours; they came back, and stayed until the time came for them to migrate. If you get one bird to come, there is your opportunity.

Next spring it was asked if the geese would come back. On March 18 I heard a strange honking and I looked up and saw that they were coming—32 of them. They came down within 100 feet of us, I walked out and they never flew away. I had the privilege of seeing them introduce their families. The boys shot 10, and that left 22 to go away. Next spring it was asked what time the geese would come back. They started to come on March 4 and in less than two weeks there were over 400 there. The boys shot 16 and let the rest go. Look how our flock of geese has multiplied; now we have a flock of over 350. They started coming

on February 20, and when the first was whirling down I counted 175 shots at him between my home and Lake Erie. When the first was lighting in the pond, you couldn't see the end of the string of families that were coming.

I don't know whether you have experienced it, but I have: there is nothing more embarrassing than to have more guests than you can feed. There I was, on Good Friday of 1913, with a five-acre field full of geese. We couldn't begin to feed them. Some of the geese must have told their friends what was not true, and induced them to come to a place where there was not enough to eat. We brought the feed close to the house and let the tamer ones come there to eat. I was speaking at the Rotary Club in London the other day, and one gentleman asked me how I moved the birds. This was my explanation to him: If you want to move your birds, keep moving the food accordingly, and pretty soon you can put the spoon in your mouth and the birds will alight on it.

I will tell you about one family, one of a dozen interesting cases last autumn. On October 10, six geese came. (By the way, we never had over 150 in the autumn. Which way do they come in the autumn?) I went out and called to these six geese, and the old gander answered. He knew me. I got twelve ears of corn, and threw one of them at him. Just as I did so the four baby geese jumped in the air, but he called them and they dropped down. Then I threw more ears of corn, and each time the same thing would happen; he would sound that low note, and every time he did so the geese would come down. By the time I had thrown the eighth ear he had convinced them that all was well, and they didn't fly up any more. It was interesting to watch him trying to educate them to take the kernels of corn off the ear, but it was strange to them. He would get a kernel off and drop it down, but it was fully fifteen minutes before he got those goslings to take the corn; when they did start they cleaned off every kernel of the twelve ears. That told me these young goslings had never seen an ear of corn before, and that they had come all the way from Hudson Bay without a mouthful and dropped down there. The old gander had led them all the way down.

My wife and I coaxed this old gander and his five goslings into the coop and she held the door while I went in and clamped a tag on his leg. After I tagged him I took him

to the door and threw him out—this same old gander that had been telling his girls and boys to eat the corn and to stay there and not be afraid. When I threw the gander out, did he fly to the lake? To know the Canada goose is to love him forever, and if there is any person in Ottawa who can tell me how that most intelligent, self-sacrificing bird came to be honoured by being called the Canada goose, I wish he would write me. You cannot show me any of his actions that one need be ashamed of, not one.

To resume my story. This old gander went out, and when he was about two rods away he turned around and looked back. You could hear him calling for the rest of his family in that little catch pen. Mrs. Miner at this time would rather have been on the inside looking out than on the outside looking in, because, as I was catching number two the gander came right back to the door and tried to break in and get at me. We are talking about the same bird that I tried to get a shot at three fields away; here he is now fighting to get at me to protect his young—trying to get his young out. He didn't leave that door until every one of his family had been liberated; he stood right there and fought for them. We caught him the second time, put a cuff on each leg and named him "Sir John Moore." We put on the tag this verse of scripture:

"No good thing will He withhold from them that walk uprightly."

They migrated as usual, and on March 17 following, the boys said, "Look, Dad," and there was old Sir John Moore looking for more corn, with the two cuffs on his legs. Five of his family had returned; he had taken care of them down in the southern states all winter, and brought them back. The last week in April they disappeared, and my heart sank when I opened a letter from Fort George, James Bay, and found four of the tags. The letter read: "The Indians say that seven geese came into their decoys, and they killed four of them; each one had a tag on it." You know just how I would feel, although that is part of the game. To the fellow who wants to shoot let me say this: I am not opposed to a man shooting a bird or two, but will you not join with us in limiting your gun? Remember, that bird that falls out of the air from your deadly aim gives you and me a little pleasure, but deprives thousands of people of pleasure and recreation in seeing it alive. Let us consider that; let us think it over.

Delilah raised during the six seasons—five families, two of eight and two of nine, and this year she came home with twelve. What does game protection mean? Protect the one duck, and you can quickly figure out what the total increase in six years will be. Delilah returned for the sixth time and she raised these five families. I haven't seen her since August.

The Canada goose is the most faithful and self-sacrificing bird on earth. I kept one for four years, and I know. I kept old Jack Johnson for two years and a half, but I got rid of him. I wouldn't keep a wild goose or a

gander around the premises after he had lost his sweetheart; they just keep on honking in that sad way. But the poorest-principled piece of live flesh in feathers is the drake; he is nothing but a Brigham Young, that's all. Puts me in mind of the mother who has to be father and mother both, like some poor washwoman who goes out and does \$5 worth of work and willingly accepts 50 cents for it; then takes it home to feed her family, while the lazy, good-for-nothing husband is putting in his time in the far end of nowhere, swapping garbage stories and passing remarks about the clean people that pass the dirty window. That is the principle of the drake.

Annual Meeting of Shooting Club

Tamarac Island Fishing and Shooting Club's Annual meeting was held at Hanover, Ont., on May 16th. There was a good attendance of members. The chief business was the election of officers, and the consideration of improvements to the property. Mr. G. McLaren was re-elected president, Mr. H. H. Stevens, Port Elgin, secretary-treasurer, while the directorate is composed of the two

officers and Messrs. Charles Koehner, Hanover; F. Moreloch, Hanover; E. R. Sayles, Port Elgin. The club's property is situated up in the Bruce peninsula, thirty miles above Wiarton, Ontario. The club own their Island. Last week the directorate met at the Island and planned for further conveniences for the members while at the Island, and enjoyed the excellent fishing.

U. E. Germain, Montreal, 1918 winner of the Rush Tango \$50.00 gold prize contest on muscallunge. Weight 42½ lbs., 52½ ins. long. Caught casting with a No. 5, yellow, red head, Regular Rush Tango Minnow.

The Rush Tango 1919 contest is now on and anyone securing a "big fellow" on the Rush Tango should secure a good photo and enter the contest.

Alpine Club of Canada

Victory Camp Will Be Held July 22nd to August 5th

The Rules and Regulations for the annual meeting of the members of the club have been issued in a ten page folder by the Secretary-Treasurer, Mr. S. H. Mitchell. This year's meet will be known as the "**VICTORY CAMP**" and arrangements will be concluded at it for the Grand Welcome Home Camp to be held in 1920, in honour of returned soldier members.

The Main Camp will be placed near the Summit of Yoho Pass, close by Yoho Lake, on the site where the first camp of the Club was held in 1906.

It is thought that after the four long years of war, general reconstruction will be in order, and that no more appropriate place can be chosen for a fresh beginning than at the site where the very first camp of the Club was held.

The Camp will be named "The Victory Camp" and, while many returned Soldier members will doubtless be present, such returned members will not be officially welcomed, the official welcome being reserved for the 1920 Camp at Mt. Assiniboine, when it is hoped to have all returned members present as guests of the Club.

The Camp will open on Tuesday, July 22nd, and close on Tuesday, August 5th.

Field Station on the C. P. R. will be the point of arrival by train. It is expected that special summer rates will be in force on the railways.

The Annual Meeting of the Club will be held during the Camp, for the presentation of reports and the transaction of business. It is also proposed to bring up for discussion the erection of a suitable memorial at the Club House as a record of the members of the Club who have been on active service during the war, and to formulate plans to establish a fund for the same.

The Yoho Valley well fills the expectations raised by its name. Yoho is an Indian exclamation meaning, Grand! Glorious! Wonderful! The valley comprises a maximum of mountain scenery in a minimum of area: Towering rock peaks, snow-clad massifs, leaping waterfalls, jewel-like lakes and silver streams winding through deep green forests. It is symbolized Fairyland, and every phase of it fills the beholder with wonder.

Maps of the Yoho Park, showing the area within which the Camp will operate, can be had at the Alpine Club House at Banff, or by addressing the Secretary of the Club.

S. H. MITCHELL, Secretary-Treasurer,
The Club House, Banff, Alberta

Photographic Competitions

A Photographic Competition will be held in connection with the Camp this year. This will be open to all amateur photographers who are members of The Alpine Club of Canada, whether attending Camp or not.

All photographs must be the unaided work of the competitor up to the moment of and including exposure. Development, printing, etc., may be done by a professional finisher if desired, unless otherwise stated.

Competitors may submit any number of prints and in any size desired, but each print must have the name and address of the competitor and the class in which it is to be entered clearly written on the back. Prints must be in the hands of the Secretary-Treasurer, S. H. Mitchell, The Alpine Club House, Banff, not later than July 22nd.

A trophy, to be known as the A.C.C. Photographic Cup, will be offered for competition in Class A. This will be held for one

year by the winner, but will become the property of any competitor winning it for three years in succession. Suitable prizes will be offered in the other classes.

All prints entered shall become the property of the Club.

Class A. For the best photograph to illustrate the title "**A Canadian Mountain.**" All pictures submitted in this class must be enlarged to a uniform size, approximately seven by eleven inches, but not mounted.

Class B. For the best landscape in the Canadian Rockies or Selkirks.

Class C. For the best set of six prints illustrating any one of the "War Camps" of the A.C.C.

Note.—The word "Amateur" shall be defined as follows: "Any person who does not earn his livelihood in whole or in part by the practice of photography shall be considered an amateur, even though from time to time

accepting remuneration for photographic work. Persons engaged in occupations to which photography is merely an accessory or means of making records shall not be regarded as other than amateurs."

All questions at issue shall be decided by the judges, whose decisions shall be final.

The judges will be selected at the Annual Camp. They shall be three in number.

Electric Starting and Lighting

NO car has a better starting and lighting system than that now available to purchasers of Ford Cars. It is a Ford product, built into the motor—

—a positive starter as reliable as the motor itself:

—a powerful lighting system, uniform under all engine speeds.

On the open models—Touring Cars and Runabouts—it is **OPTIONAL EQUIPMENT**.

On closed cars—Sedans and Coupes—it is **STANDARD EQUIPMENT**.

On all models the Ford Standard Magneto also provides ignition independent of the batteries.

See the Ford car with this new equipment.

Ford Runabout \$660; Touring \$690

On open models the Electric Starting and Lighting Equipment is \$100 extra.

Coupe \$975; Sedan \$1175 (closed model prices include Electric Starting and Lighting Equipment).

These prices are F. O. B. Ford, Ont. and do not include the War Tax.

ONTARIO

The Toronto Kennel Club Show

THE 16th annual show of the Toronto Kennel Club was held in the Horse Repository, Simcoe and Nelson Sts., Toronto, on April 18th and 19th and from the standpoint of fanciers and exhibitors was a success, in that there was a fairly good entry in the various breeds. Financially and as an attraction to the fashionable sporting class of Toronto it was not a success. Once again we must point out to the Toronto Kennel Club that until they can get the proper venue and put on a show which will appeal to the wealth and fashion of Toronto, will they lack a good gate. The Toronto Kennel Club will always have the breeders and exhibitors with them; make a try now for the other class of people and increase your gate and this will also mean more business for the breeder of good dogs.

The largest entries of this show were in such popular breeds as Terriers (Airedales, Fox, and Bull) English Bull dogs, Bostons and the various toy breeds. There were not many sporting or gun dogs shown but while low in numbers they were, some of them, high in quality.

Only four Beagles were shown, A. F. Godson showing two dogs and a bitch. His winning dog "Phillips' Vixen" (by Phillips Traveller and Suburban Girl) is a very good one indeed. H. I. Davis had one entry in Speedworthy Fleet (by Haig's Pleader and Lady Peerless) taking winners bitches.

Only two foxhounds were shown and they were that good pair—Vanguard and Nimrod Mars, both bred by Rodger D. Williams and owned by J. E. Keays of London. Mr. Keays is a persistent exhibitor and well he may be with such a good pair.

Montrose Shamus O'Brien (J. C. Hanna, Montreal, owner) was the best of the three Irish setters shown.

The only pair of Field Spaniels, Lord Bertie and Wardeworth Mollie were again shown.

The Pointer Ch. Perdreau was a lone one at this show; too bad to fetch this dog all the way from Montreal and then have no competition. Well the Montreal boys are sports anyhow.

Cocker Spaniels did better with an entry of sixteen, which filled the various classes moderately well. Mrs. Enright of Montreal sent up two and got winners in parti color dogs with "Centre Star." This dog took 2nd at the big New York show.

Chas. Bowerbank's well known Senator B., of Toronto, was winner colored dogs. This dog also did some winning at New York. The chief interest however in cockers, was Mrs. Moore of Vancouver, who was there in person with that good pair with which she won so well also at the big N. Y. show, Moore's Master Key and Moore's Moonshine. Master Key here accounted for winners, black dogs and Moonshine winners in bitches, black. In the sporting dog class she took 2nd to the Irish setter Montrose Thomas O'Brien. What is to the credit of above three exhibitors is that these dogs are of their own breeding and we are pleased to note that Canada is maintaining her lead in Cockers. Our friend Joe Hill, a veteran Cocker breeder was an exhibitor at this show, taking three seconds and reserve winners in black bitches with Belle Ewart.

In the other popular breeds above men-

tioned the winning dogs and bitches are respectively:—

Airedales—Claycliff Tenacity and Claycliff Swell Lady.

Bull Terriers—Master Boots and Belle Mahone.

Fox Terriers (smooth) Peerless Prince and Madison Atalanta.

Fox Terriers (wire) Mickey's Model and Clapton Vimy Ridge Attrition.

Boston Terriers—Hello Pardner (Buffalo) and Jackson's Dream Girl.

English Bull Dogs—King Moston and Cleverlock Molly.

Collies—Tipperary King and Quarrybrea Colleen.

Col. Bishop's V. C., Chow dog, Blue Goblin, was the most interesting exhibit at the show. This is a Chinese breed or dog of the Husky or wolf type. They are very similar to our Hudson Bay Husky except in that they are of

solid color, either red, black or blue (grey blue) and all have black tongues.

Another interesting exhibit was the black Belgian sheep dog Duceaux from Montreal. This breed of dog was used as a war dog.

Some of the notable visitors at the show were—Col. Bishop, V.C., Oakville; Jas. Bain, K.C.; J. G. Kent, Toronto; Mrs. H. Moore, Vancouver; Mr. and Mrs. Collins, Welland; Mr. Tuson of the Chinook Kennels, Lethbridge, Alta.; Thos. Millar of Winnipeg; Dr. Villeneuve, V. S.; Mr. Aitken and Bob, Ross of Montreal; Albert Mitchell (celebrated dog handler), Chicago; Chas. Webber, Miss Shortt, London; Lt.-Col. Pellatt and party.

"Dude" Baldwin of Ottawa was up and informed us that his good Fox hound "Promptu," good both in the hunt and on the show bench, had passed away. However this enthusiastic foxhound breeder has secured another good stud dog and also has some young stock coming along for next Fall's shows.

The Otter Hound

This dog is very similar in build to the Bloodhound but has shaggy coat similar in texture to the Airedales, only longer. They are very keen scented and have been used for hundreds of years in England for clearing the salmon streams of otters.

Some sixty years ago the small North of England rough black and tan terrier was crossed with the otter hound to improve its size and hunting ability in the streams; from this cross resulted eventually the Airedale terrier so named from the valley of the river Aire in Lancashire and Yorkshire where the breed was evolved.

Freeman Lloyd, the eminent canine authority, thus describes an otter hunt in his native country, Wales.

"The last day I went hunting was with Mr. Protheroe's hounds (they hunt Pembrokeshire and Carmarthenshire) and they met at the Salutation Hotel, Haverfordwest, where they had been kenneled overnight. They were actually tried first in the river not more than a couple of hundred yards away from this hostelry, and within five minutes the hounds were hunting a hot drag within the old Norman town and practically under the shadow of its inspiring castle. Away they went as hard as they could run—through the great, wild beds of yellow blossoming iris—on to the river bank, the hills

now re-echoing and re-sounding with those deep-tongued voices of otter hounds. What might those melodious tones be like? They can best be described as almost so full in body of note as the true bloodhound or of a still deeper volume than that of an old-fashioned American foxhound.

"The hunt is on and I will try and describe it: On and on they go. Then comes the welcome cry of 'Tally Ho!' The otter has been viewed and he is, of course, put down and the hunt now commences in earnest. It is very likely that he will make for his holt under the stump of an over-growing tree on the river. There is a hole above water, and may be two, or three, or more below. Hark; how the hounds bay him as they mark him in his supposed holdfasts. But the otter has reckoned not with the brace of terriers that are ready to do him battle within the supposed seclusion of his holt which may run from fifteen to twenty yards in its full length. So hounds are kept back while the terriers are put to the varmint. Here we ought to see the spunk and work of the real workaday Sealy Ham terrier. If the terriers are good enough, or by the aid of jumping or stamping on the bank above, the otter gets away and then begins a rattling hunt up and down stream, the *durgi* (Welsh) or water dog, keeping to the deep pools for choice. He

tries anotherholt and is bolted again and yet again. The water is now the color of mud because of the hunting, and hounds are speaking to his scent on the river ever and anon. Deeper and louder the voices become. The excitement born of hunting is now at its height. The otter leaps out among hounds and terriers like one with a charmed life. The savage scream-like cry of a hound proclaims that the otter has pinned him with those teeth that can with ease manage a thirty-pound salmon, in its own elements. Yet, perhaps, the little beast is only sixteen pounds, perhaps he's twenty-eight pounds. And on and on—up stream, down stream, and back into the pool they drive their otter again. Very likely, this has gone on for one or two hours.

"The *durgi* is getting winded. He will now try the land, so he seeks the shelter of some brush wood, briars, and the what-not of the river side; he thinks, perhaps, to make his way across to another brook—to a new and stronger holt he wots of. But alas, 'tis too late. As a leading, shaggy hound attempts

to seize him by the flank he turns to give a snap and a bite—a bite where the teeth meet. The hound is discomfited—but for only a single moment; for the body of the pack is upon him, and fighting and cutting; and succumbing only to numbers the otter yields up his ghost. Bid the loud horns proclaim the spoiler's fate—he dies; he dies. His, indeed, has been a brave ending. And Mr. Protheroe, a most estimable master it must be written, will tell you that even the long fangs of all his pack can scarcely perforate or lacerate that pelt. For the otter is the gamest and toughest of all animals that is hunted by hounds either on land or in water.

"The dog otter hound should stand about twenty-six inches at shoulder, the bitch about twenty-four inches. A nice weight for the dog hound is sixty-five pounds, and for a bitch fifty-five pounds."

There are very few otter hounds in America. It is doubtful if they could be used successfully on otter here owing to the intricate lake and stream system and also to the protection of game laws.

Campbell Dog Team Wins Again

In the 1919 dog race that finished at The Pas, Manitoba, Bates Campbell, "mushing" behind his dog team, crossen the finish line first in the annual 100 mile Hudson Bay Dog Derby at twenty minutes after one p.m. Campbell, made the course without stopping in fifteen hours and thirty-five minutes. McKay a favorite, was second. Five out of seven entries went the hundred miles without rest and finished. The test was one of endurance as well as speed, as the

trail was banked high, with new snow in spots, and badly cut up in other places. Campbell's huskies, coming from behind on the home stretch, nosed out the strong McKay team by the length of two dogs. Hayes, third to finish, was less than twenty feet behind McKay. Campbell drove the same dog team that his brother, Albert Campbell, piloted to victory in the Winnipeg-St. Paul race last year. A big crowd saw the sensational finish.

The Airedale as a Hunter

Although the sporting possibilities of terriers have usually been limited in popular opinion to rat killing, within recent years many sportsmen in all parts of the country have come to realize that the Airedale, by virtue of his unusual physical qualifications of size, strength and coat, his remarkably keen nose and wonderful intelligence, possesses a sphere of all around usefulness to the sportsman that is not approached by any other breed of dogs. The disposition of a young Airedale terrier, like a healthy growing boy, is all energy, dash and go. He doesn't want

to keep still and it is impossible for him to do so; he has got to be doing something. With it all, he is full of life and pluck. When taken out for a ramble he goes trotting about here and there looking for something to worry, now working his way laboriously through a brush-pile or under a hedge, now peering expectantly into some burrow which he enlarges with a few vigorous strokes of his sturdy paws. It is this healthy independence of character and aggressiveness of spirit, properly developed and controlled, that makes

NORTHERN ONTARIO

This vast new land of promise is one degree South of Winnipeg, and is big enough to include the six New England and four Middle States of the American Union.

Aside from its immense resources in timber, mineral, waterpower, fish, game and scenery, NORTHERN ONTARIO contains millions of acres of fertile, arable land fit for mixed farming which may be had by returned soldiers and sailors in 160 acre blocks free; to others, 18 years and over, 50 cents per acre.

Already there are thousands of miles of colonization roads and steam railways spreading like a spider's web over a huge part of that immense forest-robbed territory.

SANITO SUSPENSORY

No. 50

All elastic. Self adjusting. Anatomic fit. Will not chafe. No buckles. The pouch is open at rear, and thereby more sanitary.

Perfectly comfortable; need not remove from scrotum when seated at closet, and can be boiled to cleanse without injury to the rubber.

The Sanito No. 50 should be worn constantly to promote health and vigor.

If your dealer will not furnish, send us \$1 in stamps, specifying large, medium or small pouch and waist measurement. Satisfaction guaranteed or money refunded.

The Walter F. Ware Co. Dept. C. Phila., Pa.
Makers of the No. 44 Mispah Jock

the finished Airedale the most useful of all-around hunting dogs.

Airedales take as readily to hunting rabbits as they do to killing rats, and will work brush piles and hedges most industriously. They will jump rabbits that may be shot in front of them or whose trail may be taken up by beagles and hounds. Although Airedales have good noses, they are not as keen as a hound and cannot distinguish between fresh and old tracks and are apt to spend a good

deal of time pottering on old trails or working on a back trail. They can be broken of this fault, or rather, they can be kept from getting into the habit, by taking them out early in the season and getting them to work on young rabbits that are in the meadows and orchards or along the thickets, before the latter have acquired much cunning or taken to holing. At this time rabbits are easily caught and the puppy, as soon as he has run one down, will start hustling about to jump another.

"Two Birds With the One Stone"

To kill a deer at 130 paces with one bullet, is considered fair shooting but when one shot fired from a .303 drops two animals, at that

distance, even the professional Nimrods sit up and take notice. Mr. F. J. Campbell of the Canada Paper Company, Windsor Mills, Quebec, sent in an account of the unique

killing of a buck and a doe with the bullet reproduced. "Mr. N. Rouillard, the foreman of St. George Camp, was going through the bush in December, when he sighted the head of a buck, which was standing still at a distance of 130 paces, as ascertained later. He fired a .303 Savage and the buck dropped. Imagine his surprise when he found two deer instead of one. The bullet had passed through the head of the buck just over the eyes and then hit the doe, which had been standing unseen, breaking her back. The two were lying about ten feet apart, the buck dead but the doe was still struggling."

The country contiguous to Mount Robson and Jasper Parks in the Canadian Rockies is well stocked with big game, being the mecca of hunters from all parts of the continent. Three caribou are seen in this picture, having been snapped after they had followed the camera outfit for nearly a mile.

SAVAGE

Charles Cottar's Faith in the .250-3000 Savage

YOU know what the gorilla is—the huge, silent uncanny man-monkey who glides through the dark, tangled African jungle as swiftly and easily as a shadow. You know that gun barrels have been bent by his black, hairy wire-sinewed fingers—have been crushed by his ghastly protruding fangs. You know his supernatural vitality, his fiendish intelli-

gence and his horrible vindictiveness when attacked. Even the lion fears him. He's the most unnerving problem a hunter can face.

Why was it that when Charles Cottar, the experienced American big-game hunter, tracked the gorilla through the dense, tropical East African bush, the rifle he deliberately selected from his arsenal for this nerve-straining, hair-raising, desperate work, was his .250-3000 Savage?

Think it over. And remember that this same 6-shot repeater weighs only 7 pounds—that it has a point-blank range of over 300 yards—that it is accurate enough to make "possibles" at 800 yards and that it hardly kicks at all.

See it at your dealers; get the "feel" of it in your own hands or write us for particulars.

Letter from an American Reader

Editor, Rod and Gun:

It is surely a treat to read many of the really fine articles and stories that appear in *Rod and Gun* in Canada, they bring so vividly to the reader the personalities of their authors who surely are ardent lovers of God's great big beautiful world and the clean free out-of-doors, and one can get from them a very fair view of Canada with its wild enchanting woods and streams and mountains. Some sad things appear occasionally, references to the boys who went "over there," to help make a better world—a cleaner place to live in. To the fathers and mothers we would like to say a word of comfort but we can hardly do more than let them know that they have our heartfelt sympathy. After all life is very short and uncertain at best and the better part of life consists of deeds, not words.

At the beginning of the war when the Canadians got their first whiffs of the Huns' damnable gas I can easily imagine what they thought, they, who being sportsmen, had the inherent instinct to play fair. I can imagine their disgust, and how this was soon replaced by righteous wrath and how they got back at them has been told and will be re-told for all time.

I have noticed that in a recent issue another has misunderstood or at any rate gives the impression that he does, what Mr. A. A. Haines said about shooting a revolver from rest—and with both hands. I must confess, with regret, that I made a similar mistake once, but "never again."

Not for all the revolvers on earth would I say anything to hurt Mr. Haines' feelings. He has done more to enlighten some of us on practical shooting and the proper use of guns than any other writer I know of. He takes pains to experiment and tells what he knows to be—not what some one else says—and very seldom tells us who know nothing

about it the very nice refinements of scientific—gunning, shall we call it? I believe him to be a very good rifle and revolver shot, one who can easily and consistently make a tin can rattle at reasonable distances without any recourse to rest—or two hands with a revolver.

Many questions are asked through *Rod and Gun* and it is very pleasant to read how nicely and clearly the questions are answered. Any questions asked, or any experiences given, are very interesting, provided, of course, the questions are honestly asked and the experiences truthfully told. Bits of instruction often come from unexpected sources and useful knowledge is always to be prized no matter whether exquisitely or more or less crudely served. When a person is really thirsty a drink of cold nice water tastes as well from a tin dipper as from a gold goblet.

Advice is often solicited as to what guns are best. I wish I could give the proper advice but do not pretend to be an authority. I have, however, found Colt's .22 Automatic to be a very accurate pistol and the ammunition is cheap. The Winchester .22 octagon barrel suits me perfectly—.22 short only. Colt's Army Special .38 using full 33 special cartridges is entirely dependable—a 45 S. A. or New Service is O.K. if you want more punch, and every make of modern high power rifle is good—make your own choice. Yours truly got a Krag carbine from Uncle Sam for \$3.06 which is all the high power gun I wish for.

I love the outdoors—delight to go into the wild places and see the wild things—do not shoot them, except the vicious kind, and not always then—circumstances govern. A peculiar elation takes possession of me if I am caught in a wild driving storm in the mountains, remote from human habitation, and I am not alone in this. Who is it that said:

Irish Rifle Association

A Reply to Bisley Marksman's Criticism

The unwarranted criticism of the Irish Rifle Association appearing in the June issue of the "*Rod and Gun*" is an outburst which scarcely deserves notice. Absurd as the article is, with its contortion of facts, and contradictory statements, we do not propose to allow the sophistical utterances of a "Has Been" Bisley Marksman to influence such readers who are not acquainted with the true history and activities of the Irish Rifle Association. The tirade palpably emanates from a small clique of riflemen, headed by an ex-Bisley marksman, who evidently has a personal grievance to air against our Association, and we wish to express our surprise that you should permit the use of your bright little magazine as a medium for publication of such trash, which is representative of the opinion of a disgruntled minority only.

And why does not B. M. sign his name? Does he lack the courage of his convictions, or does he wish to preserve his ignoble incognito for the approaching O. R. A. meet, where he will meet and come in contact with many of the Irish Association against whom he raves? But, unfortunately for Mr. Afraid-to-sign-his-name, we are well acquainted with his identity.

His sneer at Mr. Smith as an "amateur" is amusing, and we are prepared to back our amusement substantially that this "amateur" could beat Mr. B. M. at any range or ranges available at Long Branch. Mr. Smith joined the Association two years ago, a green marksman, and his remarkable improvement and present ability as a shot are too well-known to mention here. But the point is this, that Mr. Smith and many others were trained entirely by the Irish Rifle Association, yet B. M. wants to know what we have done to promote rifle shooting. A few lines further on, he admits that we carried on practice throughout the war, and we suppose still wants to know what we have done.

This practice during the war produced such marksmen as Mr. Smith and many others who are not to be sneered at because they have not had the opportunity of shooting at the D.R.A., O.R.A., and Bisley. In fact, the Irish Rifle Association can put a team of tyros in the field that would make any team of ex-Bisley marksmen, picked and captained by our criticizer, sit up and take notice. And, by the way, what has Mr. "Has Been"

Bisley Marksman done himself by way of promoting rifle shooting during the past five years? Possibly "knocking" the Irish Rifle Association is his idea of doing this. And why does he not do his "knocking" in the open?

That many of our members are identified with the militia, and may line up with their respective regiments at the O.R.A. meet, is quite true, but why should not the I.R.A. take credit for their good scores when shooting for and with the I.R.A., and using the privileges which accompany membership? And the very fact that these militiamen were practically dependent on the I. R. A. for regular practice is another argument as to what we have done to promote rifle shooting. And we venture the statement that many of the best individual scores made at the O. R. A. meet, for whatever unit they are made, will be directly traceable to practice afforded to them by this Association. As to the actual team that this Association will be able to put in the field after withdrawal of members for their regiments, its strength may surprise our criticizing friend.

As for the so-called "Board of Trade" team which defeated the Irish team in 1915 B. M. omitted to mention the fact that the Irish team used Mark VI. "round-nose" ammunition whilst the "Board of Trade" team used Mark VII "pointed." The idea was that the latter team, being a junior team, should be allowed this handicap which could conservatively be estimated as worth three points per man. And when this "junior" team appeared, it was found that they were the pick of two battalions of one of the militia regiments! This "ordinary" team "with scarcely any practice," (having practised all their adult lives in some cases) certainly accomplished a wonderful achievement in defeating the Irish team.

The insertion of Sharpe's targets was a private enterprise, and we would advise B. M. to take that matter up with Mr. Sharpe himself, but if, as he says, he does not for a moment believe that such targets were made, why does he end up with the contradictory statement that he has personally seen just as good a performance many times before?

The innuendo that some applications for membership are refused without good reason, is without foundation, and he may consider

our emblem applicable to himself only, as far as membership goes; all we insist on is that the applicant be of British birth and good character, and that he will make the interests of the Association his first consideration.

If Mr. Old Timer had taken the trouble to acquaint himself with Bisley conditions and program of 1919 before venting his "grouch," he would not sneer at the 200, 500 and 600 yard ranges. The blatant utterances of Mr. Old Timer will not affect the future of the Irish Rifle Association, and we are glad of this opportunity to rip his idiotic criticism up the back, and expose him for what he is, a writer of anonymous slander, discreditable to the fine class of riflemen whose name

he uses to hide his real identity. And in conclusion, we once more ask—why does Mr. Bisley Marksman protect himself with a nom-de-plume? Safety first can it be? We wonder.

(Signed) D. Spence,
13 O'Hara Ave.

President.

St. Thomas International a Huge Success. Good Scores and Hot Weather Characterize Tournament

"Pull . . . Bang . . . Hit" And Frank S. Wright of Buffalo only did that 437 times out of a possible 440, at sixteen yards at the Grand International Trapshooting Tournament held in Pinafore Park, St. Thomas on June 2, 3 and 4. The Tournament, which had the honor of being the first of importance to be conducted in a city park, was held under favorable shooting conditions although the heat was oppressive. As someone remarked, "It's only 95° in the shade, but then you can't have to stay in the shade."

A Good Attendance.

All of the boys were there from "Wes" Hart, of Dresden, the daddy of them all, to Wilfrid Peters of Turnerville, the boy prodigy shot. Sim Glover of Rochester, and Frank Wright of Buffalo, were representative of the United States shooters that were given a royal welcome when they put in an appearance on the first day of the shoot. The Toronto "reliables" were on the job and prominent among their number were Geo. M. Dunk, and H. W. Cooley. Mrs. W. D. O'Loane of St. Thomas, shot next to her husband in Squad No. 2, and had the honor of being the only lady shooter present and made a very creditable showing throughout the Tournament. The St. Thomas Chapter of the Daughters of the Empire lived up to their enviable reputation for public service and supplied lunch, refreshments and iced drinks to the "gunmen" and spectators.

McCance a Live Wire.

The main honor of making this tournament one of the most successful this year can be given to the live wire secretary of the St. Thomas Gun Club, "Billie" McCance, who was assisted by William O'Loane and other members of their Gun Club.

Thompson Takes Handicap.

Although Frank Wright was high gun on Monday, Tuesday and Wednesday morning he was defeated at the 22 yards stake in the handicap by A. A. Thompson of Windsor who took high money by "killing" 95 clay birds at 17 yards.

Modest Frank Wright.

All modest men are not good trapshooters but the majority of trapshooters are modest men. Particularly true is this in the case of Frank Wright of Buffalo, who broke 100 targets on the morning of the last day

of the shoot. When asked how he was getting along he shrugged his shoulders in a helpless manner and said, "I seem to be breaking them all right but I don't know just how."

Good Shots.

Jim Vance of Tillsonburg, Billy Marshall of Galt, Sim Glover of Rochester, Wes. Hart of Dresden, Nelson Long of Hamilton, Kennicott of Evanston, Ill. and H. W. Cooley of Toronto were the top notchers for the three days' shooting. Wilfrid Peters of Turnerville, the phenomenal 17 year old shooter is rapidly coming to the front and under the careful tuition of the veteran Wes Hart should rank with the best before next season. It is encouraging to see new blood of such high calibre coming into the sport alluring. H. D. Bates of Ridgetown was one of the old timers who made his initial bow this season at the great International.

New Class System.

The new classification of shooters according to the 1918 records was adopted for the first time. It proved a decided success with all the shooters. With this new system in vogue a tyro at the game has a chance to compete for the monies, which previously were all taken up by the experienced shots. Many "c" class men received generous prizes yesterday, who in other years went unrecognized. The new system in certainly an encouragement to the beginners and it also adds zest to the game for the crack shots who have fewer to compete with and thus less chances of winning prizes.

A Journey of Joy and Contentment

COME where the mighty rivers of Canada flow onward to the Sea—take a boat trip on those rivers, let your eye drink in the delights of a scenic panorama that has no equal in America—let your mind become refreshed with a change of scene so complete that all cares will be forgotten in the engrossment of a journey that brings new interest with every mile—new wonderments with every hour. Well named

“NIAGARA to the SEA”

this trip begins with the beautiful Niagara River; traversing Lake Ontario and some 250 miles of the mighty St. Lawrence. It takes you through the 1000-Islands Scenery—it gladdens the eye with glimpses of green-clad river banks—it thrills you with the novel experience of shooting mile after mile of Rapids. It gives you stop-over privileges at such point, of interest as Toronto, Montreal and Quebec—also at Murray Bay and Tadousac where splendid Summer Hotels are operated under Canada Steamship Lines management.

The climax of this 1000-mile journey is reached when the boat steams slowly up the magnificent canyon of the River Saguenay—where the traveller's amazement is tinged with awe as he beholds Caves towering higher than the Rock of Gibraltar.

This glorious outing affords you an opportunity of seeing the most picturesque part of Canada, from the deck of a palatial steamer. You will return from such a trip refreshed and invigorated—satisfied, too, that you have had the finest boat trip holiday it would be possible to conceive.

ARE YOU TRAVELLING WEST ?

Break the long journey; travel by boat from Sarnia to the “Soo,” Port Arthur or Duluth. Write for particulars of Upper Lake Cruises through the Great Unsalted Seas.

FRONTIER GUN CLUB SHOOT.

Sarnia.—On Wednesday afternoon, May 14th, the members of the Frontier Gun Club held their opening "shoot" on their splendid grounds, North Christina St., under ideal weather conditions. A large attendance of members was present including some "Old Timers" from Port Huron, amongst the latter were Messrs. C. Roche, H. Cockburn and H. Mains.

Mayor W. Nesbit, Warden I. Huey, Reeve P. Gardiner, Ald. L. McAdams and Ald. H. Sanders were the first quintette on the firing line, and acquitted them-

selves creditably. The Mayor congratulated the Club on its fine grounds and large membership and wished it every success. The next squad to face the traps consisted of our Port Huron visitors and local experts. These guns by their fine shooting, poise and speed clearly showed the element of chance does not exist and skill and experience score every time. The novices showed great enthusiasm and were eager to get all the practise they could. Henceforth the bi-weekly "shoots" will be held on Wednesdays and Saturdays at 3 o'clock.

Sarnia, May 24.—The Frontier Gun Club shoot held on their grounds to-day was a great success.

Miss Zella Smith, a little eleven year old lass, with a 20 gauge gun, without handicap, took second prize in the ladies' event, and had she taken a handicap undoubtedly she would have made off with the first prize. Following are the prizes and the winners.

Class A.—First prize, cut glass berry bowl won by D. Tuck; second prize, cut glass dish, won by H. A. Smith; third prize, a pair of shooting gloves on a tie with R. Doxtator; fourth prize, a pair of gold cuff links, G. T. Eastman.

Class B.—First prize cut glass berry bowl, won by T. G. Gates; second prize, cut glass dish won by H. Smith; third prize, pair of shooting gloves, won by N. George; 4th prize, gold cuff links, won by A. George.

Class C.—First prize, cut glass berry bowl, won by C. Killer; 2nd prize cut glass dish, won by G. Palmer; 3rd prize, pair of shooting gloves won by J. Hutchison on a tie with S. Crosbie; fourth prize, pair of gold cuff links won by H. Sanders.

Ladies' Class.—First prize, special, a cut glass berry bowl, donated by the president, H. Sanders, and won by Miss Maud Smith; second prize, a cut glass bon bon dish, won by Miss Zella Smith; 3rd prize a cut glass dish won by Mrs. H. A. Smith.

The special prize, a box of cigars donated by the vice-president, W. Tuck for high gun, was won by T. G. Gates.

P.S.—J. W. Smith won third prize in class A. on a tie with R. Doxtator.

HAMILTON GUN CLUB.

The continued fine weather brought out a good attendance of shooters at the Hamilton Gun Club on Saturday afternoon and in all three classes some extra good scores were put on.

For the merchandise prize in class A. J. Hunter and Bert Smith tied with 25 straight and in the next time out B. Smith won out with 24, while J. Hunter broke 21. J. Gomph and R. H. Kretchman were right behind with 24 and the old rivals, G. Beattie and W. Barnes were next in 23.

In class B. T. Gardiner won very handily, having also put on a 25 straight for this event. C. Graham and H. Smith were tie for second place with 22 and Dr. Greene and G. Stroud were next with 20 each.

W. H. Pratt showed great improvement in class C and won with a score of 21. N. Long finished second with 18 and A. Glover was right behind with 17.

The scores in the above event counted as the second event of the Dupont series and as a result, W. Barnes, J. Hunter, H. Lennox, N. Long and R. H. Kretchman are tied for the lead with 45 in class A. T. Gardiner is leading B class with 44, while A. Glover holds the edge in class C with 36.

Bert Smith put on the good score of 72 out of 75 and had the high average for the afternoon. T. Gardiner and M. E. Fletcher were next with 46 out of 50.

C. Graham succeeded in taking the challenge medal from M. E. Goodale with a score of 20 against 19. At the next shoot the medal will be put up in open contest, giving all the members an even chance to win.

During the afternoon a few events of doubles were put on, Nelson Long being high with 53 out of 36 pairs. J. Gomph and R. H. Kretchman got 32 and 31 respectively out of 24 pairs.

The scores were:

WANTED—Second-hand shooting boat, Mullins or Green Bay preferred, also canoe 12 or 13 foot, any make, must be in good serviceable condition. Reply Box 110 Rod and Gun, Woodstock, Ont. 6-2T

BOAT FOR SALE OR EXCHANGE—Motor Boat, 25 ft., Ford Engine, reverse gear, Maxim steering, speed about 12 miles, Atwater Kent ignition, cost over a thousand to build; will exchange for a Car or accept reasonable offer. You should see this boat to appreciate it. Apply Box 350, Rod and Gun, Woodstock, Ont. 7-1T

DOGS

FOR SALE—American Fox Hound, bitch, \$20; and three pups, two months old, \$15 each. Alex. Green, 200 Dundas St., Woodstock, Ont. 7-1T

Our Specialty is breeding spaniels for duck and partridge hunting. Dog pups ten dollars each. Highbury Kennels, Port Hope, Ont. 7-1T

FOR SALE—One pedigreed English bull bitch. Five months old. H. B. Vansickle, Box 331, Paris, Ont. 7-1T

FOR SALE—Eight fine American fox hound pups, fox, coon, deer and rabbit hunting strain, bred from stock of great record. For particular Ed. Rothaupt, Elmwood Ont. 7-1T

FOR SALE CHEAP—Deer hound trained, also on rabbits, and to ride in canoe or buggy. For particulars write, Arthur Skinner, 26 Front St., Orillia, Ont. Box 583 7-1T

WANTED—Water spaniel retriever for marsh work. Jno. Millman, Thedford, Ont. 7-1T

Two black and tan beagle bitches, trained. Four beagle pups, 5 months old, genuine hunting quality, selling out cheap. James Stock, Mimico, Ont

FOR SALE.—Splendid Llewellyn, English, Irish, Gordon setter pups and trained dogs, pointers, spaniels and retrievers in pups and trained dogs. Enclose stamp for description. Thoroughbred Kennels, Atlantic, Iowa. 1F

THE BLUE GRASS FARM KENNELS, OF BERRY, KY., offer for sale, Setters and Pointers, Fox and Cat Hounds, Wolf and Deer Hounds, Coon and Opposum Hounds, Varmint and Rabbit Hounds, Bear and Lion Hounds, also Airedale terriers. All dogs shipped on trial, purchaser to judge the quality, satisfaction guaranteed or money refunded. Sixty-eight page highly illustrated, instructive, and interesting catalogue for ten cents in stamps or coin. 5-TF

FOR SALE—Airedale pups, registered, very choice. C. A. York, Ruscomb, Ont. 6-TF

THE HOMESTEAD KENNELS, GREENWOOD, MISS.—Have for Sale Trained Hounds, for Fox, and Cat, Wolf and Deer, Coon and Opposum and Skunk, Squirrels and Rabbits, good as live. Fine lot of young dogs. Trained dogs sent on 15 days trial. 10 cents for illustrated catalog. 5-TF

AMERICAN FOXHOUNDS—A few March pups still unsold; now booking orders for June and July litters, all eligible to register. J.E. Keays, London, Ont. 7-1T

"FIELD AND SHOW DOG"

With All Breed Directory Combined. Special Department on all breeds, especially Airedale terriers each month. The best and most popular Kennel advertising medium in America.

Issued monthly. Price \$1.00 year, sample copy 15c.

No. 3

BONNYCASTLE DALE

WHY does the tide run so swiftly?" Laddie asked as we struggled with our paddles northward along the Gulf of Georgia.

"Did you ever hear the old song 'The Meeting of The Waters,' it might have been written about this place—the tides meet here." A truly wonderful sight. It was lowest low tide and the great masses of water that twice daily sweep about Vancouver Island were piling their foaming edges against one another just south of Seymour Narrows—the most

treacherous passage on the Northern Pacific Coast of Canada. Our long Sooke log canoe bounded and jockeyed over the lean hungry waves like a boy's rocking horse——

"It's getting pretty bad." I called to O'poots, our West Coast Indian guide.

"Hyas Skookum Chuck," (means "Great Big Waves," or "Great Big Water" rather, in the Coast Jargon called Chinook, a mixture of French, Spanish, Indian and English.)

"Laddie" and I just pat-patted

with our paddles to keep her head on while the native in the stern flung his narrow sharp pointed blade from side to side, his dark eyes flashing as brightly as his wet blade. Within ten minutes we were lifting and falling over the regular swell again, behind us the "rip" made by the meeting of the tides looked like some immense rapid in mid-ocean, a long streak of white angry tossing seas.

"Sammon!" said O'poots, as a big silvery thing broke water near us, so out went the lines. Laddie used a handline of stout twisted linen. I used my big lance-wood salmon rod with 200 yards of heavy Irish linen line and a copper and silver S shaped spoon. The hook, with a shank of five inches in length; was baited by the Indian with a small Oulican, or Candle Fish, a fish so fatty that when dried the natives burn them like torches or candles.

We were yet about three miles from shore. Above us roared the struggling waters of Seymour pass, roaring like a bull. Four miles behind us we could see the broken top of The Mittenatch, the most northerly island in the Gulf. To the west lay the green wooded shores and shore hills and mountain ranges of Vancouver Island, and in the centre of the shore scene entered the far famed Campbell River, the best place for salmon and trout on all this Pacific Coast—for the simple reason that here gather an infinitude of schools of small food fishes to breed so, from time immemorial—whatever that means—the fishermen of the world have foregathered here to try for record fish.

It was early in the year and the great Spring, or Tyce, or King Salmon, or Chinook or Quinnot as the natives call them was "running." He is the Columbia salmon on the Columbia, the Sacramento salmon on the Sacramento, in the Russian settlement "tschawyttscha," but generally by the white man he is called "Spring" and by the Indians "Tyce" (big) and big he truly is. We have seen or taken him all along this Pacific coast from California to Alaska, wherever the herring or the

smelt or the Oulican run there the Spring salmon is to be found.

We had been fishing for them in the early spring months in the Straits of Juan de Fuca, one very odd thing we noted, some of the salmon we caught, our largest was 43 pounds, were all red fleshed, this red of the flesh of the salmon is caused by the innumerable, tiny, free swimming shell fish they eat, as well as the fish they consume that in their turn live on the tiny shell fish. Some that we caught were half red and half white and some were striped and patched red and white like a barber's pole. All these great magnificent fish were then coming in from their deep sea feeding grounds—alas! unknown to Man (—and a jolly good thing for the fish too). It disappears for some two or three years from our sight altogether, but it must return at about four years of age to spawn and die. I have never yet seen one of these fish that weighed a full 100 pounds, the upper reaches of the Yukon have a story of one that weighed 140 pounds, great numbers have been taken of 70, 80, and 90 pounds weight. I have seen a thousand dead Spring Salmon that averaged over 30 pounds weight. We know that this valuable food fish goes northward around Point Barrow. It is remarkable how many of these huge salmon will use one small bay, over a quarter of a million pounds of this fish caught trolling by the Indians have been shipped from Ketchikan alone in one season. It certainly was a snap buying white-meated salmon—no matter what the weight, for twenty-five cents and red-meated ones for fifty cents, but these Alaskan Indians did not know better THEN—now they know that we get fifty cents a pound for this fish laid down early in London markets.

"I've got him! I've got him!" yelled "Laddie" at this moment as he sprung up erect in the bow, and started to pull in hand over hand—at this critical moment the Spring learned for the first time that the shining smelt he had captured had in reality captured him and he leaped up in a sparkling fountain of water, a

Campbell River Falls*

great shining mass of silver, about a thirty-five pound fish.

"Don't you touch that line O'poots!" cried the lad as he was tumbled and dragged backwards past me right into the Indian's arms. "I'll land him or lose him myself!" he sputtered out. The lad's fat arms were extended straight at the fish as

if imploring him not to pull quite so hard—the salmon now started to see-saw back and forth across our stern, at times leaping in shot, splashing plunges across the surface—at times he had the Indian and the boy well out over the stern—but never a hand did the Indian put on the straining line—the tide was with

the fish and we were going backwards rapidly. Twice I saw other salmon break near our struggling fish and I knew we were right in the midst of a feeding school. Sometimes "Laddie" had five or ten yards nicely gathered in when off would run the big broad silvery thing and out would go the line. By this time I had managed to get my line completely in, even though once the fish had leaped over it, so I lighted my pipe and watched the boy. He manhandled that fish shockingly at last—

"You won't come in!" he yelled—mad all over, as he had just dipped both arms to the elbows in a passing surge of a whitecap—he braced both feet and pulled hand over hand, the line falling in great coils on O'poot's knees and arms, water and boy splashing and falling everywhere. "NOW! — THE — KILLING-STICK—" spluttered the lad. I saw the brown arm hand up the short gaffhook-ended club, there was a mighty boiling of water at the stern of the canoe, a fat hand armed with a dark club arose in the air and fell with a mighty "thwack" on the fish and glanced off—and but for O'poots swiftly grasping the loose cloth in a certain part of "Laddie's" costume the young gentlemen would have gone in swimming with the fish, but between them they dragged it into the boat. "Laddie" unseated the gaff and three blows on the shapely head and a consequent swift beating of the tail by the fish told that the fight was over and the poor thing out of pain and misery—for did you ever note what wild alarm seizes this beautiful thing when once it finds itself, for the first time, a captive, that tiny heart, far up the throat, beats in frantic fear, every nerve is strained and the agile creature will do then what, it has carefully avoided doing all its life—beat its body against another object—for fish value the slime that encompasses them and are very careful about displacing any of it. There lay thirty odd pounds of most excellent food. It was a female and already the egg sacs were becoming filled. She was on her way to her birthplace, tempted by the mass of

food she forgot her primal object—to spawn—and again filled her stomach with food.

As this was early spring she was not really confirmed in the habit of starving herself but later, once they have reached brackish or fresh water, once some inborn monitor speaks, they each and all stop feeding and for days and weeks and months, while they travel from the Straits or estuaries to the headwaters of some distant river they go 2000 miles up the Yukon—on, on they go, up riffles, over rapids, up falls, leaping as much as twelve feet upwards—did you ever see a salmon take this wonderful climbing rush, they go at it in sections you might say, leaping up a few feet right into the widest, thickest flow of the fall, then by swift zig-zag motions, the very intensity of swimming, a seeming wriggling of the whole body, they pass swiftly over the brow of the fall. You would really think they would stop when they come to dry pebbles—I tell you that "Laddie" and I have both of us put our feet in the way of an upward struggling salmon and have had them, time after time, wriggle over our feet and plunge and splash their way into the next pool above.

But by now we are nearing Campbell River and in the estuary is a very good place to take a fish, and no matter how many salmon one gets you can always give them away, so I pass my rod over to the boy, according to promise, as I must teach him the little I know of the art. The incoming tide was eddying and creaming over the shallows and driving our thirty foot cedar log canoe with it in fine shape when up jumped the lad again—not a word out of him this time, he was watching that delicate tip for a strike. Suddenly I saw his eyes flash and his lips snap tightly together, then he struck like a Briton to make good his hold, his thumb slipped and the reel sang the wildest song I have ever listened to, a regular screech—fifty yards went in an instant—twenty-five more. "Best snub a bit lad," I cautioned, as three-quarters of the entire line was out and a fearsome job it would have been for

Campbell River, B. C.

me to garner it in this boiling rush, but he went at it as if he was turning a hand organ and he laid it on to that reel in regular coiling wet sections—as fish and tide and canoe were all being swept the same way now, suddenly we struck bottom and remained fast—and there was the fish calmly swimming around in another pool, entirely separated from the one we were grounded in, soon we were swept off and fish and tide and canoe tumbled on, the lad reeling in swiftly whenever he got a chance. As it was all riffles and shallows ahead we threw out the anchor and fought the last fight in the last deep pool. Like a hero the lad stuck to it, my heart was in my mouth sometimes at the most wonderful curves and bends he put in to that devoted rod, but he always gave it the butt when necessary and gained every inch he could, finally he had it where we could see it, as this one never jumped once, the swift swirling waters keeping it down. It was a smaller fish than the last by a few pounds, but nearly a thirty

pounder for all that. I smoked several pipes before that ever circling fish was drawn by the boy near enough to be killed by the Indian—one swift blow, one rapid gaffing, one long pull and in flopped the mate of our first fish—a male this one with milt bags just filling, a clean shapely silver Spring.

During the days that we camped about the mouth of this glorious river, and later in the summer on our way south, we walked up to the falls and admired their wild beauty and caught many strings of excellent eating cut-throat trout in the cool clear water. We had a laughable adventure one day, a tiny Indian lad who had been a frequent visitor to our camp was fishing in one of the pools left by the falling waters, this was in early spring and the flood was past and the river was a string of rippling rapids and small pools, in one of the latter was an imprisoned Steelhead, the so-called “trout” out here, really a perfect western form of our own Atlantic Salmon *salmo salar*. The little,

brown faced, bright eyed lad threw into the pool the tiny silver gilt minnow I had given him and swiftly drew it towards him—out from under the bank he was standing on darted a huge pool-imprisoned Steelhead, as black as your hat from river stain, he grabbed that Tacoma bait and took it and line and pole and little Indian boy clear across that pool, the kiddie had not been expecting any such whales as that in a two foot deep pool. I heard the splash and looked up from my notebook, the youngster was mortally offended. He seized the

willow pole he had been using and chased that big black trout all over that shallow pool, prodding and whacking and pounding at it—silent as the fish itself all this time. “Splash”—“Whack” went the pole, “splash,” “splash” went the fish. Around the pool the varying tide of battle carried them until the fish made one false move and entered a shallow, in an instant that kid was upon him, seized him in his arms and beat his poor life out on the smooth rounded pebbles.

Remedies for Mosquito Bites

The most satisfactory remedy known to the writer for mosquito bites has been moist soap. Wet the end of a piece of ordinary toilet soap and rub it gently on the puncture, and the irritation will soon pass away. Household ammonia, or alcohol, or glycerine have been tried by others with good results. Some mark the puncture with a lump of indigo; some with one of the naphthaline moth balls; another, iodine. Others recommend the holding of one hand to a hot lamp chimney to relieve the irritation of mosquito punctures.

A great deal has been written concerning the properties of certain growing plants which are recommended to keep away that arch pest, the mosquito. Among these may be mentioned several species of eucalyptus, the castor-oil plant, the chinaberry tree, and others. Although the evidence in regard to these plants is contradictory, all observations made by scientific men in different parts of the world negative their value; claims that they are valuable are confined to people who have not made thoroughly scientific tests.—T. H. H.

The English Sparrow

The English sparrow among birds, like the rat among mammals, is cunning, destructive, and filthy. This species of the bird family was introduced into America a little more than sixty years ago, now being distributed over nearly the whole of the United States and southern Canada. This rapid dissemination is due to the bird's hardiness, extraordinary fecundity, diversity of food, aggressive disposition, and almost complete immunity from natural enemies. Sparrows are accustomed to feed in close flocks, and when thus assembled in favorable places a large number may be

killed by a charge of No. 10 shot. The best way is to scatter grain over long narrow areas and shoot the sparrows at these baiting places. Where sparrows infest poultry yards, the bait may be placed on a horizontal board, supported at such an elevation that the birds may be shot without danger to the poultry. These feathered mischief-makers are becoming so numerous that we should inaugurate a campaign against them. How about setting aside a “sparrow day” and kill off as many of them that day throughout the country as possible?—T. H. H.

ALFRED O. PHILIPP

TAHAR was happy. As happy and contented as a turtle could possibly be, for the hot sun which brought sweat and misery to unlucky humans clad in unnatural raiment brought only contentment to him as it beat fiercely down upon his hard shell.

Pine Lake lay calm in its summer glory, not a ripple marred the tranquillity of its glassy surface; but it could be bad, even very bad. Although only a mile wide it had a mean length of five times that, and when the wind became angry it spent its bluster on that sweep until the white-capped waves in a perfect fury chased one another from shore to shore. Duck hunters who came to slay in the fall often likened it unto the Great Lakes.

But the cold, wintry wind was a thing remote, and had no place in the mind of Tahar as he dozed on the flat surface of a projecting rock. For he was the monarch of the lake region as well as its oldest inhabitant. Even Kara, the great pike who struck fear

into the hearts of the smaller tenants, held no terror for him. Indeed, he was old when Kara was no larger than a perch, and used to hide in the pickerel grass over near the rushes.

True, he was quite immune from danger by virtue of his great shell, into which he could draw his head and legs at its first approach. Yes, he could hide—but he never did. And no other creature in all the lake could compel him to withdraw into his shell did he will it otherwise.

But outside the lake. Ah, that was different, for there Tahar had seen strange things. Big monsters with four legs like himself, but with hair on their bodies, great horns on their heads, and from whose throats issued terrifying sounds that sent him scurrying into the deep mud where he buried himself from sight, were roaming about. How was Tahar to know that cows were harmless?

Then there were the feathery things that floated through the air as easily as Kara swam in the water. But most marvelous of all were the queer

creatures that walked on two legs. Wonderful things had Tahar seen them do. Once from a point of vantage he had seen one of them slay Orad, the muskrat, with a spurt of fire and a noise like thunder, also—

Tahar suddenly became alert. He was extremely wise as the chelonian standard of wisdom goes, and as he had heard oars gently dip into the water before, he was quick to recognize from afar the faint, but regular splashes. He waited, and soon came another sound, one that he had long learned to associate with those wonderful bipeds—the sound of the human voice. Away down the shore, hidden by a clump of reeds, was a boat containing three men in continual conversation. To Tahar, however, their words merely signified the advance of an enemy.

"Well Bill," one was saying, "how does Pine Lake look to you? Same as ever?"

"Just about," answered the man addressed. "It's twenty years now since I left the old place to make my pile in New York, but it seems only

yesterday. Some changes, of course. That 'dump' on the other side that looks like the back yard of a tin can factory used to be our swimming hole in the old days. And behind that bunch of grass there used to be a flat rock sticking out of the water. I remember how, when I was only a kid—I caught a young turtle on that rock. I took him home and made a pet of him; and he really became quite tame. I kept him nearly all summer and then my mother made me get rid of him. So I carved my initials and the year upon his back. 'W. J. H.—1893,' and put him back into the lake. It was—"

The sounds were coming nearer, and in his own way Tahar evidently considered discretion the better part of valor, for he pushed himself clumsily from the rock and slid into the water. And besides, he suddenly longed for the willows at the end of the lake, as there were ever choice bugs to be found down by them.

But what were these strange, stringy things that completely enmeshed his body and entangled his head and legs. Tahar could easily force his bulky shell through the thickest of the grasses that grew in the lake. But this was no grass. It was altogether a new experience in his life. But Tahar was great and strong and would soon bite and claw his way through this strange thing that temporarily restrained him, for was he not monarch of the Lake?

Just beyond lay the long yellow strip of sandy beach that stretched from his favorite rock to the edge of the willows. But to Tahar it was quite inaccessible for the more he bit and clawed the more entangled he became. The sound of splashing oars drawing nearer, added a new zest to his furious struggles, and he was in a perfect frenzy when a shadow passed over him and he felt himself being drawn to the surface.

Up he went until a human hand reached over the side of the boat and grasped one of his hind legs and commenced pulling him over the gun-wales. Tahar snapped at the hand and was rewarded with a cruel rap on the head with the butt of a fishing

rod for his efforts. Then, with a hard thump, he landed in the bottom of the boat.

The three men eyed their prize with exclamations of delight.

"Ain't he a beaut?" exclaimed one. "Th' ol' boy wuz jes' taking' his daily sun bath, an' I knowed we'd ketch him if we put th' net on this side o' th' rock an' rowed up from th' other side."

"Yes," said another of the trio, "and now Bill will have some good old-fashioned turtle soup that he will long remember when he goes back to the city."

But the man named Bill was silent. Into his eyes came a gleam of recognition. He had seen something that had escaped the observation of his companions.

While the other two were occupied in hauling the net into the boat, he seized the opportunity to scrape the slimy growth from the shell of Tahar. And what he found beneath the slime completely justified his expectations.

The net stowed safely in the prow of the skiff, it was decided to row around the bend into the deep water and cast shoreward over the long weeds for pike or pickerel.

But the man named Bill evinced no interest in the casting as he sat in the stern gazing silently down at Tahar, for a flood of memories surged into his brain and carried him back to his childhood days. The dear little white haired mother and the cottage on the hillside. The old family horse, the rickety carriage, and the drive to church of a Sunday. Then there was the brindle cow that persisted in becoming lost in the swamp at milking time. And the shepherd dog. Then came a picture of a little bare-foot boy with sun-browned cheeks vainly trying to fashion a crude harness for a pet turtle.

It was unbelievable; but there could be no mistake, for here was the evidence before him. He had cut broad and deep, and nature's attempts at obliteration were futile, for on Tahar's leathery back could be traced the outline—"W. J. H.—1893." It's a funny world, he meditated. The

family horse was long dead. The brindle cow and the shepherd dog likewise. But here was the old turtle, and now he was going to eat it in soup.

Now the caprices of Fate are beyond the comprehension of man. For that Kara, the pike, should be instrumental in saving the life of his hated enemy while losing his own was paradoxical, but true. For Kara was lying half in the grass merely waiting for something to happen to break the monotony of a drowsy summer afternoon.

And it happened. A plump young frog came sailing through the air and landed with a splash just outside the fringe of the grass. Kara was upon it in an instant, seizing it broadside between his powerful jaws. Turning, he lunged for the grass, at the same time turning his prey in his mouth in order to swallow it head first. For there is a correct method of doing everything; even of swallowing a frog.

But something occurred that had not been upon Kara's program, and the battle that followed gave eloquent testimony to the stuff that American game fish are composed of. For thirty minutes Kara fought furiously. Time and again he was brought almost to the side of the boat by one of the men while another stood ready with a landing net, but it was only to break away again.

The man named Bill took no part in the proceedings. Another matter demanded his attention; and while the reel hummed and sang Tahar was firmly seized by his short, stumpy

tail, lifted over the side of the boat, and gently lowered into the water; where he lost no time in disappearing.

Kara finally succumbed and was drawn over the side of the boat just as Tahar had been but a brief hour before. His captors were delighted. No such pike had ever been taken from Pine Lake before. And ere the three men arrived at the landing it was fully decided that Kara would be sent to New York to be mounted by an expert taxidermist.

When the fishermen arrived at the

shore the disappearance of Tahar was discovered, and loud were the lamentations of the three men at the discovery of their loss. But somehow or other—maybe it was only imagination—the voice of the man named Bill did not seem to possess the proper tone of regret that the occasion demanded.

Down at the bottom of the lake buried deep in the mud, lay Tahar. He was still the monarch of the lake and its oldest inhabitant.

GEORGE GILBERT

(Concluded)

IT was mid-afternoon. As the hotel's company listened to the noise of the storm, now and again discussing such meager gossip as was brought in by a villager who was able to plough away through the snow to the centre of attraction—a warm bar room, where other males were congregated to talk—when a shout outside attracted their attention:—

"Whoa, there, you long-legged, double barreled alligator," a rumbling voice gave forth.

"Jim Breidin, in for a drunk, by

saltpetre and prunes," announced Johnson, getting up hastily. "Here you, Barker, get out and take care of his mule. When he hits town the bar's kept busy. That mule of his'n'll get through any snow."

There was some licking of chops as the commotion outside increased. It subsided in front, only to break out around near the stables and then became stronger and stronger as the center of it approached the hotel.

"Whew-up-eece," yelled a tall, thin, brown-bearded man, slamming the door open and striding into the

bar room. "Al as wants a drink come up with me."

"Excuse me, stranger," said DuPointe, stepping up and offering his hand to the new comer, "but suppose we have a drink on me."

The bearded man stepped back, gazed at DuPointe searchingly for a moment. DuPointe saw in his glance that *something* he had been searching for in the others. Here was a man reckless, headstrong, probably fairly decent when sober, but cruel and mean when drunk. It was with the bluff heartiness of the spree drinker who is bent upon finding companionship for a carouse that Breiden shook DuPointe's hand and accepted his invitation to drink.

As the knot of men gathered before the bar and the bottle began to circulate, DuPointe managed it so that he was close to Breidin, to whom Abner Johnson already had imparted the facts in "Perrault's" case as he knew of them.

"Hi, Peerow, Peerigh, Peerum," the mountaineer said, whacking DuPointe familiarly on the back. "Don't let a little matter like a rifle bullet in your leg worrit you. I've had 'em singin' around my ears many's the time when I've been toting deer out of season with the game constables after me."

The laugh went around at the expense of the roisterer as he thus made fun of himself. His troubles with the game wardens were well known, but none of those present would have referred to them if he had not first, for such is the etiquette of the poacher.

"How did you get through from lower Rainbow?" asked Johnson. "I should think you never would have made it to-day."

"That darned old mule of mine can go anywhere a bird can fly er a fish swim," he boasted.

"How's the gal?" asked Barker, just in from the stables with the report that the "muel" was eating his oats well.

"You never mind about my gal," Breidin said shortly.

"Last time he was in," whispered Johnson to DuPointe, "he had his

young darter with him and he made her dance on the bar for the crowd and when she cried he whopped her. Her mother's been dead two or three years and she keeps house for him at his place on lower Rainbow."

"I heerd you whusperin' thar about my gal," Breidin bristled up at Johnston. His bony, huge fist came down on the bar, making the glasses and bottles jump. "You quit whusperin' about her. She's not fittin' to come ouat with me no more. When a gal'd ruther stay home than go to toawn with her daddy, somethin's wrong wi' her," says I. "Let's have another drink."

This proposal was well received and others like it, as well.

"See anything of John Aylesworth?" Johnson asked Breidin, after a time.

"No; whar's he, the skunk? He caught me last year a-whopping my gal with a hame stop an' stopped me. But it didn't do her no good; I gave her double dose when he was gone from my place. 'Blast all sich meddlers,' say I."

"I agree that a man has a right to discipline his own children," said DuPointe ingratiatingly.

"Noaw I like to hear a man talk up like that; let's have another drink," said Breidin loudly. The whiskey was beginning to affect him, together with the warmth and the companionship of the other drinkers. He had pushed his round pull-down fur cap off his forehead and taken off his big knit wool mittens. His heavy double-breasted blue coat was thrown back.

"I've got a real good bottle up to my room," DuPointe suggested to Breidin at the first favorable opportunity.

"Noaw you're talking sense," the wild fellow slyly said. "Lead the way to it."

A little later DuPointe had his man upstairs. He had included Barker and Wagner in his invitation and by evening had established himself in their good graces.

By evening, DuPointe, by spending money here and there for whiskey, by his ability to mix with all sorts of men, had made himself a general

"He had his young darter with him and he made har dance

favorite. He managed to keep Breidin near him and when it came time to close up the hotel he, quite sober, so managed it that he took Breidin to bed in his own room, the two

reeling off together to rest. To Breidin's suggestion that he (Breidin) would have to go home in the morning, DuPointe interposed objections, saying that he had plenty of money to

on the bar for the crowd and when she cried he whopped her."

continue their carouse. He trusted to the storm to make it easy for Breidin to comply with his wishes.

It was in the hotel stables next morning that DuPointe found the

right opportunity to present the matter to Breidin in secrecy. They had managed to get away from the others for a time on the pretext that Breidin wanted to show DuPointe his

"muel." The wounded leg was giving him little trouble.

The snow had ceased in the night. Friday had dawned fair.

"A good two-foot-and-a-half," Breidin announced, "and maybe more to come. That means big drifts all down the woods road along Rainbow and blocking all the small trails."

He was uneasy. Several times he had made references of his intention to return home. Then, when the others noticed his remarks, he renewed his drinking and evaded all references to his home-going.

With his keen insight into men, DuPointe sensed that there was some deeply concealed reason for Breidin's uneasiness. He did not join in the jests leveled at his companion and adopted toward him an attitude of confidence that had its effect. With all his drinking, Breidin did not become much intoxicated. Johnson had warned DuPointe that the mountaineer's capacity for whiskey was almost limitless.

"As long as he don't get too much, he's jolly and not apt to get tangled up, but when he gets 'way drunk, he's nigh helpless and ugly as a wolf," the hotelman said.

"Breidin," said DuPointe, as the two stood watching the mule, "how would you like to have a share in \$25,000?"

Breidin spat out the straw he was chewing and turned to face the other in the dim light of the old stable.

"Say that again, man," he invited. His jovial air was gone. His shoulders lost their slouch. His little, shifty, grey eyes were intent in their gaze.

"How would you like to have a share in \$25,000?"

"How would a purty gal like to dance with a handsome beau? How would a boy like to lick out a pan his ma'd had cake batter in? What's the end of it?"

"Suppose I could bring you in with me on a plan to get a black fox skin that will sell for \$25,000?"

Breidin took a step forward and looked down into DuPointe's eyes. The schemer bore his scrutiny steadily.

"What we got to do for it?"

The mountaineer's inquiry came cold, hard, calculating.

DuPointe hesitated before replying:

"Maybe kidnap a woman and make her tell where it is."

Breidin laughed.

"I thought you was a-goin' to say something serious," he sneered. "I'll tell you, Peerow or Peerigh, I've done something darned lately that's going to take a sight of red lick to keep out of my mind. Give your animile a name and I'll hop to it with you."

"Not here; in my room to-night. I'll tell you all about it there. We'll need some help——"

"Why not us two alone and then not have to divide the profits into more'n two parts?"

"We'll need two more. But we needn't take them on the inside. I've settled in my mind upon Barker, the hostler here, and Wagner, that big farmer."

"Two likely fellows, but not sharp——"

"We don't want the other two to be too sharp, Breidin——"

"Ha, ha, ha, good for you," the other replied.

"But come on to my room and there we can talk it over, with some more of that good whiskey to make the talk flow easier."

"Your talk is the most sensible I've heard this long-come-short; come along; the sooner the quicker."

CHAPTER XI.

Early as Aylesworth awakened after a fair night's sleep, following the recital of Agnes DuPointe, she was up and about the cabin when he made his first attempt to use his numbed leg. The injured member still was very weak and painful, but it showed improvement. He managed to hobble to the door and looked at the weather.

"It will come on to snow again, big, to-day," he said, a note of anxiety in his voice.

She came and stood beside him.

"Yes," she agreed, with the assurance of the out-of-door woman. "The weather signs are right for snow again."

She hustled about making a little coffee from the grounds left in the pot from the night before. This, with a bit picked up here and there finished up their food and then they faced the question that they had failed to answer the night before.

"It all comes to this," he said. "We must get to my place. The big snow will be here before you can get to Stratho over the hills, even if I'd let you go."

He stopped, startled to find himself putting a veto upon her actions and looked to see if she had resented it. Apparently she had not noticed the remark.

"The numbness has gone out of my back," he went on. "If you can draw what of your things you need or carry them, I think I can manage to inch along to where the dug-out is. That will take us to within a mile of my cabin and from there to my place it is all easy going."

"If he had left me my food, I could stay here," she said, her elbows on the table, her face in her cupped hands. "As it is, I must take your advice. Perhaps once at your place a way will offer itself so I can get outside——"

"Oh, in a day or two I'll be all right and can snow shoe out and get help to get you out."

Their preparations were soon made. Aylesworth found that the exertion of getting ready bettered his condition. With a stick to lean on he was able at times to give her a tug on the traverse over hard places.

Not long after they left the cabin the snow began to fall, a little at a time at first, as all big snow storms begin. Before they were half way to the head of the marsh the big flakes were swarming thick and fast and covering up their trail. They found the dugout and Aylesworth soon fashioned an extra paddle from a dry pine limb that he got out of a windfall and flattened deftly with his ax. He could paddle well, despite his wounds and with the wind at their backs they made rapid progress down the center of the marsh.

It was snowing very hard when they came to the marsh's foot. From

there on to the cabin of Aylesworth they had a harder task than above, as the heavy snowfall slowed their progress more and more and Aylesworth was becoming somewhat weak. His companion, hesitant and depressed early in the day, worried and downcast, gradually threw off her low spirits as they fronted each difficulty of the trip and as they neared the cabin of the trapper, Aylesworth heard the woman humming little tunes to herself—snatches of voyageur's songs—as she marched. When snoozer came near she stooped and pulled his ears.

"You are cheerful enough to suit any one," the trapper remarked, as the cabin was sighted.

"Why not?" she flashed at him, turning to smile.

Arrived at the cabin, Aylesworth hobbled in, after throwing out the drifted snow from before the door. Mrs. DuPointe soon had the cabin in order, and Snoozer, in his old place by the stove, sniffed in anticipation of some more flapjacks and bacon grease as she went about the task of preparing the evening meal.

Aylesworth in his seat, watched her, with a rather rueful expression on his face, rubbing his three-day stubble on his chin the while.

"If I was more able, I'd do that myself," he said. "and if you'll put the dish here and the flour, I'll manage to stir up the pancakes. My arms are good, if my leg isn't."

She laughingly handed him the dish and the flour and water and he began to work. She began to set out things from the rough cupboard, as he directed.

Suddenly Snoozer started up and went toward the door. First he growled, then scratched at the sill.

"What is it, old boy?" Aylesworth asked.

Again the dog growled.

"Some one is out there," Aylesworth said. Already his companion was at the door.

"Shall I open the door?" she asked.

"Yes, but first hand me my gun."

In view of his own condition he had left it with her on the tramp down.

She handed him the gun and he sat, facing the door.

"Now, open it," he commanded.

She swung the door wide and Snoozer dashed out into the storm. They heard him bark, but not in anger.

"Go out and see what it is," Aylesworth urged. "I'll stand by the door and watch."

He got up and hobbled forward. Already she had gone.

He saw her plunge through the snow, now up to her hips, to where Snoozer was, under the lee of the creek bank. He saw her go over the bank and then waited, ready to flounder to assist her, if called.

Soon the dog came up the bank, pawing his way through the snow. Then Aylesworth saw Agnes' head as she struggled up, then her body, and after her, staggering, numbed with cold, a girl of twelve years.

Half carrying the girl, Agnes came forward.

"Oh, Mr. Aylesworth," the girl said, weakly. "You will take me in, won't you?"

"Why it's Mary Breidin," said Aylesworth, as the two came nearer. "How do you come to be up here in such a storm?"

He limped to the girl's other side and together they got her into the warm cabin. Here she soon revived, after drinking hot coffee. She was a pretty, fair-haired, rosy cheeked little miss, with a touch of rougishness, that showed when she felt safe.

"Now tell us all about it," Agnes encouraged, after she had patted Snoozer and thanked them both.

"Oh, Mr. Aylesworth, it's too terrible! Ever since father had me last in to Stratho and I refused to dance for him in the barroom and you caught him whipping me with the hame strap, he's been more and more ugly to me and drinking worse and worse. This morning he started for Stratho and he tried to make me go with him, but I wouldn't and when he chased me, I ran out of the house and into the woods. I hoped he's let up on me, but he didn't and after he had sat on the front door sill and drank up all the whiskey

he had with him, he started for the barn to harness up the mule and I tried to creep back, but he heard me and caught me and tied me up and threw me into the mule cart. He said he'd take me in to Stratho and that I'd dance on the bar for the men or he'd give me what for.

"All the way up the road it snowed and I was cold. He paid no attention. He was getting drunker'n, drunker all the time.

"Down where Otter Creek comes in I got desperate with cold and fearful, he was so crazy with his songs and I got my hands loose and untied my feet and got out of the back of the cart. He saw me as I went and cursed me and ordered me back. When I asked him to take me home he drove off and left me in the storm by the side of the tote road.

"After he went I sat down by the creek side for a long time and then I thought if I came up here, maybe you'd take me in. I started up, and the snow wasn't so bad then. I came up to the cabin, and found you gone and then I was afraid, 'cause I thought I'd have to stay all night in the open, but I crept out of the wind under the creek bank and I was getting colder and colder there, buried in the snow, when I had a notion I smelled woodsmoke and I thought you might be back, so I hollered and——"

Her golden, curly head nodded. The exposure, followed by the warmth and food, had done their work. The little one, her head pillowed on the bosom of Agnes, slept.

CHAPTER XII.

It was at dawn on Thursday that Jean Carlac broke the thrall of his fitful slumber and came to consciousness in a world in which no sound smote upon his ears. The wind had gone down. He had not undressed. A single shake of his huge body, as a dog shakes his pelt when he gets up after rest, sufficed for him. The view from the window did not satisfy, that from the door less still. For the snow was coming down yet in big flakes that said plainly: "We are but a few of many."

Carlac found no food, despite a keen search of the place. He had just a little left of his own, but was not at the end of his resources. His keen eyes told him the meaning of several marks in the snow in the lee of the cabin, where little snow had drifted since the evening before. Floundering back there, he found in the space under the cabin a pair of Great Northern hares, holed up to escape the storm. Venturing to the edge of their voluntary prison, they had left the tell tale marks. Carlac's pistol soon made them available for his uses.

Breaking his fast on a hastily made stew of hare's flesh, Carlac sat down to smoke, to think. But not for long.

In a corner he found a rough splint broom. Using a board wrenched from the table top as a shovel, he got rid of the snow in front of the cabin for a dozen paces. Then he swept the snow carefully out of the tracks he found underneath the newer snow.

Working so, in an hour he had worked out the general direction in which the ones he sought had left the cabin. Not being familiar with the country, he had no means of knowing where the two were bound. Noting the marks of the stick that Aylesworth had used to steady himself and that the man he sought was lame, and that the woman had drawn the traverse, he pictured in his mind the supposed DuPointe forcing his daughter to drag a heavy traverse through the deep snows for him. This only confirmed his own opinion that DuPointe was misusing Agnes and made him all the more bitter against her husband. What the stranger on the Stratho road had told him, what he had heard from Agnes' aunt through La Cerf, the tracks that told him his daughter was dragging a traverse, as an Indian squaw does for her brave, all went to complete the picture he held in his harassed mind of his "golden demoiselle" reduced to degradation and misery by DuPointe. And with this certain clue of the tracks to guide him and confirm him in his grim

resolve, he set about the business before him sternly and methodically.

He determined to wait until the snow was over. With his knowledge of trappers' habits he thought, not having all the signs before him, that DuPointe and Agnes had moved to some other location. It could not be far in that country of short trails. And if the man was lame, surely that would make for a short trip. Meanwhile, he must wait until the snow stopped falling.

To while away the time he got the big bear trap and using his shovel as a pry, forced the great jaw apart and set the pan and trap in their proper places. Then he stepped off and sprang the trap, joying to see it jump and to hear the huge toothed jaws come together. Again and again he did this.

He was up early the next day, scanning the heavens, the white carpet that lay all about him. The second hare he had cooked the day before and this he disposed, as best he could, in his clothing. The snow was over. Swinging the great bear trap, set, but with the safety catch on so it could not spring while it was being carried, over his shoulder, he took his axe, placed it in his belt and thrust his meat gun into his belt, as well and strode forth.

He had no fears for himself. He scorned the perils of this little wilderness. From the trail he had made out that the two he was after had gone down the vale. Floundering forward, he went that way.

Toilsome was the journey for him, but the toil eased the ache at his heart. The big snow had cut off all the wild folk in their travels. There was not even the merry chatter of a scolding squirrel to make the way more endurable for the man who went forward so with hate tugging him forward—hate that almost made him forget that before him also was the one he loved best.

At the head of the marsh he failed to find where his quarry had put out through the snowy sedges. But he sensed that they never would have come there unless they had had a boat to take them forward. Without

a boat there they would have skirted the marsh on higher ground. With the true woodsman's instinct he figured what the marsh meant on the trail. It meant that they would go through it and then follow the little stream at its foot. So with the marsh to guide him, he had only to edge over onto higher ground at its eastern side and go forward.

Silently as a lynx, he broke through the screen of little hemlocks at the end of the marsh. The lay of the land there told him what he wanted to know. Clearly the break of the big creek pointed to either a cabin there toward which the two had gone, or to a way out of the hollow between the Nescopern and the range on the other hand.

There, on a little knoll where the hemlocks were low-lying, leaving bare spots under them, Carlac made himself a warm camp for the night, banked in with hemlock boughs and carpeted with them. The weather was fairly mild. The trapper of the long trails found it no hardship to sleep out.

The big bear trap he hung carefully up on a hemlock limb for the night.

He was ready to trap the bear!

CHAPTER XIII.

Early Saturday morning DuPointe and Jim Breidin, with Alonson Barker and Brite Wagoner, to the shouts of a number of roisterers at the Eagle, put forth from Stratho in a rough bobsled, drawn by the mule. In the sled were four pairs of snow shoes, procured by Breidin, Barker and Wagoner, with money furnished by DuPointe. The men had rifles or shot guns.

"We're going down to Breidin's to hunt," DuPointe told everyone. The quartette had the appearance of being half way intoxicated.

"Lay ye a pint ye'll tip over before ye git a mile doawn that old wood road," Mine Host Johnson yelled after them. The expedition was looked upon as a great joke by all the hangers-on about the Eagle. The people of Stratho had dug themselves out of the drifts, and the paths

about the little settlement were open and the macadam road was being opened from below to get the mail through, the phone had given out. But the small roads and trails still were piled high.

"We've got our pint here," DuPointe called back, flourishing a bottle.

This was greeted with a laugh.

But once off down the trail and around the bend, the party threw off their appearance of intoxication and the shrewd DuPointe began to tell them what each one was to do to bring the plan to success. It was Breidin who proposed going in by way of Otter Creek.

It was early on Saturday, too, that John Aylesworth stood at the door of his cabin, his snow shoes on, his fur cap pulled down so that the visor shielded his eyes from the snow glare made by the brilliant winter sun. The roof was steaming. The crows were calling. What few clouds there were scudded high, widely separated. Belting in his mackinaw, he slung the pack basket onto his shoulders, gave a cheery goodbye to Agnes DuPointe and Mary Breidin who came to the portal to see him off. Snoozer, who wanted to come, but who could not have made it through the snow, was sent back, disconsolate after he had wallowed a few yards into the smoother underfoot, to the turn.

"Good-bye; I'll be in Stratho by night and home to-morrow. You two will not be lonesome. There's no danger," he called to them. I'll find some way of getting you both out then."

His bad hip pained him some, but the exertion did it good. He carried with him the goodly picture the woman and girl made as they stood, side by side, their arms about each other. They had talked it out and reached the conclusion that with three to care for on a stock of food meant for one it was best for him to get in to Stratho before another storm came, perhaps to shut them in for weeks.

Every yard Aylesworth gained he felt better. Now that he was out

in the open, face to face with his troubles, he felt more and more able to meet and to conquer them.

But his progress was slow, for he had to favor the injured hip. He made his start as if nothing mattered and when around the first bend of the creek, struck a more even pace. This he held steadily, that he might not stumble and so strain the tender ligaments. At the turn where he had called to them he had gone from their sight, where rock and tree hemmed in the trail.

He struck the road at Rainbow Creek without mishap and had turned up it, toward Stratho, when he became aware of the approach of a sled, drawn by a mule whose appearance was familiar. He recognized it soon as that of Jim Breidin and the memory of the little girl, left by the wayside by the drunken man to die in the cold, came upon him, turning his blood to fighting heat.

Breidin was not alone. Three others were with him.

The men in the bobsled had seen Aylesworth almost as soon as he had seen them. When the sled came abreast Aylesworth, ready to first give Breidin a tongue-lashing and then tell him where his daughter was, did not draw aside much. He turned to face the four men, who seemed not to have noticed him, acting under Breidin's urging. But just as the trapper called, Breidin pulled in the mule and faced him, leering.

By Breidin's side Aylesworth saw DuPointe, the husband of Agnes, the man who had attacked her, struck her down. Her wish that he should not attack the man held him dumb as he remembered her appeal.

"Aylesworth, you dirty skunk," Breidin yelled. "I've ben waiting a long time to git you out in the open spaces so I could tot up my reckonin' with you. I'll larn you to interfere when I'm teachin' my offspring manners."

"Do you know where your girl is now, Jim Breidin?" Aylesworth asked. He did not flinch as Breidin began to climb down from the bob's seat.

"No, ner care, either, you hound."

Breidin lunged and Aylesworth turned to face him. His hip gave with him, he sank partly to one side. The other three caught him from behind, Breidin buffeted him in front.

In five minutes Aylesworth, his snow shoes stripped off, was bundled into the body of the sled and they drove on. From their talk, for they had grown bold now and let fall here and there scraps of sentences that Aylesworth pieced together, giving him a true insight into their plans, he made out that they planned to go to the cabin at the head of the marsh. But this gave him no hope, as he knew that his tracks would lead them to the lower cabin, his own. He raged inwardly, but had to remain quiet, a captive, while they urged the poor overburdened mule on until he came to where Otter Creek came into Rainbow. Then Breidin, and DuPointe together, putting on their snowshoes, left him prisoner, with Wagoner and Barker in charge of the sled, which they had made the mule haul a little way up Otter Creek trail, off the Stratho trail.

While Barker and Wagoner drank now and then, Aylesworth, chilled from lying still so long, felt his strength going from him as he racked his brains for a way out of his thrall-dom. After a time he began to roll back and forth in the body of the sled, if for nothing else, than to keep his blood going, as well as his bonds would permit.

This angered the two and they came and stood over him, threatening him with upraised fists if he did not remain quiet.

"Does you no good to ram 'round so in th' bob," Barker said. "Why-n't you be still?"

"Yas, better you vas sthille," Wagoner chimed in, poking at the captive with a hairy paw.

Aylesworth refused them the satisfaction of a reply. Bound, without a weapon, he felt helpless and the need for craft. So he pretended to heed them and did quiet down.

The two men turned and leaned against the bob as they talked drunken nothings, disputing about little backwoods notions, as such

men will when in drink. One of their bickerings led them to a friendly scuffle, in which they jammed each other in turn against the bob. It was during one of these jostlings that Aylesworth felt something solid strike his wrist as he lay there on his back. The two scufflers reeled away from the bob. Raising himself as far as his bonds would let him, Aylesworth saw that it was Barker's dirk knife that had been jostled out of his belt into the bob while Wagoner had held the other pinned against the sled.

While the two continued their wrestling, Aylesworth doubled his body until he could grasp the horn haft of the knife in his teeth. Then, holding the edge of the blade upward so, he made a great effort and brought his wrists up where he could saw at his bonds, holding the knife firm with tightly clenched teeth, although the pain from the effort almost overmastered him.

As often happens in such cases, the fun the two half besotted men were having became more and more earnest. They whirled about in their wild efforts to out-wrestle each other. Finally Wagoner's bulk prevailed and Barker went down. Wagoner was bending over Barker, demanding if he had "had enough," when the loaded butt of Breidin's mulewhip struck him fairly on top of the head. Barker felt Wagoner roll off him and sprang to his feet to face John Aylesworth, knife bared, loaded whip upraised.

"Lonson," Aylesworth ordered. "You've always been a fairly decent fellow up to now, barring drink. Do you want me to finish you, or are you willing to do as I say, in return for my help in getting you out of this mess?"

Terror and hope alternated on the little hostler's face. He knew John Aylesworth to be one whose word was good to friend or foe.

"What d'ye want me t'do?" he stammered from between fear-blue lips.

"Take one of the harness straps and bind Wagoner and help me get him into the bob. Then remain here

until you hear from me. If not that, take your chances."

Stooping over, Aylesworth searched the stricken man. He took a pistol from him and put it in his own belt.

"If you give me your word to stand by me, I'll help you," said Barker, as soon as he saw the pistol in Aylesworth's grip.

"And remember, Lonson, I don't care especially whether you do or not. I've got this end of the game in my hands and I'm going to have the other pretty soon. But if you are here with him when I finish up beyond, it will go better with you."

"Give me this one chance, Mr. Aylesworth. I'm sobering up now and if it hadn't been for the liquor I'd not be in this scrape."

CHAPTER XV.

The vapors from his delusion rising more and more to becloud his reasoning, Jean Carlac aroused himself from his bough bed early that same morning and started down the little brooklet toward Otter Creek. The remainder of the hare he had to break his fast with, gnawing it as he went, holding the great bear trap onto his shoulder with one hand.

So it was that, after swinging wide to get onto rising ground to view the cabin and its surroundings after he came into position whence he could view it, he drew near to the bend in the trail where Aylesworth turned to wave good bye to Agnes and Mary Breidin. If Aylesworth had been observant that morning he would have seen the track of the old trapper coming down from the hillside toward the creek bottom, but the young trapper did not. Carlac saw Aylesworth, from a distance, as the younger man swung down the trail. He recognized him as "DuPointe" as described to him by the man he had met on the road to Stratho. The blind hatred against the man he thought had abused his "golden demoiselle" blazed up in Carlac's brain and heart and as he was too late to intercept Aylesworth, he settled down at the trailside to consider the situation. Why the young man had gone out over the trail he

had no means of knowing. That Aylesworth was bound for Stratho he could not know.

He had one or two moments when he was almost inclined to rush to the cabin and compel Agnes to come away with him. Then hatred counselled another course. He smiled to himself, swung the great bear trap down from his shoulder and put it in the trail at the bend. A tree butt on one hand and a rock that made the creek and trail bend there made it easy to make a good set. The good footing there was narrow. He took off his mittens and tripped the safety snap, fixing the trap so it would spring at the slightest weight on it's pan, having first sifted enough dry, fluffy snow over it to cover it. Under the little hemlocks there he saw the canoe, with "John Aylesworth" painted on it.

"There," he said, mumbling the words with fierce delight. "I am ready to *trap the bear*. He is here. He uses that name.

Underneath the curve of the bank the creek sang under its burden of ice and snow. It was a sheer drop of fifty feet there to the rocks. Open water showed, black and swirling, at the base of the rocks and an old log jam closed the pool's lower end.

"The bear will be caught off his balance when the trap springs," Carlac thought, "and will fall and the trap will drag him under the log jam."

A voice called: "Who are you? Speak or I shall fire."

Carlac straightened up. In his exultation he had shown himself around the bulge of the big rock. He had been seen from the cabin. He knew who it was that was challenging him. It was his Agnes, from the doorway. Love whispered: "Answer her." Hate said: "No."

Carlac dodged out of sight again and turned along the creek bed, keeping the big rock between him and the cabin. He had to go slowly on account of the depth of the snow. He found cover after a time in a clump of little pines and under them the footing was good and he made fast time. From them, too, he could

see that the cabin door was shut and that no one was astir there. He wanted to watch the trap, that none but the "bear" might feel its deadly jaws.

"So," he reasoned, "there can be no man in there or he would be out to investigate a stranger who slinks away as I have done. DuPointe has gone away for something and will be back soon, leaving Agnes alone. First I must *trap the bear*. Then we can see what is to be done."

It was warm under the pines in the sun glare and Carlac on the soft needles, was quiet, watchful. But as time went on and the down-trail was empty, the cabin still closed fast, he became uneasy and moved about under the pines. He came toward the trailside again and was just breaking through the screen of branches at the little pine grove's edge, when he heard:—

"Hands up."

Jean Carlac looked down into the muzzle of a revolver held by a lanky, sour-faced man. With him was the young man who had given him the information about "DuPointe" on the Stratho road.

The Canadian had seen death too close and too often to fear the result of resistance. He lunged forward. The revolver spoke. Jean Carlac doubled up, pitched forward, blood streaming from a great wound in his forehead that stained the snow.

"I never meant to do it," Breidin snarled. "I never meant to kill him——"

"Never mind that now. We've come for that black fox pelt and we're going to have it," said DuPointe shortly.

"He seems to be a stranger. I never saw him. Maybe there'll be no search for him."

"He's a stranger. I saw him get off an automobile near Stratho the day I came in. Some Canuck trapper that's drifted down here for the winter. No one will inquire after such as he is."

"We can bury the body when we get through with this other business."

They rolled him back behind the pine bough screen and after searching

him for money and finding little, went forward.

The two had lagged on purpose, aiming to reach Aylesworth's cabin toward late afternoon, hoping to catch the woman off her guard then while she would be at some chores that would take her outside. Beside the big rock they paused.

Into Jean Carlac's dim consciousness throbbing, grinding pain thrust, like a file going back and forth on a raw nerve. He started half up, fell back, drew himself forward by clutching at pine stubs and roots. Gradually his mind settled down to realities and then he staggered up, alert, but weak. The bullet had grazed his skull, instead of penetrating it, rendering him unconscious. For how long? He did not know.

As he came out of the pine screen to the trail he cast his eyes back and then ahead. A man was plowing along ahead, toward the cabin. *It was "DuPointe,"* and he was going toward the bear trap; toward the big rock that shut out the cabin from view.

But where were the two men who had attacked him? He felt it was his duty to get between them and the cabin. Men like that were not to be trusted.

He saw the trail, with one hasty glance, and knew that the two had gone on, toward the cabin. The snowshoed snow told its own tale, Carlac plunged forward. He felt his strength coming again. Soundlessly he went after the man ahead, who pushed on, as though urged by some strong purpose. *It surely was "DuPointe."*

"Le Bon Dieu, grant that I place my hands on him if the bear trap misses him," was the earnest prayer of the big trapper. "After he is dead, I can win over the other two and so protect Agnes."

But Carlac was too weak to keep pace with the other. The crisis came before he reached him.

From behind the rock appeared the genuine DuPointe and Breidin—barring the other's passage at the turn over the big pool. But before they could clash, the snow at Frank Du

Pointe's feet upheaved and with a ringing, grinding clash the immense jaws closed about his legs. He yelled with terror, pain; reeled, grasping Breidin, throwing him off his balance. Together the two plunged over the bank into the black waters. Alone, Aylesworth turned to face the big man who came swinging at him, lips drawn into a snarl as he closed. The two grappled, sinews straining and together reeled into the open space before the rock, in line of vision from the cabin's door.

Aylesworth, his hip weak, his breath almost gone from the final spurt he had made to be at the cabin before the others, taken by surprise at this onset from an unexpected quarter, felt his strength going, as he was pressed back and back.

"You I shall throw to the rocks," he heard the big man pant. Dimly he heard Snoozer's bark.

One mighty heave John gave, breaking the other's hold. They reeled apart and as they did so Aylesworth's hand fell onto the butt of Wagoner's pistol. He drew it, leveled it, felt the trigger yielding under the pressure as the other stood there, ready to spring anew. Snoozer, eyes ablaze, leaped for the big stranger's throat. Aylesworth hesitated, grew again tense.

"Stop, father: stop, John!"

It was Agnes, at the cabin door, crying to them her heart's appeal. His own name on her lips gladdened John.

Aylesworth's pistol fell to his side. He cast it away.

"You are Jean Carlac? he demanded of the big man.

"Oui, oui!"

"Then shake hands. There is a place for you in the cabin. Let us go there and talk this matter out. Snoozer, behave; don't you know a friend o' mine where you hear him lookin' at you?"

CHAPTER XVI.

It was April on Brule Pond. Peepers were chorusing, early birds nest-building, trout leaping for flies. Before Jean Carlac's cabin a man and a

woman stood, while in the doorway an older man and a girl idled.

"Father Jean," whispered Mary Breidin to Carliac, "I'm so glad you brought me up here for your girl. Do I do well with the housework?"

"Well, indeed," the big trapper commended, stroking her fair hair as she nestled against his side.

"Agnes, my Agnes," the other man was saying to the woman, as together they gazed off toward the shimmering radiance of the afterglow of the pond, "shall it be soon that I shall claim you? The money from the black fox skin has made

your father well off, for a trapper, so we need not worry for him. I have waited a year. Lafitte has confessed he was to blame, so your father is cleared. Again I plead. Haven't I waited long enough?"

"Yes, John Aylesworth," she said letting her head fall onto his shoulder; "It is time now. Let us go to father with the news."

And together, hand in hand, they went toward the big man and the little maid, through the mystic, tranquil, golden silence.

THE END.

L. SHERWOOD

MANY of our Canadian waterways afford trips which it would be difficult to surpass in the pleasures of picturesque and healthful out-door atmosphere afforded. Occasionally such a trip is worthy of record and when it marks the opening of a new route link and becomes of some historical value in the annals of Canadian waterways, its record value is somewhat enhanced.

On May 30th, 1918, the Canadian Government Steamer "LORETTA" left Ottawa and on June 6th arrived at Washago, on Lake Couchiching. Her route via the Rideau Canal to Kingston, the Gap and Bay of Quinte to Trenton and the Trent Canal thence to Lake Couchiching was for

the first time thus covered by steamer. The occasion was the formal opening of the Ontario—Rice Lake Division of the Trent Canal between Trenton on the Bay of Quinte and Hastings near Rice Lake. Although the beautiful waters of the Rideau Canal, the Bay of Quinte and the Kawartha Lakes or central section of the Trent Canal are well known to our tourists and our camping-out enthusiasts, the opportunity of covering this route on a continuous trip by steamer had not been afforded until the completion of the construction of this southern terminus of the Trent Canal.

The daily stages of the trip as made by the Steamer "LORETTA," a ten mile an hour ship, were as follows:—

Lock No. 2, Ontario—Rice Lake Division, Trent Canal. Lifts 20 feet. A typical lock of the new construction.

Ottawa to Narrows Lock, Upper Rideau Lake via Rideau Canal, Thursday p.m., May 30th, to Friday evening, May 31st.

Narrows Lock to Kingston via Rideau Canal, Saturday, June 1st.

Kingston to Trenton, via Bay of Quinte, Sunday, June 2nd.

Trenton to Healey Falls, via Trent Canal, Monday, June 3rd.

Healey Falls to Lakefield, via Trent Canal, Tuesday, June 4th.

Lakefield to Kirkfield, via Trent Canal, Wednesday, June 5th.

Kirkfield to Jackson Point to Washago, Lake Couchiching, via Trent Canal, Thursday, June 6th.

The Steamer "LORETTA" was unable to proceed further than Washago as the Severn River Division of the Trent Canal is under construction and incomplete for navigation; but the Severn River Route was covered by launches in the successive stages

of Severn Bridge to Swift Rapids on the evening of Thursday, June 6th, and Swift Rapids to Big Chute, Big Chute to Port Severn and Port Severn to Fesserton on Friday, June 7th.

The total distance from Ottawa to Washago via the route travelled is approximately 404 miles consisting of Rideau Canal 126 miles, the Gap and Bay of Quinte 75 miles, and the Trent Canal 203 miles. The lockages total 39 on the Rideau Canal from the Canal Basin, Ottawa, to Kingston, and 41 on the Trent Canal from Trenton to Lake Simcoe. Six foot navigation is afforded on the Rideau and Trent Canals except for the newly opened Ontario-Rice Lake Division of the Trent where a depth of 8 feet, 4 inches on the lock sills is given.

Lake Ontario is 243.40 feet above mean sea level, New York datum, and Upper Rideau Lakes, the summit level of the Rideau Canal is 409 feet above mean sea level. Balsam Lake, the summit level of the Trent Canal, is 840 feet above mean sea level.

The Rideau and Trent Canals are similar to the extent that they consist mostly of natural lakes and river courses connected by locks with the water held up for navigation by adjacent dams and the beautiful scenery on both is also similar and typical of the best that Ontario affords.

The Rideau Canal was built in the years 1826 to 1832 by the British Royal Engineers and with the Ottawa River was intended for the transport when necessary of troops and munitions of war from Montreal to the Great Lakes via a more protected route than at that time afforded by the St. Lawrence River along the International Boundary Line.

From Ottawa to Smith Falls the Rideau Canal offers but a small part

of the charm that is afforded between the latter town and Kingston. It is a matter of river navigation as compared with that of lakes and although the former is interesting and in certain sections quite pleasing, it fails to measure up to the lake scenery for sheer beauty. The vistas of water and islands, clad in their vernal spring colors, on such lakes as the Upper and Lower Rideau and more particularly on Newboro, Indian and Sand Lakes remain long in one's memory and it would be difficult to conceive of scenery of more surpassing loveliness.

The interest of the trip through the Bay of Quinte was accentuated by the sight of many aeroplanes in the heavens at the time of our passing the Mohawk Aviation Camp, near Deseronto, about noon. Nine were counted within sight at one time, and these were but a portion of the number flying that day. The Mohawk Indians of a century ago could hardly have foreseen by the wildest flight of their imagination what has been, during the last two or three years, an everyday sight on the flat lands of their Indian reserve.

Monday, June 3rd, marked the formal opening of the Ontario-Rice Lake Division of the Trent Canal

by the Minister of Railways and Canals, the Hon. J. D. Reid, and it was a most appropriate date as it was also the King's Birthday. The ceremonies were not of an elaborate nature. The steamships "Ramona" and "Loretta" left Trenton with all whistles blowing and all flags flying—these details applying to both town and steamships, at all new locks on the division passed that day until Healey Falls was reached that night—17 lockages—crowds of residents, rural and urban, greeted the progress of the ships that proclaimed the long delayed opening of the navigation connection between the waters of the inland Kawartha Lakes and Lake Ontario.

The term "long-delayed" warrants explanation and it is more easily understood when it is pointed out that certain original isolated locks of this canal were built some 85 years ago and that the canal has been in course of interrupted construction ever since.

The route of the southern terminus having been decided in 1906 in favor of the Trent River from Rice Lake to Trenton as against a possible route across country from Rice Lake to Port Hope, location surveys were commenced at once and in successive

Car on marine railway for launches, Big Chute, Severn Division, Trent Canal

years contracts were let for the various sections. The locks and dams are substantial concrete structures and at all the larger lifts are hydro-electric power developments which, with one exception, are controlled by the Hydro-Electric Power Commission of Ontario.

It is not within the intent of this article to enter into a full and technical description of the engineering designs and details of the canal works on this division but advantage of the occasion is taken to state that they are of the most modern design and of the most permanent construction and are a great credit to one of the most experienced of Canada's canal engineers, Alex. J. Grant, Superintending Engineer, who has been in charge since their inception in 1906.

Continuing with our particular narrative, the residents of the largest town, Campbellford, to be reached at about 6 p.m., on the opening day's journey, turned out en masse and greeted the Minister's arrival with all the pent-up enthusiasm of years and the power of the local brass band. The Minister made a short speech in reply to an address of welcome at the public wharf. But a short stay was made at Campbellford, the journey was resumed and the ships were finished locking through at Healey Falls by about 10.30 p.m. At this point the Trent Canal Steamer "BESSIE BUTLER" met and was added to the fleet.

The works at Healey Falls were inspected early on the morning of Tuesday, June 4th, and the trip was resumed, Hastings being reached about 11 o'clock. The afternoon's run through Rice Lake and the Otonabee River brought us to Peterboro where a complimentary dinner was tendered to the Minister and the official party by the citizens of that city. In a speech delivered on this occasion, the Minister expressed his faith in the Trent Canal, both on account of its transportation possibilities and also the development of hydro-electric powers connected with it.

This completed the stage of the

trip which constituted the formal opening of the Ontario-Rice Lake Division. The remainder of the trip was of the nature of an inspection of the rest of the canal carried out with the two steamers "BESSIE BUTLER" and "LORETTA." The "RAMONA" returned to Kingston from Peterboro.

From Lakesfield the scenery broadened from what had been mostly river navigation to that of the lakes. Clear, Stoney, Buckhorn, Pigeon, Sturgeon and Balsam Lakes all added their quota of scenic enjoyment and pleasant remembrances. Locking through the hydraulic lift-lock at Kirkfield after dark completed the journey for June 5th.

An early start on the morning of the 6th, and the canal section to Lake Simcoe was soon traversed. From Gamebridge, on the easterly shore of the Lake, the run was south-westerly to Jackson's Point where the Minister and immediate party left the steamers to return to Ottawa via Toronto.

The remainder of the party consisting of the Chief Engineer of the Department of Railways and Canals and Superintending Engineers continued the trip through Lake Simcoe and Couchiching to Washago, where navigation ceases for the time being or until such time as the Severn Division of the Trent Canal to Georgian Bay, now under construction, is completed. The steamers were left at Washago, but the Severn River route was covered by stages of motor boats.

Hydro-Electric power plants at Swift Rapids and Big Chute were of particular interest and the rugged and picturesque scenery along the entire Severn route, but particularly in Sparrow Lake and Gloucester Pool, proved most interesting.

The ultimate main canal terminal port on Georgian Bay will be Honey Harbor. A branch lock, affording 6 foot navigation, has been completed at Port Severn, and motor boat navigation, with the assistance of this lock and a small marine railway at Big Chute, is now open from Georgian Bay to Swift Rapids.

From Port Severn the trip by water was concluded by a motor boat run across the lower end of Georgian Bay to Fesserton on Matchedash Bay. A heavy windstorm provided plenty of thrills for a grand finale but the motor boat proved staunch and equal to the occasion.

On the whole the trip from Ottawa to Georgian Bay was one of great pleasure and delight and marked the inception of greater availability of part of our beautiful inland waters. Undoubtedly in the coming years more and more advantage will be taken of these water routes by the touring and "summering" public, and Ontario will have her reputation still further added to as a beautiful province.

To two classes of the community particularly should the opening of the southerly end of the Trent Canal prove peculiarly acceptable, motor launch enthusiasts and fishermen. For the former, by the opening of

this link, navigable trip routes become greatly increased and a most delightful range of possibilities for motor launch trips is opened out. For the fishermen, easier access to the well-known fishing grounds of the Kawartha Lakes district is afforded.

The writer counts himself a fisherman, not because of any particular expertness as such, but because of his enjoyment of the sport and he can record many most enjoyable hours spent in fishing in many of the lakes of both the Rideau and Trent Canal districts. Perhaps his greatest enjoyment and most successful results were obtained at various times lunge fishing on that stretch of the Trent River between Healey Falls and Hastings but a fisherman's great pleasure is not limited to his success in his catch of fish, he has the invigoration of the open air and the fascination of nature study which in themselves ensure both physical and mental enjoyment.

Value of the Skunk

Many states already have laws protecting the skunk by a close season. These laws were passed in response to the wishes of farmers who recognize the usefulness of these animals in destroying noxious insects and to the demands of persons interested in conserving the fur resources of the land. A more complete understanding of the economic value of these creatures would, no doubt, result in protective measures in all the states. Such legislation is vitally necessary, if we mean to avoid trapping and shooting them to extinction. Persons interested in the preservation of game often denounce the skunk without mercy, asserting that it destroys pheasants, quail, grouse, and other varieties of game; and sportsmen's clubs usually encourage the destruction of skunks, classing them with foxes, minks and weasels as enemies of game. Sometimes side hunts are arranged for the destruction of "vermin," and in some places bounties are paid for

killing these animals. Biologists of renown tell us that so far as skunks are concerned, there is little evidence that they often disturb game. Byron Andrews, of Erwin, S. Dak., once found a pinnated-grouse nest containing eggs about to hatch less than four rods from a den that had long been in use by skunks. Mr. Andrews argued that the skunks surely would have destroyed this nest had they been fond of eggs. I have often heard of quails that nested and hatched out broods within a few rods of a skunk den. Sometimes crows will eat these eggs and mayhap the skunks get the blame for the outrage. It is stated by D. E. Lantz, Assistant Biologist of the U. S. Department of Agriculture, that at the time when the native birds are nesting, skunks have abundant insect food, and by the time this food falls short the birds are strong of wing and seldom fall a prey to this mammal.

Off on a canoe trip, Smoke Lake, Algonquin Park

The Beverly and Newboro' Lakes

TYETH BOUNSALL

An Old Country Angler

IT is an old and true saying that "Many Men have Many Minds;" and this certainly applies to the followers of the gentle craft. A large number of my angling friends having once discovered a spot where there is generally good sport, and where accommodations, etc., are pleasant; make up their minds to stick to it, and you will find them at their old haunts season after season! I am inclined to think that I must have been born under a very wandering star; for, no matter how well a place suits me, or how good sport I may have had there, I am like Alexander; always looking for new worlds to conquer!

Regular readers of *Rod and Gun* will doubtless remember that my steps have been turned towards the various lakes in Northern Ontario for the past three seasons; but this year I determined to try another direction. I had heard a good deal, indirectly, of the sport to be obtained on the Rideau chain of lakes, but could find no one amongst my own circle of angling friends in Toronto who had any practical experience of them. However, early in July last,

a New York friend of mine sent me a small leaflet about Delta; a little Ontario town situated between the Upper and Lower Beverley Lakes which form an outlying portion of the Rideau chain. Certain enquiries made through the station agent at that spot, and reference to the Canadian Northern's book "Where To Fish and Hunt," determined me to give Delta a trial at any rate; and I certainly had no reason to regret my decision.

A sultry Sunday night early in July found me enroute by the 10 p.m., express from Toronto, which deposited me at Forfar Junction in the small hours of the Monday morning with three hours to wait for a connection on the branch line which runs from Brockville to Westport, and on which Delta lies. As an old Devonshire friend of mine, when ordering a substantial lunch to be packed up for us on our Dartmoor fishing excursions used to say—"shelves on the river-side are hung very high;" meaning that we should be absolutely dependent on what we took with us as far as feeding was concerned. This expression applies to Forfar Junction;

but I was lucky enough to run across a friendly "section boss" whose good wife provided me with an ample breakfast of bacon, eggs, and fried potatoes at the section house, near the station, and I think those who may follow in my footsteps would have no difficulty in obtaining the same accommodation. Delta is about half an hour's crawl from the junction; a very thriving little place too, situated in the midst of a rich agricultural district. It reminded me more than any other place in Canada has hitherto done of some of our little towns in the west of England. Except on Saturday nights it is a regular Sleepy Hollow, but then, for a few hours, it wakes up. An enterprising man from Brockville opens a "movie" show in a disused warehouse for that night only; and the proprietor of the solitary "ice cream parlour" imports at least two extra cans of his specialty to meet the additional demand! The girls and boys from the farms for miles around come in to the village on the Saturday night; and the collection of "Tin Lizzies" (and some high-class cars too) is really remarkable.

The Upper and Lower Beverley Lakes are connected by a creek which flows through the village and is navigable for small boats to a point close to the Upper Lake, where a mill dam crosses it. From the village to the Lower Beverley Lake is about half a mile, and it is a great convenience to be able to step into your boat within 50 yards of the house in which you are staying. I put in rather over three weeks most enjoyably at Delta and was greatly surprised not to meet a single angling visitor from the western part of Ontario during my stay. In fact there were very few visitors (angling or otherwise) at all, and most of these came from across the border.

The lower Beverley Lake is one of the prettiest bits of water, from a scenic point of view, that I have come across during the seven years I have been in Canada. It is beautifully wooded; and the timber having been untouched, either by fire or the activities of the lumberman, retains

its pristine glories. There are several small islands in this lake, the best part of which, (from an angling point of view) being what is locally known as "The Narrows;" a branch which runs up for about three miles to the westward from the main lake, with an average width of half a mile or so. There is also a wide, navigable, creek leading to Lyndhurst; in which, although it is greatly overgrown with weeds, the fishing is good. This lake always reminds me of a part of the famous Harbor at Sydney N.S.W.; "The Narrows" being especially like the Paramatta River.

I enjoyed exceptionally good sports all through my stay, and was surprised at the size of the fish I killed, in fact after my first day I seldom kept a bass under two pounds in weight! My largest bass weighed just over six and three quarter pounds by the spring-balance which always finds a place in my fishing kit; whilst bass of four pounds and upwards were quite common occurrence. Most of my fish were killed whilst casting, and this is the first season in which I have made use of any of the "wobblers" which have come so much into vogue of late. The local fishermen pin their faith to the "Dowagiac" pattern, and it certainly is a killing bait; I found, however, and rather to my surprise I must own, that a large-sized (white with red tip) Rush "Tango" Minnow was even more attractive than the Heddon make. I had brought one of them with me, more as an experiment than anything else; but its success was so marked that the local anglers gave it the name of the "Kill Devil!" One peculiar experience with this bait is worth recording. Late one evening, when the bass were lying close to the reed beds, I made an overcast which resulted in the "Kill Devil" taking a couple of turns of line round the stem of a bulrush; from whence it hung a few inches above the water. Being unable to clear my line by jerking it I got the lad who was pulling me to bring the boat close in-shore; and, when we were within half a dozen yards of the reed-bed; the bait suddenly

dropped into the water, its fall being followed by a vigorous commotion at the foot of the bulrush round which it was twisted. On coming close in, I found that a large bass had actually taken the bait as it dropped into less than six inches of water, and was able to get net under him and land him! The weight of this fish was four and a quarter pounds, and I have never previously caught one under such unique circumstances. Frogs are plentiful and make tempting baits. Minnows have to be fetched from some distance, and their price (\$2.00 a hundred) makes them rather expensive. I killed some good bass on the "Pilot" flies to which I alluded in an article which appeared in *Rod and Gun* last year concerning fishing in the Bolger Lakes. Pike fishing is also good, although the pike here run very small according to English ideas; a five pound fish being rather the exception than the rule. In many waters at home (such as Virginia Water in Windsor Great Park, etc.) the minimum size of pike allowed to be killed is five pounds, whilst the average weight would run to ten pounds or even more. My own record in English

waters was a pike of eighteen and a half pounds, the mounted remains of which may still be seen in the Billiard room of the golf club at Sunningdale, about thirty miles from London. On one afternoon when bass were not biting freely I made a deliberate campaign against "*Esox Lucius*," with the result that in just over two hours I had accounted for over 30 good fish; mostly killed with an ordinary spoon bait.

During my stay in this district I spent a few pleasant days on the Newboro' Lakes, making the village of that name my headquarters. On the evening previous to my departure from Delta I had the misfortune to lose one of the best split-bamboo casting rods I have ever possessed; dropping it overboard in the deepest part of the Lower Beverley Lake, from whence it proved irrecoverable in spite of all kinds of dredging, dragging, and even diving. The result of this accident was that I arrived at Newboro' next morning minus a casting rod and reel, but plus a considerable amount of faith in Providence as to providing me with suitable tackle! On stating my woe-ful case to Mr. H. J. Scott of the Rideau Hotel at Newboro', he prompt-

ly assumed the role of the Good Samaritan by lending me his own private rod and reel which I used during my stay.

The Newboro' Lake differs slightly in character from the Beverley Lakes in that it is, one might almost say, "crowded" with small islands. These islands are so numerous, and resemble each other so much, that a stranger might very easily get lost amongst them; and I certainly should not care to trust myself far on this lake without a guide, especially after dusk. During my stay at Newboro' the weather turned cold and unpleasant, but in spite of that I killed a fair number of good sized black bass and a good many pike; the "Kill Devil" proving as tempting at Newboro' as it had hitherto done at Delta! For the angling visitor who requires most of the comforts of a home whilst away from his own, I should recommend Newboro' in comparison to Delta. I found unusually good accommodation and service at the Rideau Hotel, and can also recommend the boatman who attended me (Michael Murray) as a reliable man who knows his business. The charge made here (\$4.00 per day for boat and man) appears to me to be rather high; the late war has been made an excuse for a multitude of sins in this respect, not only at Newboro' but elsewhere.

Before concluding this article, I should like to say a few words with regard to a matter which was brought before my notice at Delta. Early in July last an article appeared (over

the pseudonym of "Keokuk") in the "New York Sun"; making serious assertions with regard to the condition of affairs in the Lower Beverley Lake. Amongst other things it was alleged that the water in this lake had become so contaminated that the bass were dying wholesale; and that those which were caught were almost invariably found to be suffering from foul, open, wounds; also that there was a large discharge of sewage into the lake for which this state of affairs was accountable. Speaking as a fisherman of over forty year's experience, and after a very exhaustive examination of the alleged facts, I found nothing to complain of in the condition of affairs in the Beverley Lakes. During my stay at Delta I had the opportunity of examining a large number of large and small-mouth black-bass which I killed myself, as well as a quantity of those killed by other anglers; but amongst the whole number I did not find a single foul or diseased specimen! From what I can gather, the writer of this article was formerly a regular visitor at Delta; but, during his last visit, chose to take offense over certain matters entirely unconnected with angling, and vented his spleen by means of the article I refer to.

My readers will doubtless recollect that I have a more or less laudable habit of providing detailed information with regard to my wanderings. I have already dealt with accommodation, etc., at Newboro'; whilst at Delta I can personally recommend

Marble Rock Island, Delta Lake, Ont.

Mrs. T. H. Watson's boarding-house as clean and comfortable; and Mrs. Watson herself as most anxious to do all she can to make things pleasant for her guests. There are two guides at Delta; James Saxton, who has a small motor boat for which he charges \$4.00 per day; and Alonzo Wilsey, who has good row boats, and whose services are available for \$3.00 per day. Both of these are good and reliable men; having employed them both I can speak from experience. Having a preference for what we used to call in my sea-faring days, "Wooden Sails," most of my time was spent with "Lon" Wilsey; and I never have met a more pleasant companion and obliging boatman in

my lengthy experience in such matters. Another good man to get in touch with at Delta is Mr. F. Birch, the local fishery inspector; a very pleasant fellow and most anxious to be of assistance to angling visitors. Mr. Cawley, the local station agent, was also very kind and obliging to me during my stay; especially when it came to getting a new rod from Toronto to replace the one I lost. As is generally the case when a thing is wanted in a hurry, the express people seem to delay it, and it was nearly a week before I got a substitute for the good old rod which now reposes in the depths of the Lower Beverley Lake.

F. V. WILLIAMS

THE boy stopped in the act of stripping a slender alder pole of its smaller branches just long enough to smile at the antics of a pair of red squirrels that were chasing each other about an old brush heap at the side of the brook. Presently he would be busy in that same brook, but these bushy tailed scolds of the woods were evidently trying to start something this morning and he had to take it all in.

The squirrels finally disappeared and the boy proceeded to finish up

that fishing pole. Directly in front of where he stood was swift-running shallow water and after attaching a piece of ordinary linen line to the end of his "natural growth" rod, he started down the bank toward a long stretch of still, deep water. On one side of the stream this "deep-hole" extended a foot or possibly a foot and a half back under the bank.

Dropping his hook, baited with a wriggling earth-worm on the upstream end of where the current had undermined the bank, he just let it

"drift." Now the boy was fishing "against the sun," that is, all the shadows cast by his movements were behind him and away from the clear, still water in under the bank. There was a dart outward of a mottled back and a vigorous tug at the end of that

homemade rod, and—the boy let that trout have his way with that worm-covered hook for perhaps two seconds and then he gave a "slat" to the pole. A speckled brook trout of some ten inches in length went sailing shoreward to land in the wild grasses and wet moss four feet or more from the water.

The boy quickly killed his catch by deftly sticking his thumb in its mouth and breaking its neck. It was then strung on a "cut from the brush, stringer."

Number one, this was, but before leaving this same pool he had two others. For perhaps a half mile he got no response to all his tricks of letting that homely tackle of his drift around sundry boulders, and sunken logs, then came into view a miniature waterfall and below this fall was a patch of foam that swirled and eddyed but always stayed just there below the fall. On this patch of foam were spots that looked as if one might have poked a goodly sized stick down through in a number of places and then the foam had closed up the hole again.—Ever see spots like that on a foam patch on the trout streams you follow?

The bait was dropped at one side of this foam and the current swept the line into it and there was a "yank" on that line and the boy landed another nice trout and four others beside, five trout out of that one hole. Yes, indeed, trout sure do love the shady places.

And then—there was that bunch of big boulders, now the last time the boy had passed this way, he had hooked, but lost a fine trout right here. This time he approached the place as quietly as the summer breeze, dropped in his bait, and as it went past the first boulder, it was seized and carried underneath. For perhaps two seconds the boy thought he had a monster trout, but the supposed trout soon proved to be an eel, and this eel had a corkscrew hold among the rocks with his snake-like body, and how he held on!

The boy, not wishing to put too much "pull" on his line, merely kept it

Did this ever happen to you ?

taut, and gave a few inches at a time—as the eel got tired holding his grip on the rocks,—he loosened up and was finally landed on the bank, a wriggling, slimy, snaky mess, and after much trouble the fisherman cut the line above where the eel had befouled it with his slime, and putting on a new hook—the eel had gotten the other hook so far down his neck it would have taken a surgical operation to recover it and the boy did *not* like eels. What trout fisherman does? Needless to say that eel did not go back into that trout stream.

And then, the last place he was to try at, before hitting the road home, an old log, a big log, one that the boy could just nicely walk out on. He did not expect to get much, if anything, an odd fingerling that would have to be put back, but to his surprise, he landed after a struggle—the largest trout of the day—thirteen inches long he was by actual measurement. Some trout, the boy thought, at any rate.

And, then there was another boy, same age, same good health to start with, all except environment were equal, but this other boy was supposed to have *advantages*, he lived in the *city*. The same day the boy in the country went fishing and got *real game* fish, our city boy went down to the public beach for a swim. It seemed about the only place to go. It was hot, the parks were jammed—crammed full of people trying to keep cool. Tired mothers with their babies, young people with lunch baskets, crowding each other out of the shady spots.

Tom, Dick and Harry almost too “spiflicated” with the heat to try to flirt with the girls that were there for no other purpose. The beach was almost as bad as the parks, sweltering hot, perspiring humanity everywhere.

The city lad had had his swim. Yes, he swam till he was all in, he ate a few “hot dogs” from the sandwich wagon on the corner—as it was too far to go to a restaurant in a bathing suit—drank a couple of bottles of pop to quench his thirst while sitting in the shade of the pier, the life-saver

of the beach spooning with one of the beach beauties as a background.

You know it’s a good deal a question of environment and pocketbook, but which boy would *you* rather have been?

“He wondered how the Life Guard could find so much to talk about.”

On Lake Timagami, Highlands of Ontario

The Summer Call to the Northland

WALTER THORNTON

WITH the approach of the languid summer days the travel thoughts of tens of thousands of city folk turn towards the Canadian summer resorts. To dream in a southern or mid-western city on an August noon of the cool breezes which blow over the "Highlands of Ontario"—name of magic appeal to lovers of the cool uplands—is to feel the urge of northward flight with the same strength that it carries to the birds in the spring. An increasingly large number of United States residents are responding to the call of the North each year. Transportation companies and hotel systems have combined to make a visit to Canada as attractive as possible.

The Highlands of Ontario in particular have been made known to vacation seekers in every State of the Union. The businessman and his wife now leave the American cities and within a space of a single day's travel are encamped on the shores of some northern lake, or installed in comfortable quarters in hotel or cottage. The Government of Canada, realizing the asset it possesses in its wonderful scenic regions, has set aside vast territories of incomparable beauty to remain forever as part of the public domain.

The Ontario Provincial Government led the way in this regard when it declared a lake-land territory of four thousand square miles, just north of Toronto and west of Ottawa, a playground for the people and a sanctuary for wild life for all time. This region is now known as Algonquin Park. The reserve approaches the ideal of what such a playground should be. The fifteen hundred lakes and streams within its boundaries are well stocked with sporty bass and trout. The altitude, something like 2,000 feet above sea level gives this section of Ontario a splendid mid-summer climate. When you step from the train at one of the little stations in the park you feel

at once the tonic properties in the air, with its odor of pine and spruce. Minx scurry busily about on rock ledges, while little red squirrels flit warily from tree to tree and are so tame that they will come to your camp and pry off the lid of your biscuit tin. There are birds of almost every species from the ocean seagull to the timid robin, the loon and the hermit thrush.

The entire area is in a natural unspoiled condition, and one may paddle over the lakes and through their connecting streams for days without finding signs of man's occupancy. Men and women reasonably fond of woods and waters find a summer in the park an ideal vacation. Women who would not dream of such a thing a few years ago are now taking to the woods with an enthusiasm which they never experienced toward any other form of holiday outing; and find, too, in the simple, care-free life a delightful relief from domestic exactions and social calls. No great vacation territory could long escape the customary provision for the hosts of folks who do not care for camp life, but who do most enthusiastically love wild Nature. There are now five hotels in the Park.

Another beautiful region is the Lake of Bays District. Here also the altitude, 1,000 feet above the sea, makes the spiced air rare and invigorating. The Lake of Bays is the gem of a chain of lakes, some of them linked, one to another, by locked rivers, and some by open free-flowing streams. Upon these lakes are natty little steamboats giving service to the various points. These lakes offer safe and enjoyable facilities for boating, bathing, golfing and fishing, being sheltered from heavy winds by the numerous island and landlocked bays.

The Muskoka Lakes are probably the most famous of Canadian resort districts, comprising three lovely

An afternoon catch of maskinonge near Rose Point Summer Resort, Georgian Bay, Highlands of Ontario.

A party of sportsmen making their way to new fishing grounds in Algonquin Park, by way of one of the many streams which link the lakes together

lakes, Muskoka, Rosseau and Joseph. When you enter the Muskoka district you are amazed at the extent of the lakes, which appear so small on the map. Then the multitude of islands and the diversified shore line cause the visitor to wonder how the captains of the lake steamships pilot their vessels so swiftly and safely through the maze. This is also a paradise for any man or woman fond of a canoe or a launch, and everywhere in these lakes there is good fishing and bathing in safe waters, and fine opportunities for a game of golf or tennis.

The Timagami region is another of the great Canadian reserves that have been set aside for all time as

playgrounds for the people. It contains 3,750,000 acres of lakes, rivers and wooded lands. In the centre of this territory is wonderful Lake Timagami, with its shore line of 1,132 miles, while there are hundreds of other lakes to invite the angler and canoeist. The disciples of Isaac Walton make a Mecca of this northern lakeland for in Timagami, and the innumerable surrounding lakelets, are game fish without end. Many of its pools have never given back the reflection of a white man's face. With the 30,000 Islands region of the Georgian Bay, and Algonquin Park Timagami shares the reputation of being the best fishing ground in Canada.

Rabbits As Food

Wild rabbits in the United States have always been an important item of food, especially during the cold part of the year, and hence less attention has been paid to the breeding of rabbits than in most foreign countries. It would be impossible to estimate correctly the number of rabbits marketed and eaten in Great Britain. Not only are the home warrens and farms drawn upon for a supply, but from 10,000 to 12,000 tons are, in normal times, imported annually, coming partly from the Continent, but in great numbers from Australia and New Zealand.

In France, Holland, and Belgium rabbits are a common article of diet and rabbit breeding is general on farms, especially where the land holdings are small. Spain produces many domestic rabbits and is sometimes regarded as the original home of the common European rabbit, which science is pleased to call *lepus cuniculus*, since Strabo, writing about the beginning of the Christian Era, stated that ship cargoes of rabbits were brought to the Roman markets from that country. Whether or not the European rabbit

is superior as an article of food to the wild cottontail rabbit of our forests and fields is a matter of individual taste.

The so-called Belgian hare is merely a domesticated form of the wild rabbit of Europe, long bred with special reference to the development of a superior food animal. Its flesh is generally considered better than that of the ordinary hutch rabbit.

While not affording large profits, the business of raising rabbits is a small way may be made an interesting as well as a reasonably remunerative adjunct to other pursuits. Especially is it adapted to small towns as well as to farms, and under careful management the returns from this pursuit are likely to increase as one gains experience. Under favorable circumstances, such as being within easy reach of a large market, it is capable of expansion into a serious vocation. The presence of rabbits in inclosures on the farm or on village premises furnishes opportunity for an agreeable change in the family diet, a fact that is of considerable importance when ordinary meats are so high-priced, as at the present time, or in regions where they are difficult to obtain.—T. H. H.

Muskoka Lakes, Highlands of Ontario

Three Hundred and Twenty Six Years After the Birth of Izaak Walton, (August Ninth, 1593), we Pause in the Round of Things to Pay our Respects to the Father of Angling; now an Institution.

ROBERT PAGE LINCOLN

TO the world outside the sphere of angling the name of Walton may just be a catch-word. But to those who have found delight and endless pleasure in the out-of-doors, and in angling in the good waters, to those I say the name of Walton is at once more than a name among the thousands; it is a name that stands for all that is worth while in this world. The contemplation of fresh and inspiring rural sights; the joy of casting a delicate fly along a stream's course in the month of June; the beautiful coming of dusk; and the homeward trip over the road to the home—all these things stand for Walton. It was not alone the catching of the fish that held his heart. Fishing was to him the key that opened the door of a wider outlook upon the world. It may not be that he saw less when not sitting at a stream side; but there can be no doubt that he enjoyed a loftier viewpoint when engaged in the gentle sport of dropping a line and waiting for the nimble

ones to take the hook and dart away with it. As he pushed aside the branches that overhung the stream and viewed a clear expanse of water he knew that he was looking upon the very life-blood of purity and cleanliness, and that to be pure and clean one must visit the running streams and drink of them not only with the lips, but also with the mind. To sit upon a bank and view the waters moving by on their way to the sea; the ripple and curl; the freshness coming up from the lush edges, all these things are in tune with the infinite. They spell composure that is composure, peace that is peace, silence that is silence, beauty that is beauty in that great degree that puts all the efforts of man, with his artificial embellishments, to shame. We are forced to go to Nature for our examples of contentment. If the quietude of Nature does no other one thing, it at least tells us to act calmly, with deliberation, to rest when we need to rest and work when we feel like working,

Walton's Prayer

I crave, dear Lord
No boundless hoard
Of gold and gear,
Nor jewels fine,
Nor land nor kine,
Nor treasure-heaps of anything.—
Let but a little hut be mine
Where at the hearthstone I may hear
The cricket sing.
And have the shine
Of one glad woman's eyes to make,
For my poor sake,
Our simple home a place divine;—
Just the wee cot—the cricket's chirr—
Love, and the smiling face of her.

I pray not that
Men tremble at
My power of place
And lordly sway,—
I only pray for simple grace
To look my neighbor in the face
Full honestly from day to day—
Yield me his horny palm to hold,
And I'll not pray
For gold;—
The tanned face, garlanded with mirth,
It hath the kingliest smile on earth;
The swart brow diamonded with sweat,
Hath never need of coronet.
And so I reach,
Dear Lord to Thee,
And do beseech
Thou givest me
The wee cot, and the cricket's chirr,
Love, and the glad sweet face of her!"

—James Whitcomb Riley.

H. Williams

Peace is a summer sky through which the clouds soundlessly pass; the red clover nodding in the fields, with the bees humming amongst them. Peace is the bridge that spans the brook and which we pause upon in the still summer noon-day to think of the hours of our boyhood. Peace is the feel of the brook water as it laves our bared body, where, naturally, and unashamed we stand in our nudity and feel the brazen conventions of inrooted civilization fall away from us, as, too, our worries flee into the great beyond of dungeoned horrors. To tear oneself away from the very haunts of man; to penetrate deep into natural nooks where no glaring eyes hunt one out and there to lie down beside some fresh water and muse on freedom—that, I fully believe, was what Walton lived to tell; and is that which we know him by. The gladness that is the summer sunshine on endless acres stretching to a crimson west; the swaying trees that scatter notes of incomparable music into the air; the rolling hillocks that show full-blown flowers on their crests; the sight of a mother bird feeding her young in the nest, and the father bird sitting on the tip-most branch singing his paeans unto the Highest—these are things that attune our emotions, bringing kindliness and healthful retrospection—and of these things Walton wrote; for he knew that they were the worth-while things that enliven our short hour of existence ere we pass on into the earth from whence we came. If we have missed these natural sights, and sounds; if we have sunken our all in the Great Grist Mill of Life then we have not lived, but must soon die and be made over anew of kindlier, happier mold.

It is quite a mistake to believe that the literature of angling is the root of its fascination; although it must be admitted that the writings on fish and fishing make up a great deal of that which we hold near and dear. To be without a literature of angling would be a severe loss—just how great a loss I am not given to know, nor is anyone given to know until that literature has been denied him. Mainly the literature of angling tells anew every year the principal delights of the immortal pastime, and these delights never cease to have their attraction since angling is the very heart of pleasure; the prime restorative; the kindly glimpse into an earthy heaven that is open to all, denied to none. Angling literature impresses upon the minds of nature-lovers the fact that angling is worth while. Just so Walton's *Complete Angler* reaches the heart and has proven from

the start that angling is not a question of butchery, but a question of taking wisely from the storehouse of nature; that angling is the key to a greater world that is man's for the entering.

"If I did not have angling literature to read," says my friend, "I would lose much of my interest in the game. The literature of angling keeps my blood pumping with enthusiasm, and makes every trip I take to the brooks and lakes of never-dying interest."

We can well agree with that old sportsmen's poet, Isaac McLellan, that, "All anglers of this distant land, love their dear Walton's famous name," and this love remains the same in our day as in the day of the old poet; and it will remain so, we are given to believe, through all time. Walton is the very symbol, one might say, of angling. We speak of Walton and the pastime of angling in the same breath; one is equivalent to the other. Men accumulate a transitory fame in this world during the first half-hour of their lives; it is a fame that stands the test of a few years in comparison with the deposit of the ages, and then they pass on into the beyond of oblivion. But as for Walton, his name remains the same. Revolutions sweep the world; newer methods of thought and action are inaugurated; old systems and the machinery of slavery go down to the dust under the hammer of truth and righteousness—but fixed and certain through all changes, angling remains angling, and no matter how dark the age, and no matter how dark the decades still there are men living a life that is adjusted to the spiritual excellence of angling, and its particular mission in this grossly humdrum world.

Walton lived in a strange old day; and it is indeed a marvel that he could set to paper any thoughts whatsoever about the joys one may find in this world. Nevertheless such was the case. In Nature and the running streams he found solace and contentment. It was a dark day of religious intolerance, "for in those days even suspicion of toleration for heresy was liable to cost a man his estate, if not his head." When old London became unbearable with its miscellaneous howlings, suspicions and murders in the dark, he thought of kindlier scenes, and hence took him away to the quietudes of Stafford, there to live the rest of his days in peace. It is said that Walton was a linen merchant and that he was quite well to do. It is a fact at least that he held important leases and drew rents.

Whatever wealth or means that Walton had he states he had "neither got by falsehood or flattery or the extreme cruelty of the law of this nation" which very properly brands the conditions of the times he lived in and which he would be rid of, much as we desire to be rid of the equally as lamentable conditions of our day, which are, I may say, counterparts of darker ages than the Dark Ages, and which will so live in the future recorded history of man, I have not the least doubt.

Walton's famous will is full of kindness and a remembrance of those about him. He would set some rent money aside for the bringing up of two boys "the sonnes of honest and poor parents" so that they would "be better afterward to make their owne liveing." He is not forgetful of the poor people and his quaint directions to buying coal for these people is not without its practical observation. The "said Coales" were to be delivered "the first weeke in January, or in every first weeke in February; I say then because I take it that time to be the hardest and most pinching times with poore people."

Says William E. Simmons:

"Readers of Walton's Complete Angler will not need to be reminded of the kindly human spirit prevading its pages, but in the text of his will are to be found more definite evidence of the broad philanthropy and all-embracing charity of the man; that genial philosophy and benevolent disposition of the Patron Saint of Anglers."

Walton's will stands as follows:

"In the name of God, Amen: I Izaak Walton, the elder, of Winchester, being the present day in the ninetyeth yeare of my age and in perfect memory, for which prayed God be, but considering how suddainly I may be deprived of both, doe therefore make this my last will and testament as followeth; and first, I doe declare my beliefe to be that their is only one God who hath made the whole world and me and all mankind, to whome I shall give an account of all my actions which are not to be justified but I hope pardoned for all themerrets of my Saviour Jesus, and because the profession of Christianity does at this time seeme to be subdivided into papist and protestant I take it at least to be convenient to declare my beliefe to be in all points of ffaith as the Church of England now professeth and this I doe, the rather because of a very long and a very true friendship with some of the Roman Church, and for my worldly estate (which I have neither got by

falsehood or flattery or the extreme Cruelty of the law of this nation) I doe hereby give and bequeath it as follows: first I give my sonne in law Doct. Hawkins and to his wife to them I give all my title and right of or in a part of a house and shop in Pater noster rowe in London which I hold by lease from the Lord Bishop of London for about fifty yeare to come, and I doe also give to them all my rights and title of or to a house in Chancery Lane, London wherein Mr. Greinwood now dwelleth, in which is now about sixteene yeares to come, I give these two leases to them they saving my Executor from all damage concerning the same; and I give to my sonne Izaak all my right and title to a lease of Norrington Farm which I hold from the Lord Bishop of Winton, and I doe also give him all my right and title to a Farme or land neare to Stafford which I bought of Mr. Walter Noell; I say I give it to him and his heires forever but upon the condition following namely; if my sonne shall not marry before he shall be of the age of forty and one yeare, or being married shall dye before the said age and leave noe sonne to inherit the said Farme or Land, or if his sonne or sonns shall not live to obtaine the age of twenty and one yeares, to dispose otherwayes of it then I give the said Farme or land to the Towne or Corporation of Stafford (in which I was borne) for the good and benefit of some of the said towne as I shall direct and as followeth, but first note that it is at this present time rented for twenty one pounds tenn shillings a yeare (and is like to hold the said rent if care be taken to keepe the barne and houseing in repaire) and I wood have and doe give ten pound of the said rent to bind out yearly two boyes, the sonns of honest and poore parents, to be apprentizes to some Tradesmen or handycraft men to the intent the said boyes may be better afterward to get their owne liveing; and I do also give five pound yearly out of the said rent to be given to some maide Servant that hath attained the age of twenty and one yeare (not lesse) and dwelt long in one service, or to some honest poore man's daughter that hath attained to that age, to be paid her at or on the day of her marriage and this being done my will is that what rent shall remaine of the said Farme or land shall be disposed of as Followeth: first I doe give twenty shilling yearly to be spent by the Mayor of Stafford and those that shall collect the said rent and dispose of it as I have and shall hereafter direct, and that what mony or rent shall remaine undisposed off shall be.

employed to buy Coales for some poore people that shall most need them in the said towne, the said Coales to be delivered the first weeke in January or in every first weeke in February; I say then because I take that time to be the hardest and most pinching times with poore people and God reward those that shall doe this without partialitie and with honestie and a good conscience; and if the said Mayor and others of the said towne of Stafford shall prove so negligent or dishonest as not to imploy the rent by mee given as intended and exprest in this my will (which God forbid) then I give the said rents and profitts of the said Farme or land to Towne and cheiefe magastraits or governōrs of Eccles-hall to be disposed of by them in such manner as I have ordered the disposall of it by the towne of Stafford, the said Farme, or land being near the Towne of Eccles-hall; and I give to my sonne in Law Doctor Hawkins (whome I love as my owne sonne) and to my daughter, his wife, and my sonne Izaak to each of them a ring with these words or motto—"love my memory I. W. obiet;" to the Lord Bishop of Winton a ring with this motto "a mitt for a million, I. W. obiet;" and to the friends hereafter named I give to each of them a ring with this motto "A friend's farewell, I. W. obiet;" and my will is the said rings be delivered within forty dayes after my death, and that the price or value of the said rings shall be thirteen shillings and four pence a piece. I give to Doctor Hawkins, Doctor Donn's sermons, which I have heard preacht and read with much content; to my son Izaak, Doctor Sibbs, his Soules conflict, and to my daughter, his bruised reed, desiring them to read them for as to be well acquainted with them; and I also give unto her all my bookes at Winchester and Droxford and whatever in those two places are or I can call mine except a Trunck of Linnen which I give to my sonne Izaak; but if he doe not live to Marry or make use of it then I give the same to my Granddaughter, Anne Hawkins, and I give to my daughter Doctor Hall's works which be now at Farnham; to my sonn Izaak I give all my bookes (not yet given) at Farnham Castell and a deske of prints and pictures, alsoe a Cabinet near my bedshead in which are some little things that he will value, tho of noe great worth, and my will and desire is that he will be kind to his Aunt Beachame and his Aunt Rose Ken by allowing the first about fifty shillings a yeare in or for Bacon and Cheese (not more) and paying four pound a yeare toward the boarding of her sonnes dyet to Mr. John Whitehead; for his Aunt

Ken I desire him to be kind to her according to her necessity and his own abilitie and I commend one of her children to breed up (as I have said I intend to do) if he shall be able to doe it, as I know he will, for they be good folke. I give—to Mr. John Darbyshire the Sermons of Mr. Anthony Farrington or of Dr. Sunderson which my Executor thinks fit; to my servant, Thomas Edghill, I give five pound in money and all my Clothes, linen and wollen (except one sute of Clothes which I give to Mr. Holinshed and forty shillings) if the said Thomas be my servant at my death, if not my Clothes only; and I give to my old friend Mr. Richard Marriott, tenn pound in mony to be paid to him within three Months after my death, and I desire my sonne to shew kindness to him if he shall neede and my sonne can spare it; and I doe hereby will and declare my sonn Izaak to be my sole Executor of this my last will and testament and doctor Hawkins to see that he performs it, which I doubt not but he will. I desire my burial may be neare the place of my death and free from any ostentation or charge but privately; this I make to be my last will (to which I shall only add the Codicell for rings) this sixteenth day of August, One Thousand Six hundred eighty three. Izaak Walton. Witnesse to this will.

The Rings I give are as on the other side.

To my brother John Ken; to my sister, his wife; to my brother Doctor Ken; to my Sister Pye; to Mr. Francis Morley; to Mr. George Vernon; to his wife; to his three daughters; to Mistris Nelson; to Mr. Richard Walton; to Mr. Palmer; to Mr. Taylor; to Mr. Tho. Garrard; to the Lord Bp. of Sarum; to Mr. Rede, his servant; to my cozen Dorothy Kenrick; to my cozen Lewin; to Mr. Walter Higgs; to Mr. Charles Cotton; to Mr. Richard Marriot 22; to my brother Beacham; to my Sister, his wife; to the Lady Anne How; to Mrs. King, Doctor Philips wife; to Mr. Valentine Harecourt; to Mrs. Eliza Johnson; to Mrs. Mary Rogers; to Mrs. Eliza Milward; to Mrs. Dorothy Wallop; to Mr. Will Milward of Christ Church, Oxford; to Mr. John Darbeshire; to Mrs. Unedville; to Mrs. Rock; to Mr. Peter White; to Mr. John Lloyde; to my cozen Greinsell's widdow, Mrs. Dalbin, must not be forgotten 16; Izaak Walton note that several lines are blotted out of this will for they are twice repeated and that this will is now Signed and Sealed this twenty and fourth day of October One Thousand Six hundred and eighty three, in the presence of us Witnesse Abra. Markland, Jos. Taylor, Thomas Crawley."

FISHIN' ALONE

ROBERT PAGE LINCOLN

THE charms in fishing alone, whether it be upon the stream or upon the lake, are many. Just how many anglers there are given over to fishing, "by their lonesome," as one would say, I do not know. There are a great number of the angling brotherhood who would rather not go fishing at all than to fish without a human companion. There is always the feeling in one that he would like to share his successes or his failures of the very moment with a companion, and talk over with him the remedy or the successfulness of the hour or the day. This is all as it should be. No doubt most of our red letter days are days when we have been in the company of some boon companion, and, therefore, what one has felt, both have felt and gained pleasure by. Nevertheless there is that about fishing alone that has an indescribable something to it of charm that will not down. What it is I do not know. One does not necessarily need to be a crank to go about his piscatorial adventures without human companionship. And, furthermore, one is never without companionship with the gentle wonders of Nature laid out before his eyes at all times of the day; at all hours. But fishing alone—by so doing I have no doubt but that we give ourselves over more fully to a study of the science of fishing, whereas, with a companion we are liable to keep that person's figure in the mind, con-

scious of his presence, and not fully aware of the study of the stream and the action of the fish in the stream, that is necessary to success. By success I do not mean the filling of a large creel; but success in catching a wary fish, that has long avoided capture; on some lure especially wrought for his destruction.

It is sad to relate, yet very true, that the average man of the rod is not content unless he has fished the whole length, or near to the whole length of a river, or stream, in a day. The hours are all too short in his eye. At dusk he finds that he has covered ten miles of stream and yet has twenty miles to go before he has reached its source. He finds a pool casts a couple times, and then works up in his fancy an elaborate picture of a pool further up that must contain trout so eager to take the feathered artifice that it is just as well that one is at a distance from the hungry finny one. Even if a reasonably sized fish be taken, yet this fisherman will mentally assure himself that it is a small one and that there are better ones to be had further up.

I was fishing the Brule one summer. Day after day I went out to the river, and found so much pleasure in fishing a half mile of the stream, and had such good success that I felt no desire to go further, until I forced myself to do so. Every day I went down to that half mile of stream I found some new condition of stream formation, and lay-out

of the bottom that I had not previously noted. At the close of a week I knew and still know that half mile of stream like a book. I can draw off-hand a sketch showing the placement of every likely boulder, every log-obstruction, every pool. In short I found out just where the big fellows lay, and fished accordingly. All this is possible when one fishes alone and can deviously, painstakingly, study the stream and go about his movements by gradual, imperceptible degrees and thus place a cast with a nicety at the right spot when he feels like it.

I have always held that one cast rightly placed, and with care, is worth ten casts made haphazard. Furthermore the one cast may make the capture; the ten casts may acquire nothing; in fact they may frighten the fish into seclusion. With a companion with you on a stream it is the usual thing that two keep near to each other. Even two, I hold, in such a condition is over-crowding. One man going up a river is all that should obtain at any one time. If two fish a stream, even if it be a wide one, one angler should go up first, the other one following some distance behind. But to do this both men must be of an equitable disposition, else the man in back may believe the man in front is getting the best fishing. Fishing alone you are rid of all such reflections and can give your

mind over fully and freely to the particular study you wish to follow up. Or if you do not feel like fishing you seat yourself on a boulder and make a quiet study of the stream, watching for rises, and the movements of fish. In such intervals you, like as not, will make note of some particular insect just arrived into the atmosphere on which the fish are taking. You may make a selection from your fly-book, within a shade of imitation of the winged one, and catch a fish without stirring from your boulder.

The attractiveness of fishing, alone, is apt to grow upon one, and he is liable to choose to fish alone much in his after days, especially if he is given to a study of the habits of fishes, and continually has some especial flies that he wishes to try out. Seclusion, is, then, to him a blessing. I believe that the fullest understanding of the art of angling comes through this apartness; tho' I will admit that one grows less talkative, and in time, bottled up with his own findings, and jealous of what he has found out; and which others seek to pry from him.

But, assuredly, the fullest meaning of the word "angling" is borne out to the man who fishes alone. There remains in one no desire to exceed his fellow in skill; no desire to acquire a greater catch; in a word, the spirit of competition is done away with.

And, Too, We Have Still Fishing With Us.

ROBERT PAGE LINCOLN

STILL-FISHERS come in two classes, namely the still-fisher possessed of the belief that it is in him to catch every fish that a lake may hold, all the way from one inch in length to ten feet, and if he could do

this he would avariciously take them all home, consume two or three of them and dig the rest down in the good old Mother Earth. The next class of still-fishers takes in the dreamer. The dreamer still-fisher is molded truly, of the clay of Walton. He comes as close to being the shade of Walton as any shade could be, and although I know that the great scientific host of anglers are willing to argue this at length, nevertheless, I feel that

I have struck upon the correct comparison. It is said by some that to be a good still-fisher it is not necessary to know a great deal about fish, or fishing, so far as that goes. Walton did not know one fish from another it is said, but then this does not matter. If a man knows a bull-head from a sunfish he will be crowned with success. If he does not he will have to find out by sitting first on the one fish and then on the other. This has proven an unfailing means of telling the differential—I mean the difference—between one fish and the other.

When a man decides that he will like ever thereafter to be a contemplative still-fisher he is first forced to lay aside his pleasant worries, grouches, bitterness and sour stomach. Each of these ailments are cured as one ascends in still-fishing. While he hates to see his worries go, still he feels it must be done. Mentally he says: "Yes, I'll do it. The time has come. I'll become a still-fisher."

The first thing that an aspiring still-fisher needs is a pole. There are two kinds. (1) the long pole, and, (2) the short pole. The only difference is that one is long and the other one is short. When you see a contemplative still-fisher wending his way to the lake with a pole so long that it gets jammed in in the bend of the road, have patience with the person carrying it. Remember his heart is in the right place. The thrill is there.

If one has some time at his command he can make his own pole out of any self-respecting basswood tree. In fact a basswood is *par excellence*. With it you can catch both pickerel and sardines with agility. It is not necessary to silk-wind your basswood pole. It has a delightful, though unconscious "give" to it and when it dries a little it will "set" to any curve that is desired. A few fancy knots on it only enhances its value.

And now we come to the boat. I doubt if a man ever was a successful still-fisher who ever went still-fishing in a brand new boat. There is something obnoxious about a new boat especially when its painted and smelly and all that. You know the kind I mean. You can get down and mirror yourself on the side of the craft and shave if you want to. Now a boat like that ain't treating a still-fisher square. Yuh simply can't fish in a new boat. O I know, some try it, but as I say they are not successful.

No man ever was a successful still-fisher who did not go still-fishing in a boat that leaked. If the boat is old and it leaks there is hope. But the successful boat for the

successful still-fisher must not leak to such an extent that one is forced to bail water all the time because this causes too much use of the mental capacities, besides what physical strain is thrown in for good or bad measure. It should leak just enough so that every fifteen minutes one says to himself:

"Whew! ain't that water comin' in though. I'll have to get after it or I'll sink."

The successful bailing appliance, or can, for bailing out water from a still-fisher's boat is a very simple utensil. It formerly was the home of tomatoes, like as not, or Sunny Valley Peas. This can should never be new. There is not a still-fisher still-fishing in this world who has not a marked aversion for a new can. As a rule this can has been opened by a newly married woman who did the awful deed with a monkey wrench and a section of a sword that has been beaten into a plow share. She did it cross-ways, each quarter section being turned up and the peas or tomatoes rolled or forked out as the case may be. Thus when the still-fisher wants to use this pea or tomato can for bailing purposes he takes hold of one of the quarters and dipping it half-heartedly into the water he gets a spoonful inside of the can each time and throws it overboard with alacrity. With a can of this sort in his possession a man soon bails out a quart of water with comparative ease; furthermore the can has other uses. No still-fisher ever carries a knife with him, so he uses the sharp edges of the can on which to saw off his line when he wishes to change from a sunfish hook to a pickerel hook.

One of the most delightful and primitive things to be seen on board the boat of a still-fisher is the still-fishing anchor. An abandoned cow-rope not only makes an ingenious anchor rope but one that will break at the moment you least expect it to. To be successful at still-fishing the anchor rope must break now and then so that you will drift half way cross the lake before you know where you are. But if the rope should be strong, and will hold you firmly in place once you are anchored, do not despair. The anchor usually works loose and you are given the opportunity of drifting across the lake without your knowing what has transpired. The anchor is usually composed entirely of a rock wound around with a rebellious hay-wire. Not being wound according to Hoyle it works loose with telling effect. The true still-fisher has nothing in common with the modern still-fishers who use anchors made out

of concrete poured into a large can, same having an iron ring in it. The trouble with an anchor like that is that it is too efficient. It approaches perfection, therefore leaves nothing to be asked for.

If the still-fisher's boat leaks, if the anchor rope is pleasingly dilapidated, and if the oar-locks are not what they should be then you are on the way to joy. Now then for the fishing. Statistics prove that two thirds of the still-fishers of the country anchor in from four to five feet of water, thirty to sixty feet from shore. You course through the clinging mosses and pads and like as not you are marooned in the center of them and so you are forced to stand up and paddle out. You soon get outside of the weeds. All right; you pull in the oars, you sit a while viewing the immediate surroundings, then you get up and you throw the anchor out of the boat with a whang. It goes to the bottom; bubbles come up; then a cloud of mud. All this done in such a devilishly reckless manner, too. The cautious fisherman would scold you for throwing your anchor over in such a manner, with the double-distilled wisdom kindly given you that it scares all the fish out of the lake. But the still-fisher knows better. There isn't a fish that does not want to come over and see who fell in and got drowned.

Having dropped in the anchor according to Section 5, Clause 2, the still-fisher returns to the middle seat, cautiously moving along bent over, testing his way for fear of falling in and so injuring the water. If he is the fortunate owner of a corn-cob pipe he lights that and then is ready for work. The pole is set upright in the boat, being careful, however, not to get it caught between the clouds. The pole is held in this position while the hook is completely surrounded by a worm threaded on in spite of its feeble protestations. When it is perfectly lifeless appearing on the hook it is ready to be cast out. If any sign of life appears the still-fisher does not despair but continues menacing it by working it back and forth on the hook. After a little of this process the angler-worm gives up its ghost and is ready for work. But before it is cast to the eager finny ones it is customary to spit on it. It is ridiculous, yet nevertheless true that one has little luck at still-fishing unless he spits on his hook.

Imagine a still-fisher fishing with a bobber on his line purchased in a sporting goods store

for the sum of ten cents, painted red and green. No! Away with such fancies. It must be the usual whiskey bottle cork or vinegar jar cork or it won't be still-fishing. You throw your pole back and then forward; the bobber hits the water; the hook sinks and then you begin to ruminate. For an hour the perch are baring the hook for you and then all you have to do is to pull up every now and then and re-bait. A flock of bass may swim by in plain sight, but it does not encourage the still-fisher to up and fling his hook and bobber "far and fine" at them, knowing full well, through experience, that it is of no use. But sometime, the still-fisher figures, "sometime I'll get a mess of them big fellows." *Especial Note:* There is the incentive; don't you see?

Anything may happen while you are still-fishing.

Wide and glorious vistas open to the view.

It may be while you are sitting there a large pickerel will mistake your anglerworm for an artificial minnow and will swim up and down in front and around it kind of treating it in a flirting way that the pickerel have about them. Then he will back up about ten and a half feet, get a foothold and will leap for the anglerworm. You have, just before this singular event been thinking about something but could not make up your mind what that something would be. A still-fisher is always in peril of thinking too seriously on some interesting subject. When the pickerel hits your anglerworm what follows after that becomes progressive history. You may lose your fish but if you do you are not wholly sad, a bright thought illuminating your mental capacities that if you had only caught that fish and if you had two more that would make three fish to your credit. I doubt whether any active still-fisher would even like to catch a large fish. Most generally you catch a small fish and he comes in making an awful commotion for his size. You gently pick him off the hook and toss him in and you are not overly surprised to catch him again three minutes after. After you have again thrown him in and you catch him once more, while you are not ready to quit you disgustedly cast over on the other side of the boat and are startled to hook a weed a moment thereafter which "pulled just like a fish." All these little things go to make still-fishing so beautifully simple; so enriching to the prospect.

Chips From the Workshop

ROBERT PAGE LINCOLN

IN writing on the depleting of lakes and streams, and of those who cause this condition a writer in the American Angler has stated:

"Some time ago, 'Royal Coachman,' a popular angling writer in a daily paper, placed the blame on the summer boarder for the fished-out condition of lakes and streams. It is not my intention to belittle their share of responsibility since I, also, have seen them bringing in their catches ranging in all sizes down to the fingerling. But, there are others equally as culpable as these summer boarders. I refer to the natives who live in the vicinity of these lakes and streams, and who do great mischief, and generally do it secretly. In season and out of season they not only hunt game but extend their operations to the fish. They plant trap nets before the fishing season opens and also after it has closed, and not infrequently while the fishing season is on. In the middle of the night when their honest neighbors are in sound sleep they visit their illegally set contraptions and gather in the spoils. On occasions I have seen the wardens start out on dark nights with the intention of surprising these law breakers.

"The natives also do a lot of spearing, and there would be a surprise on the part of the law abiding anglers if they knew how large is the number of farmer boys and natives who own trap hoop nets and fish spears. It is supposed they spear eels, but the real truth is they spear other fish, particularly bass. Even in Ontario there are some who are considered as reputable citizens who privately confess that they spear bass while on the spawning beds and they always drive their spears into the largest ones. I have had men up there tell me they spear muscallonge, and I've been promised if I will come up in the early spring they will spear for me a thirty-five pound specimen. Needless to say I did not accept the invitation, nor could I report them to the authorities, since what they told

me of their misdeeds was imparted to me confidentially.

"Some of these persons I entertained a high regard for as sportsmen, and it came as an unpleasant shock to learn of their violations. One in particular I liked immensely, and found great pleasure in his companionship on fishing trips. With a rod and a line he appeared to be a real sportsman. Under-size bass he was tenderly careful in replacing in the water, and yet he could drive a spear into a large bass without reproaching himself."

There is a great deal of truth contained in the above quotation for it tells what goes on "underground," and which, to a very great extent indeed, is undermining our fish supply, and which, unless stopped, will make our efforts for protection and preservation of the finny creatures go for naught. The reference made by the above writer in regard to the depleting proclivities of the summer boarder, at the lake resorts, is true, to say the very least. It would seem to many that it is the small boy's game to go along the shores and fish out small fish, and fingerlings, and yet I have, in the past, seen whole shores cluttered with people fishing, catching thousands of the tiny fish life. Now a condition such as this is bound to work harm among the fishes: it cannot be helped. The only remedy is to educate the people into an understanding of what is right and what is wrong about the fishing game. I know of one State of the United States where the catching of thousands of small fishes was speedily done away with. It had been the case up to the time the new law was passed that any size of sunfish might be taken. The result was that the still fishers sapped gunny-sack after gunny-sack full of tiny mites of fishes from the water, lugging them home, where, if they had taken the few that they needed (and had been content with that) the thousands of useless small ones they had massacred would have gone to replenish the future supply. But

then, wisely enough, under agitation, the law was passed that no sun-fish might be taken under six inches. Some law offenders persisting in the old practices were brought to justice and fined five dollars for every under-sized sun-fish in their possession. The result was that the ruler became one of the most necessary appliances in the outfit of the fishermen—especially the still-fishermen—that season and I presume it is the same yet.

In no sense of the word should people be curbed from fishing; and it would be a pleasing thing indeed if all the people could have a share of what is annually taken, but, unfortunately, this cannot be, at least in the present day. But people who are able to visit the lakes and streams should be taught that it is absolutely necessary to the preservation of the fish supply that only a few fish be taken and those fish be of a suitable length. Now we have all of us, time and time again, seen large, catches made most of the fishes soured in the sun or lying in the sun, stiff and parched, later to be thrown away. Were these same fishes to have been gutted, salted, and laid away in damp leaves or mosses, they would, no doubt, have been useful as food. Were such occurrences of desecration as the above confined to but a few instances there would be no harm done; but the sum total of the destruction in this manner is exceedingly great. The only sane way of correcting this condition of affairs is to point out to the people the facts of the case. For unless watchfulness and the utmost of conservation be practiced in the future, all the efforts of man will go for naught and the fish supply will be constantly waning instead of increasing. There is no desire on the part of the writer to be an alarmist. Far from it. But the facts of the case must be viewed from every angle. With hunting becoming more or less a thing of the past, as the game is being thinned out, the great body of hunter will, sooner or later, turn their attention to another means to sport. Many of the hunting element it is true adopt trapshooting as a pastime. But the active, energetic man wants something more and therefore turns to fishing as the next best bet. Therefore we have the conditions to face: More and more people added to the ranks of those who fish, and more and more waters annually covered, cast over and trolled. Unless the utmost means of conservation are practised it will mean that the fish supply must go, in spite of what sincere men and fish culturists can do to improve conditions. When it is remembered that six million hunting licenses

were taken out in the United States in one year alone it will be seen that a great shifting of these into the ranks of the fishing brethren will do great harm, unless, of course, conservation is practised.

‘ We have always warned against the unscrupulous man who will fish in any season, and will take as many fish as he can lay hands on—and even then will not stop but will be looking for more. Farmer boys and settlers are able to do a great deal of harm, as has been pointed out, but I will not say that such a condition is general. It would be extremely slighting and disagreeable to believe that the men who are opening up the country and providing so much of the world’s food are the worst destroyers. On my own part I believe that the average settler and the average farmer boy is a very necessary person in this world and the majority of them have not the time to go spearing, let alone fishing. A great responsibility, indeed, lies with the settlers; the people out in the wild or near-wild places. We know that the majority of the settlers will do their part in protection. But many settlers, principally foreigners of dubious character, have, in the past, killed off enormous quantities of wild game; but that is not to say that all foreign settlers are capable of constant destruction. At that the destructiveness caused by certain Americans, and Canadians, in the game and fish fields is a tearful disgrace.

No true angler will be guilty of spearing any game fish, altho’ to spear rough fish is certainly not out of place, as the preponderance of these and the harmfulness of these rough species is such that a decreasing of them by means of the spear, or the net, will do a great deal of good no doubt. However, most laws, to the point, forbid the use of the spear on any form of fish; and perhaps this is the right way to consider the proposition. It is lamentable the number of people who will assail the trout in the large rivers when they go up spawning in the spring. Sometimes one wonders if the trout will last more than a few years the way spearing, netting and hooking these spawning fishes is carried on. It seems to me that every community should have at least some genuine anglers and sportsmen who will band together to keep down this menace of attacking the spawning fish, and yet it seems to go on the same as ever.

It has been said that the average person upon seeing a wild animal, a deer (for instance) cannot resist the impulse to kill it; an impulse

so strong that it sweeps them off their feet so to speak. The same certainly is true of fishermen, or even ordinary people who never fish. Seeing a large rainbow trout coming up the river in the spring to spawn, people cannot resist the impulse to kill; and the greater the fish in size, the greater the temptation, of course. Likewise in the lakes and ponds where the bass and crappies and sunfishes are on the spawning beds; people anchor over them and wipe out thousands of spawn-laden fishes. This slaughter during the spawning season I believe to be one of the hugest undermining factors in the decimation of our fishes today, and if this alone could be stopped, who can tell what gains are made. The spawning season of the brook trout is at present approaching. Thousands of magnificent *fontinalis* will be on the spawning beds. No doubt it will afford thousands of unscrupulous beings the incentive for going out and slaughtering them while they are fulfilling their duty in replenishing the waters. In the light of Nature this is a criminal act; all the more lamentable because the destruction is carried on in the dark, or far away from human beings. All we can do is to hope by education to create a spirit of conservation and preservation in the minds of the people so that they will, of their own free will, turn protectors and thus save the state of Nature for posterity. The written word travels far. Let it do its own particular good; that it may gain new and newer guardians of the silent places.

Here is an editorial in a newspaper that I think is worthy of reproduction.

"There is something wonderfully big in the nature of a man who performs a deed for the good of others without reward or even the hope of reward. There was a man in California who planted a forest of young pine trees on a mountainside, with the vision of forests in his soul. He dreamed of forests that he knew he would never see, because he was an old man. It was not for himself that he planted the trees but for the generations that would come after him. As we stood with him, on the mountainside one day, he said: 'You see the farms and orchards there in the valley below you, and you see those towns and cities. Well, Mesopotamia was like that in ancient times, but when the people had stripped the mountains of the forests the flood waters were hurled on the farms, and the cities, and destroyed them. We don't want that same thing to happen here, do we?'

'But suppose it were to happen,' we answered, 'you would not be here to suffer. You will have been gathered to your fathers, oblivious then to flood and famine.'

"That's true," he said. "But, we must think of those who are to come after us."

"Only for such men the world would be a hard place in which to live. If every man destroyed as he went along, and never builded, the earth would ultimately fail to support human life. Wherefore, to do a thing without hope of reward, and to stamp out a sin, while the blood is still in one's veins—these are the two greatest things that a man can do."

There is ample food for thought in the above. There is not an act tending to watchfulness and care of Nature's creations that is not set down in our book of life to our credit. There is not a man who takes from the storehouse of Nature sparingly, and only enough for his own needs, but that is doing a distinct act of good. There is no man who seeks to replenish the waters and woods with desirable wild creatures, feathered or finned, but that is doing his duty to mankind. There is no man who corrects his fellows in their acts of wrong-doing, but that is doing a mighty service for man, for posterity who should realize Nature in the fullness of her charm and abundance, as it was long ago. Ghastly were the inroads of the destructive lumbermen in the past, felling the timber right and left for hundreds of miles, taking but the very choicest pieces out of a gigantic log and leaving the rest of that timber and its denuded foliage lying there to dry, and form inflammable material to feed the awful forest fires, that have laid to waste billions of dollars worth of timber, made homeless countless people, and killed as many more. The destruction of the forests have sent the heavy snows into the streams, as water in a few days, where, with the forests standing, it took weeks, nay, months for it to melt and flow away. These abnormal conditions have swollen the rivers. The rivers have swept down, as along the Mississippi, and thousands of people drowned, made homeless, and all their possessions gone on down to the Gulf. The aftermath of man's lack of foresightedness is always misery and despair. The law of planting one tree to take the place of the one chopped down is a wise law and it should be universal. Our criminal wastefulness, our taking the best and leaving nothing behind us save destruction has been a subject of wide comment

in the older countries of the world who regard our prodigality with profound disgust. The cry that, "Nature is an inexhaustible store-house" is a thing of the past. Conservation in the future must be more than a catchword if Nature is to be spared and all that we hold dear be kept in beauty and as close to primeval conditions as possible. There are lands that are practically unfit for agricultural purposes, scattered all over the continent. These lands, however, will grow forests and are made beautiful by streams and lakes that are, or should be, filled with fish. Regions of this sort should be watched over and preserved not by a few individuals, but by all the people. When a person gets beyond his own self; when he can think with the thousands and look to their welfare and happiness as well as his own, he realizes fully the meaning of his duty to the community; his duty to mankind living; and posterity. When a man can think along a plane of this sort, forgetting, if need be, his own pleasures, that others may delight of the natural creations of Nature, he has aspired to one of the great goals in life.

As a consequence of the cutting down of the forests and the shrubbery along streams in general they have dwindled, and have often shrunk down to nothing. Where they seem to hold their own, they are, nevertheless, far from being of a suitable temperature for the continued habitat of the speckled brook trout. When the temperature of the water rises to over sixty-five degrees the brook trout is far from being at home. True to its desires of the past, the speckled brook trout is a cold-water, spring-water fish; truly the fish of the fountains. There are streams today that formerly were excellent brook trout streams but now they have few, if any, of this marvelous species. But these same streams have been furnished with brown trout or rainbow trout and have made quite a name for themselves in this respect. It will be remembered in the case of the brown trout that it has been called, ever since its introduction into this country, by the name of the German Brown Trout. As a matter of fact the brown trout came from England, and is England's trout, so to speak; in fact the brown trout is to England, in position, what the brook trout has been to America. The brown trout differs greatly from the speckled brook trout, the *fontinalis* of our streams, in that it can take up life in water far higher in temperature than can the speck-

led brook trout. It is for this reason that streams that have been depleted of brook trout, make, as often as not, excellent brown trout streams and afford anglers a meed of joy with each new season. The brown trout, (which is often called the Loch Leven), is a sticker, and it will cling to swift-flowing streams, if such be its lot. But then it makes a good all-around trout for planting, everything, of course, taken into consideration.

With the best intentions in the world, anglers generally make the mistake of planting a stream to speckled brook trout when the stream is not fitted, by reason of environment, to that species; owing to the trimmed away bushes and trees that formerly grew along its sides, also the fact that it may be more or less heightened in temperature. At great cost, sometimes, streams are stocked with *fontinalis* only to have nothing turn up as a result.

Ideal streams for any trout, and especially *fontinalis*, have trees and brush along their shores. Sunken logs and brush here and there not only furnish retreats for the fingerlings, but they are the haunts of the very insects that the trout live upon. With the banks of the stream denuded of bushes, with the stream clear of logs, weeds, etc., the food supply is so scant that it will not possibly be fit for planting. Where streams are thus robbed of their bank brush—alders and such should be planted in, and logs dropped in here and there. The thicker the brush along a stream, the more ideal does that stream become for the trout. Also where a stream flows through meadows, and is more or less inaccessible to man, ideal conditions may soon be arrived at.

It may truly be said that the larger these stream happens to be the more certain it is that the brown trout, the rainbow trout and the speckled brook trout will live together without one decreasing the other. But, of course, in the large streams there are small forms of fish life, shiners, chubs, etc., not to mention the young of the various rough fish—and these form food for the trout. It will be found, however, that where a stream is comparatively small, narrow to a degree and lacking depth, and lacking a suitable food supply the mixing of brown trout with speckled brook trout in that stream is bound to mean the depletion of the *fontinalis* by the brown trout, it being, merely, a survival of the fittest; a necessity; a matter of food that cannot be gotten otherwise.

Be sure your stream is a brook stream before you mistake and plant it to fontinalis.

GUNS & AMMUNITION

Hunting Experiences with Various Arms

ASHLEY A. HAINES

IN my article concerning suitable rifles for deer shooting which appeared in the March number of *Rod and Gun*, I failed to follow orders fired at me by the Guns and Ammunition editor, Mr. Landis, and wrote more concerning my opinions of different guns, models and calibers than of personal experiences, as Mr. Landis had requested. And yet I fully intended handing the readers considerable concerning experiences which will fall to the lot of a hunter when on the trail of the elusive mowitch, the most hunted of all big game in North America. I shall now try and make up any deficiency in this respect that existed in the article referred to, my only regret is that I shall fail to relate any of my experiences in as interesting fashion as many certainly could who may be tempted to read the grist this little typewriter is about to grind out. If, however, I should succeed in bringing before the reader's vision the trail of the elusive mowitch as he is being followed through the "beautiful snow," often descending to the depths of the deepest canons, up steep mountain sides, through thick and snow-laden brush, over fallen timber and along boulder-strewn mountain sides, right up to the end of the trail where the rifle's crack is followed by the unsheathing of the hunting knife, I shall be partly satisfied. But if in the remarks that follow, I should succeed in impressing on the minds of all hunters the importance of hunting the mowitch carefully, and, what is more important, the matter of making that first shot, when the game is finally sighted, a fatal one, I shall be then fully satisfied.

As mentioned in my March article I lost

several crippled deer years ago by failing to make that first shot a fatal one. This I have always regretted but, unfortunately, I am not the only one who has followed the trail of the elusive mowitch with similar experiences to relate if they would only hand us their experiences. After finally deciding that I would never shoot at a standing deer without being as certain as possible that I could see some definitely fatal spot in which to place the shot, I have never actually lost a crippled deer. Don't misunderstand me; I have shot standing deer since then that required another shot or so; but not many. Some running deer have been missed clean, some that required several shots before the knife could be called into service, but no crippled ones to get away. One standing deer, crippled by another, I deliberately shot through the hips simply due to no other portion of the animal offering a shot, and I feared if he jumped, as he certainly would had I manoeuvred for a more favorable position, it would mean a long chase with the probabilities of never seeing the end of the trail as the country was very brushy and heavily timbered. The deer fell and never regained its feet. But I *did* dislike shooting that deer through the hips; had it been running, the thing would have been different.

Another deer, one of the largest bucks I ever saw (at least I judged it to be from what I could see of it) I lost simply because I would not permit myself to shoot it through the hips, the only part of the deer I could see. I wanted meat as badly as any deer hunter that ever trailed a mowitch but I slid to a sitting position and with the little Winchester covering an open spot a few feet from where

the deer was standing and where I thought he certainly would pass when finally ready to move on, I patiently waited several minutes but never to fire a shot at him as when he finally disappeared it was in the opposite direction from what was expected, at no time more than the hips being visible to me. Yes, I regretted losing that deer but always felt better for the experience than to have crippled him, or to have secured him, a standing deer, by such an un-hunter-like proceeding as to deliberately shoot through the hips. Had it been a crippled deer, or a running one,—well that would have been another thing entirely.

Jay, my youngest brother, says it's no fun to shoot a standing deer as, so he says, he likes to take 'em "right out of the air," or, in other words, when on the jump. He, with his .33 Winchester, certainly has made an enviable record on deer under all conditions, and as I am out to give this deer shooting subject a brief write up from different points of view we'll begin with an experience in which a bit of quick lever swinging was really necessary in order to land the mowitch which we had followed the day before, camped on his trail that night and located right in his roosting place the next morning. Had ye writer been looking nearer where he was standing at the time instead of farther off, the deer should have been killed right in his bed. As it was the scribe was looking right over that deer across a flat covered with fallen timber and brush, and the deer but twenty-five or thirty yards distant! But the second our eyes met he was off like a shot, one shot, hurriedly fired, from my rifle found its way through the brush and crippled him pretty badly in one hip. A run of thirty yards or so gave Jay a very slim chance and he slammed a .33 through that big buck but a bit too far back to prove immediately fatal. Two or three more shots chased after that deer from each of our rifles as glimpses of him were caught through the brush at ranges from one hundred to one hundred and twenty-five yards or so when he disappeared in a brush-covered flat below us. Plenty of blood along the trail told us what we knew almost from the first,—that he was hard hit.

Stopping and overlooking the flat, Jay dropped his .33 into the hollow of his left arm and remarked:

"He's down there somewhere and if he goes out he is almost certain to try and cross that ridge over there," pointing beyond the flat about 150 yards or so. And after a

second's pause he added: "But if he does he's apt to run *pretty heavy to lead* before he gets across." And while I'd rather have had a standing shot at that buck and finished the work at once, I knew that Jay's prediction would surely prove true especially if the chance fell to him when the buck finally appeared. But after waiting several minutes and no deer showing up, Jay remarked:

"You stand here while I go down and 'shoo' him out; then give it to him as he crosses the ridge." This I readily agreed to. It didn't require much "shooing" on Jay's part for soon after he had disappeared in the thickest brush, I heard him sing out: "Look out! I heard him jump," then, a second later, "He's headed for the ridge, I think, by the racket," and a few seconds later I had my chance. The little .38-40 Winchester cracked four or five times, (I am not certain now, after several years, which), as the head and neck of the deer appeared through the tops of the fir brush as he ran towards the ridge; then he went down. Jay waited for me and together we followed the bloody trail to find the big buck down but not altogether "out."

Squeezing his way past the fallen deer, between it and a bunch of brush, Jay came pretty near being prodded by the sharp tines of the buck's horns, the only thing that prevented it being that the deer was too near "all in" though it was plain that he still possessed a willing disposition to undress a man even if it was winter weather with deep snow on the ground.

I do not remember how many times that buck was hit, but think seven or eight times. I do remember, however, of taking three .38-40 bullets out of that deer's neck, one of them, the one that put him down for keeps, having passed through the center of the neck bone between the joints but without breaking the neck, as almost invariably has happened with me when shooting a deer through the neck. A deer with a broken neck, it has been my experience, drops dead at the rifle's crack; but this one though shot through the neck, while down for keeps, was not dead as his neck was not broken.

Two more incidents where we shot up the game more than I like to think about and I will pass on to a few killings where less powder was burnt and which now always seems highly desirable. One good, clean kill I very much prefer to several where the game is riddled.

The first relates to a big buck killed near where the one I have just written about but

several years earlier. So far as we were able to judge, I only had one hit to my credit, this at about two hundred yards, the buck at the time lying down. As he fairly flew across the flat covered with fallen jack pine, my .303 Savage carbine and Jay's .30-40 Winchester were shot dry. Still the buck kept on but with diminishing speed to disappear over a ridge to be jumped a little later and to fall stone dead from a rear-end shot from Jay's .30-40 which was spitting the 220-grain bullets at a great rate. I failed to connect though it was no fault of the Savage.

Jay's fatal shot hit the deer, when about 100 yards off, and we both heard the bullet strike as plainly as though it had been shot into mud. In fact, it sounded very much like a rock thrown into thick mud. This was another deer with far more bullets in it than a deer hunter likes to see who prefers the one shot for each kill; but Jay was happy and I had nothing to complain about except my inability to steer the Savage straight.

Now for the "worst ever." This has never been in print and I had never expected it would, but I am out to state facts even if I am disgraced in the narrative. My nephew and I had seated ourselves on a mountainside to have our lunch, he on one end of a log which was balanced across a knoll with myself on the other. As long as we kept our relative positions all was well, but, well, something happened. Straight up the mountainside came three of the most badly frightened deer I have ever seen.

I jumped up and grabbed my .30-30 Remington trombone. Up flew my end of the log letting my nephew down with a bump. As he gathered himself together the log at my end came down on my heels quite forcibly, the whole thing not contributing to a successful start-off for piling up those three deer headed straight for us and not over fifty or sixty yards away.

I got the Remington into action first, the .33 Winchester my nephew was using being unlimbered immediately afterwards. I paid my respects to the largest deer in the bunch—a big doe—while the .33 opened up on one of the others which turned back down the mountainside later to be killed by my nephew. Never before or since had the Remington rattled out the shots as rapidly as on that occasion. At the first shot the deer swerved off to our left, disappeared in a gulch to appear a little later, still fiercely running, on the opposite side something like two hundred yards off or perhaps a little more. I

had emptied the rifle before they disappeared but managed to reload and fire two more shots as they appeared on the opposite side of the gulch. My nephew has never been certain whether he shot at the doe or not, but if he did he says it was not more than one shot; he was busy in another direction.

At the most not over nine shots at that time were fired, at her, eight of them being from my rifle. The question I kept asking myself when the battle was hottest was, "*Why doesn't she fall.*" I felt absolutely certain I was hitting that deer but not to see her go down was the surprising thing. Blood along the trail there was a-plenty but it was a long ways from there before that deer was finally killed. The shooting, however, was under a bit more favorable conditions, the first shot, broadside, being a standing one, the next two as she slowly walked along beside a fallen tree but she did not fall until the third bullet struck her. These three shots were easily covered with one hand and were grouped right where they should have been, just back of the shoulder. All told that deer was hit ten times, three of them in the throat close to the jugular, one through one ear, another in one hip ranging forward, one through the paunch, low down, the three back of shoulder and one other that I do not now remember where it struck. Some, naturally, will at once say the gun was at fault. Not proven! There are thousands of us who have killed plenty of deer with a single shot from the various makes of .30-30 rifles to know that this was a most unusual case and would not happen again in a thousand years. I shall always believe that had either my nephew or myself been alone, we'd have landed more meat and with less shooting for it has been my experience that when two or more are together one may expect a lot of unnecessary powder burning. I can't explain it but for some reason I fire more unnecessary shots if some one else is shooting at the game at the same time.

My eldest son, Howard, and I were out after mowitch early the first day of the season. His experience had been decidedly limited in deer hunting though he made good many times on smaller game. We were each using our .30-30 Winchester carbines, little guns good enough for any one for deer shooting under most conditions. While working our way carefully through clumps of fir trees and brush, a fine little buck was sighted, side on, about fifty yards straight ahead. My bullet caught it a little high

above the heart and the buck plunged straight ahead down the hill and was probably dead when he struck the ground. Had I not formed the habit years ago of slamming the lever the instant the shot is fired which always leaves me with the gun ready for an instant repeat shot, I would certainly have missed the chance for a shot at the flash of a deer that passed through the narrow opening where the first one had stood. As it was I only had to pull trigger. Howard's carbine and mine were fired so nearly together that neither knew the other had fired until afterwards. One of our shots passed through the big deer three inches above the heart and she was found stone dead about seventy-five yards farther on. It was quick work, the three shots being fired, I feel quite certain, in probably not exceeding two seconds—in fact there was not the fractional part of a second to lose. Last season, near the same place, we landed a couple of nice bucks in such quick time that there was little fun connected with it.

I'd have given the shot at the big buck to Howard but he was back of me a few steps and one doesn't find deer plentiful enough in our district to take chances on showing to another that they may have the honor of landing the meat but each takes his chance as it is offered. And yet I'd often promised to give him the first shot if there should be one offered with prospects of the mowitch not "evaporating" in the process of pointing out; and they usually have a habit of disappearing when it is most desired that they will linger just another second or two.

I was using my new .30-30 Winchester extra light, made-to-order little rifle with 22-inch light weight barrel while the boy was using his carbine as before. The buck fell out of sight as the rifle cracked while another appeared like a flash on lower ground, but ten yards nearer, to drop dead when I pulled the trigger. Again I pulled as the first buck staggered towards us and he went down near the second, both being very dead deer. Now for a surprise. The first buck had three bullets through the shoulders, Howard getting in a shot the very instant my rifle spoke the last time.

One of the bullets, undoubtedly my first, had landed slightly too far forward to have proved instantly fatal though I believe he'd have found it mighty hard going to have gone fifty yards. The four shots fired at the two deer all landed in vital places and so quickly did it all happen that it would have been

decidedly interesting to have had the time taken with a stop watch. Howard several times caught glimpses of another deer that persisted in hanging around down in a low sag, heavily timbered with plenty of brush to make the light poor, and several times raised his gun for a shot, but as he could never be certain of outlining the deer perfectly enough to make a certain kill, I advised him not to pull until he was sure where he would hit. Finally, after much whistling and stamping of hoofs, the deer finally left that quarter without a shot being fired. I presume ninety-nine men out of a hundred would have taken chances on a shot under such conditions, and especially would the temptation be great for one new at the game but I have cautioned the boy so often to be as sure as possible what he is shooting at, and to always try and place the bullet in some fatal spot, and not depend on luck to help him out, that it was not all difficult for him to hold his fire for a possible more favorable chance; and never have I heard him express a regret at not firing. Surely this is the proper thing to do—not take unnecessary chances—but I can assure any one that at his age it would have taken quick action to have prevented "yours truly" from slinging lead *somewhere* in the general direction of that deer.

One of the best, or perhaps some would call it luckiest shots, I ever made on a running deer, a nice fat two-year old buck, happened after this fashion. Jay and I had been laboriously climbing the mountain-side most of the forenoon looking for a mowitch trail. Jay, who invariably takes the lead, threw up the .33, then waited. With the little .38-40 cocked I also waited believing that within a few seconds something would happen. Then Jay lowered his rifle, stepped carefully to one side still looking closely straight ahead. Suddenly the rifle came up again, a second's pause and the .33 spoke.

"Did you get it?" I asked to which he replied;

"Yes, right out of its nest, but I had to hug the snow line on that big log mighty close." The deer, a two-year-old doe, had been lying down behind a large yellow pine log at about one hundred yards with but very little of her body showing above the six inches of snow that lay on top of it. The .33 plowed a hole through the snow and then passed through the deer's body a little high just back of the shoulders and that mowitch never moved from its bed. I told Jay it

was anything but a square deal and entirely inconsistent with his preaching to take advantage of a deer under such conditions for he should have at least said "shoo" a time or two and taken her on the wing. To which Jay answered that all was fair in war, love and deer shooting. I might disagree with him on two-thirds of his proposition but certainly would never argue the point on the mowitch part of it.

After drawing and hanging up the deer we continued on up the mountain where most of the day was spent looking for tracks, but failing to find any we dropped down the mountain in the direction where the doe had been killed in the morning intending to drag her home with us. Just below us an estimated one hundred and twenty-five yards, I caught sight of the two-year old buck as he just made one of the highest sky-scraping jumps I ever saw a deer make. Jay was in plain sight of the deer but failed to see it, (the light was poor or it was nearly dusk) until I exclaimed, but in a low voice, (the cautious deer hunter never speaks loudly even when a cannon's roar would do no harm).

"Deer dead ahead!" and jumped quickly to Jay's side where a better view could be obtained after he had passed a clump of bushes that shut off his view from where I had first seen him.

Then things happened and happened quickly. Bang! Bang! Bang!—the first and last shot Jay's. Quickly as it all happened, about like clapping the hands together three times, we both noticed that it was the second shot that sent the buck down with a broken back, both of Jay's shots missing though as more often has happened under such conditions, his shots should have been the scoring ones instead of mine.

"Wasted that last shot," Jay remarked as we descended to the bench below, "but hadn't time to throw on the brakes after your shot hit him." The .38-40 high velocity Winchester bullet after breaking the deer's back passed forward and was taken out of the forward part of one shoulder, having mushroomed nicely which is the thing that makes the killing bullet. Jay persists in saying that that was about the best running shot, everything considered, that he ever saw made forgetting the fact that many equally good, or more difficult kills has fallen to his lot. Especially do I remember his experience with one of his big bucks in which I shall always believe the very quickest Winchester lever swinging I ever witnessed, secur-

ed the prize for him, which was certainly deserved. You all know something of the automatic's speed? Well, just think of one of them with the trigger finger working at high pressure and you will have an idea of the way the .33 was spitting lead at the big buck that was trying to make its getaway and most of the lead finding the target. I was but a spectator, having secured my limit the day previously. There were plenty of fairly good chances during the trailing of that deer when, had I been out for blood, I should have had little difficulty in piling up that deer quite readily, but it seemed Jay was fated for only fleeting glimpses of the big buck as he would dash for safety on being jumped, several times only a shower of snow from the bushes through which he plunged being the only guide for the .33's that were sent in his direction. A very steep mountain side, plenty of standing and down timber, with the usual amount of brush, boulders a-plenty "bigger'n meeting houses," deep snow and a veritable blizzard howling which filled the air with blinding, wind-driven snow—imagine all this and you will wonder, as I did, how Jay managed to land most of his bullets in the big buck, not a single shot that fell to him the several times the buck was jumped offering even a moderately favorable chance for scoring. Jay has this head mounted as well as another still larger, the owner of which came near running over Jay who had never seen a track in the nearly all day's hunt. The deer's unceremonious appearance on the scene as he rushed past Jay at less than twenty-five feet, who was standing in thick brush with fallen timber piled high on all sides, brought forth a stream of .33's which had to come unusually quick under such conditions. Many a man would have been too surprised to have got the gun to the shoulder for a single shot, but the first .33 slowed the big buck up somewhat and by unusually quick work others found the right trail through the thick brush and Mr. Buck was venison.

I have several times spoken of my preference for the careful hunting of deer with the one deliberate shot that puts him down and out to the broadcast sowing of lead which so often happens when a deer is sighted and especially if that deer happens to be on the jump. And I still repeat that the deer that is patient enough to give me the one deliberate shot is the one I am after *always*. If he simply *won't* be good and stand still and take his medicine then, why, he'll have to take it

on the jump *provided I can steer my bullets straight.*

In this I have mentioned quite a bit concerning quick work with the rifle on deer when such work was the only kind that would answer. From this don't receive the impression that the writer makes a hobby of quick lever swinging. Years ago, say twenty to thirty-five, I learned the lever gun as well as I shall ever know it, and if a quick repeat shot saves the situation now the art I then learned, imperfectly perhaps, will be entirely responsible for it as, save occasionally at deer or coyotes, I have never, as nearly as I can remember, fired a half dozen quick shots from a lever gun since the time I was concerned in a bit of quick lever swinging back in 1911 or 1912, I believe, results of which were published in *Outdoor Life* soon after. Not fully as much as I realize the importance of that quick repeat shot, when properly placed and when needed, I could be perfectly satisfied and derive more real enjoyment from the use of a light weight, single-shot Winchester for deer shooting than with any repeater, for I always shall have a sort of reverence for the good old single shot though realize its limitations where quick work is essential just as well as the value of the repeater when such an arm only will fill the bill.

"See here, now," someone will say, "you've given us quite a lecture on shooting 'em up from their nose to the tail; now practice what you preach and tell us something about the ones you have killed by careful hunting with that one first and deliberately made shot—the method you advocate and the one which many of us practice." I had intended to and could hand the readers many incidents of killings, as well as many days of hard hunting that never offered a shot. But Jay says it fails to make interesting reading, this thing of getting your deer, usually standing, with just one shot; too tame altogether, and believing the average reader will agree with him has inclined me to relate the several incidents as set down in this article contending to the last, however, that following the one-shot-method will produce more dead deer for the powder burned and more clear consciences than where promiscuous sowing of lead is indulged in every time deer hair is sighted, the shooter too often trusting to luck for one of the many shots fired to find the vitals.

A few more remarks and we'll throw on the brakes for this time. My first deer, a fine white tail buck, was killed with a .40-65

Winchester. One shot and the deer on the fly; believe me, but he was sure going. Neck broken. Two hunters with me at the time, afterwards estimated the distance at not less than fifty yards. I disputed the point, claiming it was not over fifty feet. Measurement next day gave the distance as forty-five feet! Funny thing how many men *will* over-estimate distance. If they would step to the surveyor's chain more, and practice this until they could pace a hundred yards or several hundred, with approximate accuracy, carefully estimate the distance before the shot is fired (this when possible, of course) and *afterwards always*, and verify the distance by pacing, we would hear less of the exceptionally long shots which are so often so recklessly merely guessed at.

Here's a chance for being misunderstood. I believe game is often killed by men who hunt much and target shoot but little, far oftener and at greater distances than many of the strictly target shots imagine. All target shots are not necessarily hunters and it is just as certain, or more so, that all hunters are by no means target shots. The man who combines the best points of the two is the man who will score with the greatest regularity in the hunting field. But he will not of necessity (I am speaking of hunting under *average* conditions, remember) have a rifle equipped with the finest set triggers, elaborately engraved, fanciest of checked stock, nor will it always be ornamented with sights strung along its top story from the butt-plate to the muzzle. The man who has a good rifle (take your choice, there are many makes, models and calibers and if all but a half dozen were not made we'd get just about as much game though some of us might not be quite so well satisfied, for I doubt if there will be found a half dozen men who read this but have some "dream" rifle they would like to see materialize. Hey? What?) and is a good shot and hunter, and good judge of distances, will seldom have a hard luck story to tell at the end of the day if conditions offered when the deer was sighted were at all favorable.

On one hunt, years ago, using the .38-40 Winchester and good old fashioned black powder ammunition, I killed three deer with one shot each. With one of these guns which I now have, one shot per deer, both deer struck a few inches above the heart, both ran about three hundred yards before falling dead. "Don't want any such inferior gun as that for my deer shooting," I hear some

one say. Listen! With the .303 Savage I shot a deer through the heart, soft-point bullet, of course, and that deer ran about as far as the two just mentioned. Any one ready to say the .303 Savage is not a deer gun or the .30-30 Winchesters, Remingtons or Marlin's? Not me anyway.

I have shot, or seen shot, deer, plenty of them, through the heart, or in the heart region, which seldom fell dead in their tracks, and this with such noted deer guns as the .38, .40, .45 and most of the popular small-bores. Shall we say that they are not adequately powerful for deer simply because there are guns on the market which will practically shoot away the front quarters leaving us but the hindmost part as evidence that we have killed a deer? I like my deer with one shot, and I *do* like to see him go down stone dead at the crack of the rifle, but I *don't* want to see him "mussed up" too much. No, I'm willing to hunt a bit more carefully, do my best to pick a vital spot and place the one first bullet there just as often as possible even if I do occasionally have to do a bit of trailing before the knife act appears.

An incident of some little interest might be related here which will illustrate fairly well the care I take in recent years in being sure that I know what I am shooting at before allowing myself to pull trigger or anything that may look very much like deer, yet not absolutely sure concerning the matter.

It was down in the bottom of a gulch, the yellowish-white spot that so much resembled the rear end of a mowitch with the writer on the rimrock above some 40 yards away. The suspicious looking object was partly obscured by thick brush while heavy timber and fallen logs were everywhere in evidence. 'Twas a dark, cloudy, dismal sort of day which meant that the light, especially down there in the bottom of the gulch, was very poor and no object could be very plainly defined at best. I stood on tip toe, I squatted, I stepped backwards and then to the front, at all times straining my eyes to more perfectly settle the matter that was puzzling me; whether it was really a deer or not, and if so, what part of a deer, and if a fatal spot could be located in which to plant one of the little Winchester .30-30's. But I am confident that it must have been at least four or five minutes of this sort of very careful manoeuvring before the matter was settled to my entire satisfaction; then things happened very quickly. Whether he smelled me,

or saw me, or was just ready to quit the country I shall never know, but I do know that when he jumped it required quick moving to steer a soft-point Dominion through the brush at that rapidly vanishing mowitch to make venison an assured thing. A hurried second shot followed the first directed at the hole that mowitch made in the brush in his wild dash for safety, but that shot failed to connect, and was really not needed as the first had centred him and the buck was found very dead within forty feet of where he had been bedded when he made his first jump. *No, I've got to be absolutely certain what I am shooting at and will take all kinds of chances on losing any kind of game before a shot will be fired at anything however much it may resemble the game I'm after but about which there may be doubts as to its identity.*

I have notes before me of many other deer incidents I intended relating—deer fatally struck with the one first shot—but space is limited and as I have already exceeded my allowance this will have to be brought to a close. Deer hunting to me, when I can steal away from more important matters, is the king of all sports. Many a time I have returned after an unsuccessful day after mowitch so utterly worn out that it was an effort, I can assure any one, to give my rifle the cleaning and oiling it always *must* have before supper is taken no matter how hungry I may be, and I practically decided that I'd never be found in the hills again after deer. All day in the wet bush, soaked to the hide, with clothes frozen stiff towards night, not a track seen all day, except your own, is a far different proposition than a lucky day in which no hardships were encountered and the game seemed to make it a special point to be accommodating and look pleasant while you gave it the fatal shot.

After the hardships of the unlucky day, the time you have promised yourself (though you were too much of a hunter to ever breathe it to any one else) never to be found in the hills on such a fool's errand again, and you finally tumble into bed so everlastingly tired that you're too near asleep before you hit the blankets to pull them over you, your last thoughts concerning the hard luck that so often stares the deer hunter squarely in the face; the next thing you hear will be the clock striking three, possibly four, and the first thought that comes to your waking brain will resolve itself into a question something like this:

Canuck Shells Establish New Long Run Records

*The two longest runs at the
St. Thomas Tournament
were made with Canada
Shotgun Shells.*

Sim Glover 173
Rochester, N.Y.,

H. Kennicott 155
Evanston, Ill.,

*Remember these scores when
buying shells for use at the
traps.*

Dominion Cartridge Co., Limited
Montreal, Canada

"Good tracking snow to-day; wonder which way I'd better hit out any way?"

Deer hunters ever get discouraged? Sometimes, possibly, but it's a disease that seldom lasts over night no matter how hard the luck that may have been dealt him the

day previously. Here's to the persistent deer hunter, and especially to the one who hunts carefully and endeavors always to make that first shot the only one required that lands the mowitch ker-splash! in the frying pan.

Wanted---Better Hunting Rifles

E. G. G.

Why can't the American sportsman have up to date, American made firearms, especially rifles? He has the money to pay for them and the desire to own them and a splendid place to use them. The camera enthusiast has his up to the minute equipment and the fisherman has his supreme reels and modern equipment of all kinds. In fact, nearly every faddist but the gun crank is well taken care of. We have worried along with old fashioned cartridges and rheumatic repeaters, loose jointed take downs and pipe stem barrels, the one exception being our single shot rifle which is a good one. Why can't we have a modern bolt action rifle and some modern cartridges for it? I would suggest cartridges of .25—, .30—, .35 and .40 calibre for use in such an arm. These would cover the field from small to large game and simplify our list of cartridges as manufactured at present.

The .25 calibre with a 125 gr. bullet at 2800 F.S. and lighter loads would be the general all purpose gun. It would weigh between 7½ and 8 pounds and have a good stiff barrel with good sights. The question of attaching sights is an important one, there should be no weakening grooves or slots cut

in barrel. The .30-06 would make a good .30 calibre cartridge in a gun of 8 pounds weight and it could be had loaded with 172 gr. bullets at 2700 F.S. or better and would suit the man who wanted something heavier than a .25 calibre. The .35 calibre with a 250 gr. Spitzer bullet at 2600 F.S. would certainly take care of everything in America. For the man who wanted something heavier the .40 calibre with a 400 gr. bullet could be relied upon to suit the most fastidious, the latter, too, of course should be made in an arm of heavier weight to be in proportion to the heavier loads. In my opinion these four cartridges would cover the entire field for large game. The dyed in the wool crank could load lighter loads to suit himself and the small game hunter need not be deprived of his slide action and lever repeaters for target and varmint hunting. Such a bolt gun built of first class material, well stocked and sighted would find a ready sale among the American sportsman of today, I predict. And the live concern that furnishes it will be well repaid for their efforts. Let us hear from others who are interested in the improvement of American arms.

The One-Hand Gun Again

M. DE W. HEMMEON

IT seems a perilous thing to write of revolvers in a magazine to which Ashley Haines contributes but, hoping that he and your readers will pardon me, I take my life in one hand and try, impelled thereto by experience similar to those of Mr. Linkletter and others.

First, I am a poor shot with the pistol, the best I ever did being 11 bulls in 12 consecutive shots in the 3" ring at 25 yards. But for 20 years I have never been without a

big one-hand gun which I shot where and when I could not shoot the rifle, sometimes as much as 1200 rounds in one season.

The first big revolver I owned, and the best, was a .38 Colt, Officer's Model, in which I always used the .38 long Colt cartridge, loading my own ammunition. My last, which I still have, though I use it but little now, is a .38-40-180 Colt's New Service, and it is of this gun that I wish to write.

When I first tried it the only cartridges

Always Keep Your DAYLO on the Job

WHERE'S your "flashlight?" Lying forgotten in some bureau drawer? Or in your desk?

Get it out to-day and put it on the job 100% of the time. It's not a toy of a week or month—it's a year 'round necessity.

Liven it up with a new battery. Its strong searchlight beam comes only from a fresh, high-powered battery.

*Don't put it off.
Simply note the*

number

on the Eveready Tungsten Battery that fits your "flashlight" and ask any Daylo Dealer for it. You don't even have to take the light along.

There's an Eveready Tungsten Battery to fit every "flashlight"

**CANADIAN NATIONAL CARBON COMPANY
LIMITED
TORONTO, ONTARIO**

Have a regular place to keep your DAYLO—in the pocket of your car, on the kitchen shelf, in the top of your suitcase when you travel.

Accept no substitute for the genuine Eveready Tungsten Battery. The longest-lived, brightest-burning battery for Daylo or "flashlights."

within reach were factory loaded with black powder. Using these I found the gun fairly accurate, and although the revolver unloaded weighs 44 ozs., the kick was tremendous. When I began with smokeless powder, and my own make of bullet, one part tin to 20 of lead, accuracy at once fell off at least 50 per cent. Then it dawned on me, as it has on others, that the bore diameters of barrel and cylinder seemed two wholly different things. They were, by over 0".02. How could a bullet, cast 0".40, swedged down to 0".38 by the cylinder and let loose (loose is the word) in a barrel about 0".405 in diameter, be anything but inaccurate? Recovered bullets of my own casting showed only shallow marks of the lands and some slipping. Then I dug some of the factory bullets out of the stop and found that they had filled the bore completely. These bullets were pure lead and had hollow bases, and the black powder had upset them to the limit, though apparently not until they were in the barrel. Hence their accuracy. At once I started on my cylinder and reamed out the front end of each chamber to barrel diameter. I also changed from alloyed bullets to pure lead, and accuracy returned, better than at first, but not equal to the accuracy of the Officer's Model.

Now though I have long used the Colt and have never owned a Smith & Wesson, it seems to me that the Colt's New Service has inherent defects which will always keep it inferior to the Smith & Wesson in accuracy. First, there is no bevelled shoulder on the standing breech to force the cartridge about to be fired completely into the cylinder. The explosion of the powder drives the shell back and swells it where it is unsupported, immediately in front of the rim. Every shell has to be resized before it can be used again. Second is the difference in diameter between the bore of the cylinder and that of the barrel. Third, there is no front cylinder lock. Defect number two is the reason for defect number three. Load your Colt's New Service, hold it left side down, and you will see the joint open and the cylinder fall slightly. If cylinder and barrel were of the same diameter

and the gun were fired in this position the bullet would be severely bumped and maybe the shooter too. So, rather than add a front cylinder lock to the New Service, the Colt Mfg. Co. puts out a weapon cursed with inaccuracy from its birth. The S. & W. swing-out cylinder revolvers all have front locks operating automatically with the rear locks and, as a result, the cylinder always retains its alignment no matter how the gun be held.

Some features of the New Service seem to me preferable to corresponding features in the Smith & Wesson. I like the weight, not when carrying, but when shooting. I like the big butt; it is not too big for my hand, possibly because I do not hold and pull in the usual way. Out in the West where the S. A. Colt is the favorite I saw a man using a D. A. Colt, Frontier Model. He was called, by the way, "Wind River" because he 'operated' in that region, and as far as I know, had no other name, but that is of no importance. His method was to wrap all his fingers, except the middle finger, around the butt and to pull with the middle finger. His thumb too grasped the butt. This method may not suit every one, but it suits me so well that since I tried it I have used no other.

I would that the New Service had a front cylinder lock. Its shape and weight are so good, its mechanism so strong and simple and, after one has altered the sear to reduce the pull, so smooth in its working, that if it had such a lock, it would for me be superior to the Smith & Wesson. As it is, to one who puts accuracy first, the latter outranks it.

In irrelevant conclusion, may I put a few queries concerning which I should like to inflict my experiences on your readers in the future: (1). Why do the majority of men who own rifles never sight them in, and why does this sort of (?) rifleman always call a rifle "she?" (2). Why do so many riflemen in the N. R. A. and nearly all shooters outside it put such absolute and touching, but wholly groundless faith in the efficacy of oils and pastes as metal solvents? (3). Why do the cartridge companies nickel copper-jacketed bullets?

The .30 Luger

H. WALLACE

I may say that I have been a constant and interested reader of *Rod and Gun* for a good many years, and along with the other portions of good and instructive reading, follow closely

the "Queries and Answers" in the Guns & Ammunition department, and although I have at times been tempted to write as to my experience in connection with some of the

Looks good from every point

About sundown the finest view in the camp is that box of Heinz good things. Foods that go right to the right spot—hearty and appetizing, yet digestible. No trouble and no waiting. Easily carried—quickly prepared, absolutely pure. Just read this list and get ready:

Heinz 57 Varieties

HEINZ BAKED BEANS—Four styles, all oven-baked; with or without pork and tomato sauce. Good hot or cold.

HEINZ SPAGHETTI—Makes a sustaining dish of fine flavor which not only tempts but satisfies the appetite. Already cooked with tomato sauce and cheese.

HEINZ PICKLES—For a relish.

HEINZ CREAM SOUPS—Celery, Pea or Tomato, with real cream up there a hundred miles from a cow.

HEINZ TOMATO KETCHUP—The touch that makes all food taste better.

HEINZ PEANUT BUTTER—For all butter uses. It keeps sweet.

HEINZ PRESERVES—For the finishing touch.

Sold by all good grocers. Send for list of the 57 Varieties

H. J. HEINZ COMPANY, Pittsburgh, Pa.

arms or ammunition used, always seem to put it off until the next day, and then the day after, with the result that eventually it is forgotten.

In reading over the February issue I noticed a letter from a Revolver Crank, signed F. R. Daniel, Alberta. Now I am another of

portunity I had, and being out of the regulation targets made one with a compass, which I believe is the exact size of the standard target; I had not fired out of this gun for some seven months, but was pretty sure that the Luger would make a much better target than the results received by Mr. Daniels, and with

those animals (styled revolver cranks) though not a professional, or an expert, by any means, but I just naturally love a good revolver, pistol, or automatic, and my favorite for carrying in the bush is what is commonly called the .30 calibre Luger, and have found it to be extremely accurate and deadly on game, and although had never tried it out for target work, after reading the article by Mr. Daniels, decided would do so the first op-

portunity I had, and being out of the regulation targets made one with a compass, which I believe is the exact size of the standard target; I had not fired out of this gun for some seven months, but was pretty sure that the Luger would make a much better target than the results received by Mr. Daniels, and with

I can only account for the poor results obtained by Mr. Daniels in that you occasionally get hold of a Luger as well as other automatics with a very heavy pull, and think possibly he will find his trouble there.

Sights

J. G. E.

I was very much interested in reading "W. E. T's" article in your April number, re Targets and Sights, particularly the part of it referring to sights, and, I quite agree with your editor's remarks that his suggestions in regard to the former are novel and practical, but in regard to the latter—why so many notches?

I quite appreciate that the average gun crank has his own fads about sights, stocks, etc., and this article is written to give some of my fellow shooters the benefit of twenty years' experience. I have experimented with many different kinds of sights, peeps, telescope, etc., and, while they all have their spheres of usefulness, I have come to the conclusion that for fast, and all round shooting, the open sight is the only one worth while. The sights I use on my sporting rifle are, Front, Lyman Semi-Jack, Rear, King, the "V" of which has been filed out and nothing remains but the straight flat bar. The drop in the stock of my rifle so fits me, that when I check it quickly, my eye comes in line with the barrel, and the sight appears as follows:—

On the other hand, we will suppose in handling the rifle quickly you do not get as

low on your sight as the above illustration, and they appear thus:—

It matters little, except you have to keep a shade lower on your object. In all kinds of shooting I look at my object with both eyes open, and for fast work, I bring my rifle to my shoulder quickly, place the head of the front sight on the object, and pull—this is very effective in deer shooting, and I have had the very best of results. The average beginner, and some of the old school shooters, think they have to get the bead of the front sight into the V of the back sight, which to me is impossible, if you wish to do quick work. The peep sight is all right for target and long range shooting, but, as I said before, for quick short distance work, such as deer hunting, where time enters into consideration, give me the open sight, without any V's or wings to obstruct the object.

Have you ever tried sighting a rifle in this way? If not, take your .22, file down the back sight so that it will appear as a straight bar, and try it on a target, and I think, after you have fired a few rounds, you will agree with my contention.

I would like to hear from some of your readers on this subject.

A German Luger

P. G. PEERLESS

I am sending as I had promised, a picture of the German automatic pistol I mentioned in my last letter. The photo is too small to reproduce so I have drawn the pistol full size so that you can see it better.

This particular pistol was taken off the body of dead German officer somewhere near Ypres, and has hardly been used to judge by its condition.

I will describe it as fully as possible. Length over all is 8 ½ inches. Depth over all, 5¾ inches. Capacity of magazine about 10 shots. Length of breech 4 inches. Both

rear and front sights. Weight of pistol is 32 ounces. Caliber, uncertain just what it is, as the marking under the barrel is 8.82 M.M. It is nearly .38 caliber.

I have marked my drawing to illustrate various things. By pressing the button (2) the magazine(3) can be withdrawn. Four (4) is a square shaped loop for attaching lanyard. Some fellows say it is for a stock. At Y the date is marked 1913. At Z there is a crown and underneath it is the word "Erfurt."

The knurled knob is a means whereby

DU PONT CANADIAN INDUSTRIES

**Learn to break the targets
this month—**

**And you won't miss the
ducks next month—**

The duck season is short and holidays limited. The average man does not get enough practice in actual duck shooting to become an expert. But there is no "close season" for the clay pigeon, no long trips to the hunting grounds with the uncertainty of finding birds when you get there.

So why not decide to take up Trapshooting? Why not learn to break the targets this month, so you won't miss the ducks next month?

It will perfect your aim and your ability to judge distances and speed. You will find the same fascination in shooting at swiftly flying discs and just as keen satisfaction in hitting them as if ducks were your targets.

Trapshooting is in itself a very fascinating sport and the one way for the average man to become a skilled and accurate shot.

We will be glad to send you on application a copy of our booklet, "THE SPORT ALLURING," which is interestingly written and illustrated and contains much elementary and expert information on the art and sport of trapshooting. Send for a copy of "THE SPORT ALLURING."

E. I. Du Pont De Nemours & Company
WILMINGTON, DEL. U.S.A.

DU PONT

the breech may be opened by hand. This is done by catching hold of it firmly and slightly raising and at the same time pulling back. If the magazine is empty it stays back.

Of course, if there is a cartridge in the magazine it will not stay back, but when released pushes the cartridge into the breech. When fired the recoil pushes A against B which forces upward and opens the breech, extracts the case and the forward movement pushes in another cartridge.

By pulling down catch (1) the plate (C) contains a small lever, operated by the trigger, which releases the firing pin when the trigger is pressed.

The pistol can be taken to pieces (I mean all the working parts, firing pin included) except the recoil springs which I have not removed, without using any tools of any description.

The whole pistol is finished a good dead

black, more black than blue anyway. Hoping that this may be of interest.

Ed. Note.—This is a Luger pistol. Evidently a 9 M.M. I have seen quite a few captured pistols just like it in the last six months. The drawing is so good that I want to congratulate you upon your ability as a draftsman.

A Homemade Target Pistol

J. H. CHISHOLM

Having followed the game of target shooting with the .22 long rifle for several years I decided to try the pistol also.

I had had some experience with revolvers, principally pocket revolvers of the cheaper makes which leave much to be desired for target work. I also had one of those old .44 cap and ball Colt's that usually fired three or four chambers at once.

Later came a Colt's double action Army .45 with 7½ inch barrel. None of these were adapted to target shooting and being expensive to shoot my choice naturally fell on the .22 single shot target pistol.

Pistols cannot be purchased without a permit and these permits are hard to secure so the only thing left to do was to make a pistol out of a small rifle.

After examining several rifles I found the Hamilton would be the easiest to alter, so purchased a number .27 of the above make and started in. The stock was first removed, a piece cut off the tangs and new screw holes made for attaching the pistol grip. Next the stock was made from a piece of dry, hard wood and shaped to fit the hand as nearly as the design of the weapon would permit.

The barrel jacket was then removed and the barrel cut off to 10 inches, the muzzle filed flat and finished with an ordinary rose counter-sink. A small section of the jacket was left on the rear end of the barrel to hold the sight. The fore-end was removed and the opening in the forward part of the receiver filled with a piece of hard wood, the joint screw passing through and holding it in place.

PARKER BROS., Master Gun Makers **Meriden, Conn., U.S.A.**
New York Salesrooms, 25 Murray St.

The same spring that operates the hammer also acts as a trigger spring and of course the trigger receives the same strain as the hammer making the pull very hard. This was overcome by cutting a piece off the spring and putting a pin through the receiver from side to side on which the spring now rests.

A new trigger spring was made, the receiver drilled and tapped and the spring fitted and screwed down to place, giving a pull of about one pound. The hammer spur was bent up somewhat to facilitate cocking, the front of the trigger sharply checked and the cocking notch polished.

The trigger guard was bent into a neater shape and the portion which formed a pistol grip on the rifle, straightened, and fitted into the front of the new stock making the stock much more rigid.

The sights are from a 1902 Winchester, the rear one just as it came and the front filed down to suitable proportions for the small barrel. After these were dovetailed on, the entire pistol was given a coat of black enamel and the job was complete except sighting in.

This was done on a Winchester gallery target at fifteen feet, using Dominion .22 short Lesmok ammunition, and filing down the front sight until the correct elevation was secured.

The pistol is very accurate, as the accompanying out will show. The target illustrated is the best I have secured to date and shows

47 out of 50

45 out of 50

a score of 47 out of 50 on a bull the size of a dime, at 15 feet, offhand shooting. Several scores of 41 and 45 have been made at the same distance.

The completed pistol weighs about 20 ounces, and is very nicely balanced. The total cost amounted to \$3.00.

The Spoon That Hooks 'em Every Time!

The position of the HOOK is the reason. Hook releases when fish strikes and sudden stop when hook reaches end of slot sets the

hook firmly into jaw.

Darts and dives just like a real fish. Catches more than any other spoon or wooden minnow. Great for all game fish such as Black Bass, Trout, Musky, Pike, Salmon, Cod, Tarpon, etc. Made in six sizes. Ask your dealer for **KNOWLES AUTOMATIC STRIKER** or we will send it postpaid. Fully Guaranteed.

Queries and Answers

A Letter From Alberta.

Editor, Guns & Ammunition Dept.

I have just finished reading the February number and am in bed suffering with pleurisy and am writing this partly to pass the time and if it gets me into trouble hope that by that time I will be up and able to protect myself.

I am sorry that I do not see more letters from good old Alberta as no doubt it is second to none for both shooting and fishing, or we might say for Rifle, Gun and Rod. The prairie, I am sorry to say, cannot boast of anything in the line of large game but we have an abundance of prairie grouse, chickens, snipe, ducks and cranes. In some parts there are still a few antelope but I am very glad that they are protected.

It would take up too much space to describe the different varieties but it is sufficient to say there are several kinds of snipe, which are scarcely ever shot as there always seems to be something larger about to shoot at. Ten or fifteen kinds of ducks and four or five kinds of geese add to the sport and of course we have the most sport with the ducks, geese and grouse.

For our larger game we have to go off the prairie to the timbered part of the country, and there you can find everything from the little white tail deer to the king of the forest, the moose. It is quite a sensation, even for an old deer hunter on his first moose hunt, to hear several moose move off through the brush while he can see nothing. They have gotten his wind or something has gone wrong and they get wise to his location. It sounds like a runaway team and wagon.

I am not going to say anything about fish, only that we have lots of them any place where the water is good. Of course our sloughs and marshes have no fish as they have no running water. The North country is full of lakes teaming with pike, pickerel and white fish, also several other varieties and the foot hills and small streams have good trout fishing. Nuff-sed—as I am no fisherman.

Now what I really wanted to talk about was guns. I am quite a gun crank in my own small way and a fair shot, both with rifle and shotgun, and have managed to gather a few trophies. The best duck shooting I have ever done was 23 birds out of 25 shots, with three misses and one double on two birds with one shot. Now that may sound easy to lots of sports. To hear some people

talk, it really is nothing but let me say that in fifteen years' shooting I have never seen it beaten. Of course I am talking of wing shooting.

At the present time I have two shotguns, one 12 and one 20 gauge, both made by the A. H. Fox Gun Co., one single semi auto 22 made in Belgium, by Pieper, one 21 inch barrel Stevens Favorite .22, one .30-30 Winchester carbine with stock remodeled and checked and one cartridge length cut off the magazine, and last but not least, a .303 British Ross.

The shotguns are both good shooting guns but if you want hard shooting *and game* take the 12. In my opinion the 20 gauge shotgun is a toy. Of course in the brush country I believe it would be fine as it is light and quick to handle but—"Oh Boy!"—on the prairie where the big mallard gets up with its heavy coat of feathers, the 20 gauge is too light in the punch. My idea of a gun to be any good for actual shooting is a reliable make 12 gauge loaded with 3½ drams smokeless and 1½ ozs. of number 3 shot. Of course the gun must fit the man or he cannot do good shooting with it but that load in a good gun will get the ducks. It will not leave as many cripples for foxes, hawks, and crows and as far as choke in a gun is concerned, if you are a good shot you should have a good close shooting, hard hitting gun, but for the average shot or under, I believe a modified choke is the best.

About the rifles—I am not going to say much about the .22's as one .22 is as good as another as long as they are good shooters, and if they do not shoot good they are of no use to anyone.

The class of game hunted with a .22 is usually not very savage and in this country, is not very scarce. You are out mostly for practice and no doubt one can get a lot of practice with a .22 but the .30-30 carbine changes everything. With it you have different game in view. I think the ideal place for a .30-30 carbine is in the brush. Of course if you have long shots it is not up to the mark but in the brush 200 yards is a very long shot and I believe that three fourths of the game is shot at less than 100 yards. The little .30-30 is ideal for handling fast. You can carry it almost like a pistol and crawl through brush with very little noise, where if you have a heavy weight long rifle it takes both hands and far more care.

Just like getting a check

-30 cents of each dollar saved!

HASSLERS for all Ford Passenger Cars

Shock Absorber

TRADE MARK REGISTERED. PATENTED

The Hassler Guarantee: "Absolute satisfaction or your money back."

SUPPOSE your garageman gave you a check for 30 cents every time you spent a dollar for tires and repairs? Suppose he gave you a check each year for a third of the depreciation you know has taken place in your Ford Car or Ford One-Ton Truck? It amounts to exactly the same thing when you equip with Hassler Shock Absorbers. At least 30% of your tire and repair cost is saved outright, because the road shocks and vibrations are cushioned before they reach the vital and weighty parts of the machine. This elimination of vibration also reduces the depreciation loss in the same proportion. There is real economy—a real worth while saving! Of course, you know how much more satisfactory your car will ride if you have Hasslers on it. The added comfort alone is worth far more than they cost.

10 DAY TRIAL OFFER

Don't ride without Hasslers because someone tries to discourage you. They are a quality product—worth their price. The Hassler dealer in your vicinity will put them on for 10-days' trial. Your money refunded if you say so. Write for name of dealer and Trial Blank.

THE PARSONS & PARSONS CANADIAN CO.

HAMILTON, CANADA

Then again, one can walk much farther and not be tired with a light gun and it comes in very handy, when used as a walking stick on a slippery side hill. Taking everything into consideration, light weight of rifle, quick handling, light and easy to get ammunition, easy to clean and keep clean and fairly hard hitting, I think for the average game it is almost ideal. Most hunters, or would be hunters, claim it is too light for moose and while I have killed moose with the .30-30 probably it is a little light. That is why I have the .303 British Ross. As yet I have not had the opportunity to try it but hope to have this opportunity next fall and if all goes well I believe that it will deliver the goods. All I have against it at the present is the weight and the jump for offhand shooting.

Sometimes I overshoot unless I am very careful and when game is going out of sight I like to know that when the head swings on and I pull that the recoil is not going to put the bullet somewhere in the brush above the game. Probably, with a little shooting, that will disappear.

Right here let me say that if I cannot hold down the .303 it will stay at home and the 20 inch barreled .30-30 will go with me and it can deliver the goods too.

Now to try and sum up:—What the amateur hunter should use, in my estimation—I do not expect to tackle the Newton class or the professional target shot but I have tackled some of them on the wrong side sometimes. These people generally have plenty of money and it is a hobby with them.

For the amateur I will start and sum up with the shotgun. Get a 12 gauge, double gun, left full choke and right modified. Do get the drop, length and general dimensions of stock to fit and if you do not like a double gun get a model 1897 Winchester and you will have a very safe pump gun. Get the modified choke barrel.

For the .22 get any good reliable make, priced so that you can still buy ammunition and practice. Do not forget that one shot that is not cleaned out is just as bad as fifty so do not spare the oil. Keep your rifle clean. A rifle should never be placed away for keeping unless it has been well cleaned and well oiled.

I personally have no use for the smaller calibered rifles, between the .22 and the .30-30. I have shot such rifles as the .25-20 and no doubt in many parts of the country they are quite valuable, but here they are no good as

they are too expensive to practice with and when you are after deer if you cannot buy a .30-30 carbine, better borrow one.

If you are after moose, I have very little to say as for my part I would like something different from anything that I have seen. I think a .303 or .30-10-220, put up like a .30-30 carbine would be fine but you cannot get it so take a .303 or .30-10 or some other large "shoulder ache" and do your best.

Alberta.

Uncle Dudley.

The .43 Mauser.

Editor, Guns & Ammunition Dept.

I have just purchased a .43 Mauser carbine. Is it a good gun for moose and deer? Has it much recoil? Can you tell me where to get a reloading outfit for this .43 Mauser?

Vulcan, Alta.

Wilbert Rutter.

Reply.—The Dominion Cartridge Co. loads this cartridge with 78 grains of black powder and a 395 grain bullet. At that rate it would be a more powerful weapon than the .45-70. It would undoubtedly be a good killer on moose and deer. It would have about as much recoil as a .45-70 rifle of the same weight. This would be a fairly heavy recoil.

I do not know where you could secure a reloading tool for this cartridge.—Editor.

Reduced Loads for the .256 Newton.

Editor, Guns & Ammunition Dept.

Using the .256 Newton with 48 grains of DuPont number 15 and the 101 and 86 grain spitzer bullets, what muzzle velocity would I get?

How would this combination compare with the .25 caliber Springfield-Niedner?

How would the 87 grain spitzer of the .250-3000 Savage work in the .256 with 46 grains of 15?

Creston, B.C.

Reader.

Reply.—Not any of these loads would work at all because the bullets are all .006 too small for the bore of the .256 rifle, it is the one thing that has kept the .256 from being the most popular rifle made in the last 15 years. You cannot get accuracy even, velocity or anything else from any of these combinations because the powder would not burn properly, and the bullets would blow through the barrel like shot.

Newton certainly made a mistake when he did not make a .250 for the same style cartridge.—Editor.

Various Queries.

Editor, Guns & Ammunition Dept.

I have a shotgun with all the polish rubbed off. What would I use for rubbing it and where would I obtain the material?

I am reloading .30-30 Winchester cartridge and would like to know if I could use the soft point spitzer 150 grain bullet in it. Would the soft point bullets flatten in the magazine? If so could I cut off the points of the full patched bullets and use these?

How is the .256 Newton rifle for shooting large game?

Will a 26 inch full choke barrel shoot as close and as hard as a 30 inch full choke, in pump guns?

Is the bottom ejector of the Remington pump as reliable as the Winchester and Stevens side ejectors pumps? Which is the better shooter of these three?

Rosthern. J. B. Darkson.

Reply.—If you mean the stock is rubbed, use rough and then fine sandpaper to get it smooth. Then rub linseed oil in with the hand. If the bluing is rubbed off, rubbing will just take more of it off. Better send it back to the factory for rebluing.

I would not advise reloading with spitzer bullets in a .30-30 rifle with tubular magazine like the Winchester and Marlin rifles. The cartridges might discharge in the magazine. For use as a single shot, the load would be splendid. You could use the rifle as a two shot rifle, one in the barrel and another in the magazine.

The .256 Newton is a good big game cartridge. I have heard some complaints. I have heard complaints about every cartridge since David used a slingshot.

A 26 inch full choke barrel will shoot nearly as hard as a 30 inch but the pattern will not be as even and the recoil of a 26 inch barrel gun always feels mean somehow. Gun balances and swings stubby also.

I consider the Remington every bit as good a gun as the Winchester and I do not consider that the equal of either of these two has ever been produced in a repeating shotgun. Editor.

250-3000 and .30 Rimless.

Editor, Guns & Ammunition Dept.

I was greatly interested in the article on the .250-3000 Savage in the last issue and I am writing for more information.

How would the .250-3000 compare with the Remington .30 rimless on deer and bear and how do the recoils of the two rifles compare?

Is there any cartridge made or could one be reloaded for the .30-30 to give a velocity approx. 3000 f.s.?

What velocity is obtained by the 87 grain Savage bullet and 10 grains of DuPont no. 75?

Is the .250-3000 Savage made in any but the takedown style. Is this rifle powerful enough to handle anything heavier than black bear?

Vancouver. C. W. H. Howard.

Reply.—Not enough difference to worry about. The recoil of either is so light that you will not bother about it. The Savage has the flatter trajectory and will give less trouble from that standpoint. I would consider either rifle good for deer and black bear but I would not select either for larger game. Many hunters would be perfectly satisfied to hunt large bear and moose with either rifle but personally I would desire a rifle shooting a much heavier charge.

You cannot reload the .30-30 to secure 3000 f.s. which is fortunate as none of the rifles made for it would handle such a charge.

I would estimate about 1300 f.s. Write to the DuPont company for definite information. They will likely make the test and tell you the exact result.

The .250-3000 is not made in anything but takedown style. Not in my estimation. Others may have a different opinion. Charles Newton, who designed the cartridge set its limit at small bear and deer.—Editor.

Round Ball in a Shotgun.

Editor, Guns & Ammunition Dept.

Where can I secure 12 gauge shells loaded with round ball?

Where can I secure a mould for making the balls? Please give directions for loading them.

Demorestville, Ont. C. E. Johnson.

Reply.—From Winchester Repeating Arms Co., New Haven Conn., Remington Arms, U.M.C. Co., 233 Broadway, New York City, or Dominion Cartridge Co.

I do not know where you can secure such a mould unless James Brock, London, Ont., can make one for you.

These balls are loaded by cutting holes in felt wads and seating these wads both under and over the ball to hold it in the middle of the shell. You had better depend upon factory loads.—Editor.

Various Inquiries.

Editor, Guns & Ammunition Dept.

What is your opinion of the Savage model

The three words that tell the whole story of a perfect cup of coffee, from plantation to breakfast table——— "SEAL BRAND" COFFEE.

In $\frac{1}{2}$, 1 and 2 pound tins. Whole—ground—pulverized—also fine ground for Percolators. Never sold in bulk. 187

1905 target rifle? Would it be good for rabbits, gophers and other small game with the sights that come on it?

What is the best gun to buy for coyotes and wolves at ranges up to 600 yards and would a .30-30 Winchester or Marlin carbine be as good as a .303 British model 1895 Winchester?

What is the best way to clean rifles with ammonia and what form do you get it in for this purpose?

Vandura, Sask.

G. A. Lewis.

Reply—This would be a good little rifle for your purpose but it is not as good as the model 1914 repeater made by the same concern. Of course it is cheaper. The sights on the rifle are real good but the front sight had better be a gold bead.

The .303 British Winchester, when fitted with a peep receiver rear sight, would be a very good coyote and wolf rifle but a coyote or wolf at 600 yards is a rather hard mark to hit. I would suggest the .303 British Spitzer cartridge or else the 150 gr. Spitzer cartridge in the .30-1906 Winchester. I would not consider a .30-30 rifle of much use for shooting game at 600 yards.

To clean a rifle with ammonia, first get the ammonia, 26 per cent., at a good drug store. Then plug the breech of the rifle with a fired shell that has its neck securely plugged with a RUBBER cork. Take a small piece of rubber (hose) and fit it over the rifle muzzle. Two inches of it is plenty. Take a STEEL cleaning rod and let it gently down ONTO the rubber plug in the fired shell that is in the rifle chamber. Then pour ammonia into the barrel until it is full (the cleaning rod saves space in the barrel that would otherwise need to be filled with ammonia.)

Let it soak for fifteen minutes. Pour out and dry thoroughly. Then oil thoroughly.

You can also clean by using rags soaked in ammonia and then drying thoroughly. The thing to watch is that no ammonia DRIES off the inside of the barrel and rusts it and also—do not get an ammonia soaked rag stuck in the barrel or it will rust fast, also the rest of the barrel will rust at the same time.—Editor.

Brush Shells.

Editor, Guns & Ammunition Dept.

I am going to buy a Winchester pump shotgun with a full choke barrel for ducks and trap shooting and will use Brush shells for hunting. Please inform me if they are as good as claimed.

Toronto.

A. Ham.

Reply—They are all right for the first shot

when used in the brush. They are particularly good for shooting rabbits in briar thickets and similar places. I have killed 21 rabbits and lost three cripples out of 25 shots on one occasion with these shells. I do not consider that they pattern evenly enough for bird shooting. Often they are valuable for shooting birds in thickets, or for killing winged birds that have run into briar patches.

Editor.

A 16 Gauge for Deer Shooting.

Editor, Guns & Ammunition Dept.

I would like to know if I could use a 16 gauge single barrel shot gun for shooting deer? What is the price of the best sights for the gun and what is the recoil of the gun?

What is the meaning of the word gauge?

Levis, Quebec.

A. Hunter.

Reply—Sights, suitable for a shotgun, would cost you about a dollar per set. Either Lyman or Marble are O.K. A 16 gauge single barrel gun would probably have a recoil of about 25 ft. lbs. Depends upon the charge and the weight of the gun.

A 16 gauge is a gun that is of a size that will approximate 16 round balls to the pound.

I would advise you to get a rifle for I never thought much of deer shooting with a shotgun. Never liked the idea nor the results.

Editor.

A Rifle for a Young Bear Hunter.

Editor, Guns & Ammunition Dept.

I get your book and like it fine. Will you please tell me as soon as you can if a .303 Savage rifle is a good grizzly bear, moose, deer and caribou rifle.

Harry Madison, (Age 9.)

Reply—It is, but at the age of 9 you ought to do this kind of hunting in company with older men or otherwise you might have an accident. The recoil of a .303 would be severe for you. One of the .25 caliber rifles would suit you much better. Have some older man cut off the stock of the rifle so that it will fit you and then make your partner let you have first shot on easy chances. You will have ten times the fun and excitement killing anything at your age than you will have ten or twenty years later, but don't try bear or moose shooting alone.—Editor.

Concerning the .32-40.

Editor, Guns & Ammunition Dept.

Do you consider a .32-10 a good rifle for deer and large game? Is it a high power rifle?

EVINRUDE

Detachable Motor for Watercraft

With an Evinrude you can go quickly, without rowing, to the holes where big catches are almost sure. Distance makes no difference to an Evinrude owner.

Variable speed, suitable for trolling. Swift, smooth, flexible power for canoe, rowboat and other craft.

Built-in flywheel type magneto. Automatic reverse. Maxim silencer and tilt-up arrangement if desired. Our special method of balancing practically eliminates vibration.

Nearly 100,000 Evinrudes have already been sold.

The Evinrude is used by 25 governments.

I enjoy your magazine very much. There is no magazine like it for outdoor sport.

G. R. P.

Reply.—The .32-40 High Power Savage and Marlin cartridge is a very good cartridge for deer and similar game. Savage and Marlin rifles adapted to it are of a size, weight and balance that carry very well on the trail and are fast in getting into action.—Editor.

Various Questions.

Editor, Guns & Ammunition Dept.

What is the best caliber of the model 1892 Winchester for deer?

Is it practical to reload the .25-20 cartridge? What does one gain by reloading?

What is the muzzle velocity and penetration of the .25-20 Winchester model 1892?

Can you tell me a way to remove rust from a gun barrel?

How is the .25-20 for foxes?

Compton, R. I.

F. Farrell.

Reply.—The .44-40. None of the calibers in this model can compare with the 1894 model in various calibers for the same kind of hunting.

It is practical and profitable to reload the .25-20 or any other low power cartridge. You gain in accuracy, cost and satisfaction and very considerably in knowledge. Also you either gain or lose considerable patience in so doing.

Muzzle velocity is 1380 foot seconds. Penetration 8 inches in soft pine.

With coal oil or with Winchester rust remover and a brass brush.

The .25-20 is a very good rifle for foxes at not over 100 to 125 yards.

Editor.

The .303 British Winchester.

Editor, Guns & Ammunition Dept.

I have purchased a .303 British Winchester. Just what is this rifle capable of? What is its striking energy, trajectory, velocity, and also what recoil?

What accuracy could one reasonably expect at 200 to 500 yards?

I have shot my moose and have taken exactly 7 well placed shots to bring him down and on the other hand I have seen a moose stopped and finished with a single shot out of the .38-55. The latter was out in mid-stream when shot and he finished his ford, lay down and died.

I expect to go after grizzly bear in British Columbia and do not want to go after such game with inadequate tools.

It would simplify matters if you would handle this inquiry on the basis of use for moose, deer and grizzly bear. Its good points and its shortcomings.

Would it be better to have two separate rifles?

I realize that you know and will most decidedly act upon your advice as this is your province just as I would act upon the advice of a good physician. Provided of course, that your advertising columns do not enter into the matter.

I await with attention the edition containing your reply.

Montreal.

J. R. Pontley.

Reply.—This rifle is a perfectly reliable big game hunting rifle. Its one defect is poor carrying qualities due to the magazine being just at the point of balance. Have a receiver folding leaf and gold bead front sights put on and sighted in correctly, and you will be well fixed for any American game.

With proper sights I would expect 8 inch or better accuracy at 200 yards and 20 to 25 inch 20 shot groups at 500 yards. Kick is too small to bother about. You have a good heavy rifle. Bear and moose load 215 grain blunt point soft point bullet. Muzzle velocity 2005 f.s. Muzzle energy 1920 foot pounds. 200 yards trajectory 6 inches. 500 yard trajectory 52 inches.

With the 174 grain spitzer bullet, best for open country shooting, and deer, Muzzle velocity 2450 f.s. and Muzzle Energy 2320 foot pounds. The 200 yard trajectory is 3 inches and over 500 yards it is 29 inches.

I never answer an inquiry to please one particular advertiser. When that time comes if it does, this Department will have another Editor. I say what I believe to be true.

Editor.

Rebluing the Receiver of a Rifle.

Editor, Guns & Ammunition Dept.

Could you tell me how to reblue the receiver of a rifle?

Listowel.

J. R. Wood.

Reply.—Send it back to the manufacturers who made the rifle. It will be the cheapest and best in the end.—Editor.

BUFFALO N.Y.

The 1918 Tournament of the Nova Scotia Guides' Ass'n

ALBERT J. BURNS

THE annual tournament of the Nova Scotia Guides held each year, usually in August, at Lakeside Park, Yarmouth, N. S. is without a doubt the greatest sporting event of its kind of the Maritime Provinces.

The Guides Meet brings together each year the guides of this province and neighboring provinces, and attracts hundreds of sportsmen from Canada and United States; men of the great out-of-doors who enjoy the shooting, fly-casting, water sports and good fellowship which exists among such a class of men.

Lakeside Park is an ideal spot for the sports, and the large number of tents pitched on the grounds together with the booths, flags and bunting add to its attractiveness.

The meet for 1918 was the most successful ever held and when you come to know the men who are back of it you can quite readily see that it could not be otherwise and each year it will be better as new attractions are added.

In the rifle off hand shoot there were over one hundred and forty competitors whilst there were quite as many in the trap shooting. The running-deer target attracted much attention. Out of the one hundred and forty in the rifle shoot, twenty three tied on the highest score and had to shoot off for the twenty one prizes, so you can readily see that competition was keen.

In the water sports the programme was equally attractive and the events held the attention of the crowds throughout both afternoons. In the canoe racing both the doubles and singles were very exciting and the winners were roundly applauded. The work of the Indians, John and Steve Glode, in the canoe rescue race showed remarkable skill.

The canoe tilting, log racing and burling as done by James McLeod of Brookfield, Queens Co. and the Bower boys of Clyde, Shelburne Co. kept the great mass of spectators thrilled with excitement.

The log-chopping event was another that attracted the throngs and when Judson Gray of Kemptville severed his log in forty four seconds that he won the hearty applause of all present.

The story telling contest was held on Friday evening at the band stand. The competitors on an impromptu platform told their stories to a vast audience and the prizes were awarded according to the reception each

received. Here the honors again fell to Judson Gray who showed that he could not only chop logs in record time but could tell a good story as well. With the assistance of Gordon Roberts, a fellow guide, he very vividly demonstrated his story which if space permitted I would endeavor to repeat; but if you ever meet "Jud" ask him to tell it; he has a lot more particularly about moose-hunting which I imagine are worth hearing as well. There are some other star story

William G. Hill

tellers amongst these guides. The prize of ten dollars and fifty cents donated by Mr. Otis Wardwell of Boston, Mr. Gray divided evenly with his assistant Mr. Roberts.

One of the principal attractions at the meet each year is Wm. G. Hill the Maine "crack-shot" who has built up a reputation by wonderful feats with firearms. Mr. Hill used Remington-UMC arms and ammunition and in the swift handling called for in many of his "stunts" he is unequalled by any shot in the

NORTHERN ONTARIO

This vast new land of promise is one degree South of Winnipeg, and is big enough to include the six New England and four Middle States of the American Union.

Aside from its immense resources in timber, mineral, waterpower, fish, game and scenery, NORTHERN ONTARIO contains millions of acres of fertile, arable land fit for mixed farming which may be had by returned soldiers and sailors in 160 acre blocks free; to others, 18 years and over, 30 cents per acre.

Already there are thousands of miles of colonization roads and steam railways spreading like a spider's web over a huge part of that immense forest-robed territory.

KING FOLDING CANVAS BOAT CO. 465 Harrison St., Kalamazoo, Mich.

land. Firing a .22 Remington Repeating rifle he hit before they reach the ground, empty cartridges ejected from the same rifle—thrown objects as small as beans, peas, No. 4 or 5 shot; in fact any target that can be seen in the air. Using a .35 cal. H. P. Remington Autoloading rifle he shot at five oranges flung into the air at one time, and before they reached the ground, smashed them all. Shooting a Remington pump gun he ejected from it two empty shells and after hitting a target thrown at the same time, drove both empties out of sight before they reached the ground. Three objects thrown at once were broken with the same gun turned upside down. And the trick was repeated with the high power Remington Autoloading rifle held similarly. Shooting the Remington high power slide action rifle four eggs thrown at the same time were broken in midair. He performed, too, all sorts of double mirror feats with rifle and pistol.

Sheriff H. A. P. Smith of Digby, N. S. also did some fancy rifle and shot gun shooting which was well worth seeing.

The professional trap shooting by W. G. Hill, Rem. U. M. C. Co., G. M. Wheeler, Hercules Powder Co. and W. N. Boyleston and R. N. Burns, two of the best shots of the United States attracted much attention.

Mr. James McLeod of Brookfield, Queens County, was awarded the beautiful silver cup donated by Mr. Wm. McLaughlin, for the grand aggregate. Mr. McLeod was only a short time before the meet invalided home from the Western front being wounded and shell shocked. As Mayor Grant of Yarmouth who distributed the prizes announced to the audience that Mr. McLeod was the winner of such a handsome trophy and also told of his career since the out-break of the war he received an ovation that will long be remembered.

No doubt this year there will be quite a number of guides returned from overseas who will attend the meet and who will be given a hearty welcome home.

The prize winners of the various events were as follows:—

FANCY SHOOTING

A—Exhibition of Fancy Rifle and Shotgun Shooting by Wm. G. Hill, representative of Remington Arms U. M. C. Co.

B—Trapshooting Event by W. G. Hill, Remington U. M. C. Co.; G. M. Wheeler, Hercules Powder Co.; and W. N. Boyleston and R. N. Burns, two of the best amateur shots of the United States.

C—Special Amateur Shoot.

Nova Scotia Guides' Business Meeting

The annual business meeting of the Nova Scotia Guides' Association was held at the park and proved to be the best and most progressive ever held. The president, Bernard Cummings, of Port Joli, occupied the chair and during the evening it was learned that one hundred guides' licenses were issued at the park the previous day, whilst there were upwards of thirty-five who had secured licenses from the Chief Game Commissioner's office, Halifax, previous to coming to Yarmouth, making a total of nearly one hundred and thirty-five guides which, without an exception, is the largest number that has ever attended the annual meet.

President Cummings, in calling the meeting to order, spoke briefly, expressing the pleasure it gave him to hold the honored position that the association, for the past year, had seen fit to bestow upon him. He reviewed the work done during that period and thought that at times although, to a degree, he may have failed in some measure on matters concerning the association, he had always given them his first and careful consideration. In his opinion the present meet was the largest ever held and considering its object and purpose, to assist the Canadian Patriotic Fund, it would ever be held, in that respect if in no other, as an historic event for Yarmouth town and county, if not for the Province. He said, "we have no greater duty before us to-day than to assist in every possible manner those men, and many of them our brother guides, who are battling for us in Flanders."

President Cummings extended sincere congratulations to one of their number, James McLeod, who had gone forth, did his best, was wounded, invalided home and was in Yarmouth for the tournament. "Our fellow-guidesman," continued the president, "was a sniper over there and if he, like the Indian of old, could have put a notch in the stock of his rifle for every Hun he had sniped his rifle would have been in need of a new stock long before the German sniper got guide McLeod."

The chief business of the meeting was the election of officers and on motion of Ellison Gray, of North Kemptville, seconded by Forman Gavel, of Gavelton, the officers of last year were held in office for the ensuing year. They are as follows:

President, Bernard Cummings, Port Joli; Vice-Pres., Thomas Davis, Upper Clyde; Sec'y-Treas., Roy S. Kelley, Yarmouth.

Council—Ellison Gray, [North Kemptville; John H. Lewis, New Grafton, Queens Co.; A. D. Thomas, South Milford, Annapolis Co.; Sheriff H. A. P. Smith, Digby.

The matter of changes in the big game laws came up, but the president did not deem it advisable to take any action as nothing could be done until next spring.

Secretary Kelley explained some existing difficulties which now prevail, owing to the international treaty governing migratory birds made between the Dominion and United States Governments with which the

H. A. P. Smith, Former President,
Nova Scotia Guides' Association

local legislature could not deal. He had heard and knew of objections on every hand, but thought for the time being or until after the war it should be realized that we must all give and take a little.

Mr. Buchanan, representing Chief Game Commissioner Knight, gave a very interesting explanation of the game laws as governed by that treaty. He also extended to the meeting the kindly regards of Capt. L. D. Mitchell, a former president of the association from whom a letter had recently been received from Saloniki, in which he particularly stipulated to be remembered to all the guides at this meet.

Sheriff Smith spoke regarding the treaty and how it protected Canadian wild geese.

He was strongly of the opinion that the question particularly touching on that fowl is not thoroughly understood by those making the game laws, for that bird does not migrate from Canadian to United States waters and back again. Last winter he visited Port Joli and for the first time he fully realized just how honest the Nova Scotia sportsmen were. Whilst there he reckoned there were one hundred and fifty thousand of those birds quietly swimming about and living right there in Port Joli harbor. Yet not one was shot. He considered it a great hardship and at times very trying for gunners, such as exist in those parts, to leave those geese unmolested.

President Cummings showed the meeting that the Canadian wild goose never goes south but, he said, a southern goose comes to Nova Scotia waters and a most peculiar circumstance exists right here. The native wild goose will not mingle with the stranger and he had seen time and again huge flocks of the southern geese come into Port Joli harbor, but they were distinct and absolutely apart from the native. Another feature about them was that they were much smaller. The native when dressed will weigh from seven and one half to ten pounds, whilst the southern strain will only tip the scale at from five to seven pounds.

After considerable discussion President

Cummings, Sheriff Smith and Fred Graham were appointed a committee to draft a resolution asking the powers controlling the game law to make some change which would allow an open season for geese.

The moose season also came up for considerable discussion and many expressions of opinion were given as to the best ways and means of preserving the moose.

Ellison Gray thought the moose season was too long and he asked why some steps could not be taken to have an open season on beavers for, in his opinion, there are at least ten of those animals about the rivers to-day to one of any other fur-bearing animal to be found in our forests.

Other speakers were Walker Andrews of St. John, who gave a very interesting address concerning the moose laws of New Brunswick; C. C. Burrill, Pres. Cummings, David Marling, and it was finally decided by James Bower, seconded by M. Bower and C. C. Burrill, and passed unanimously that a recommendation be made to the game authorities to prohibit the sale of moose meat.

Another motion by James White, of Berwick, seconded by E. Skinner that a resident big game license of \$2.00 be imposed on all hunters and the returns from such licenses to be used for the patrol of the forests and protection of the moose and other game was passed.

Coon Hunting With Dogs

THE 'coon is a wily little animal and his habits are very interesting to note.

He is a veritable trickster compared with which the proverbial cunning fox must take a back seat. One of the 'coon's most

common tricks employed to fool the hound is known among hunters as "tapping the tree" and which he accomplishes in this way: when he hears the hound's first note baying on trail, he climbs up a large tree, runs to the

furtherest extremity of one of the largest branches and doubling himself up into a ball, leaps as far as possible out from the tree. This he repeats several times on different trees, then makes a long run, only to go through the same performances in another place. Onward comes the hound, till he reaches the first tree the 'coon went up and if it is a young and inexperienced hound, he will give the "tree bark" until the hunters reach the tree, fell it, and find the game not there.

All this time Mr. 'Coon is quietly fishing and laughing in his sleeve, perhaps a mile away. But not so with the wise old 'coon hound. The old, experienced 'cooner, with seemingly human intelligence, no sooner reaches the tree Mr. 'Coon has "tapped" than he begins circling around the tree, never opening his mouth ——— circling wider and wider until he strikes the trail again. This he repeats every time the 'coon takes a tree, until finally, when he has to take a tree to keep from being caught on the ground, the hound circles as before and, finding no trail leading away, he goes back to the tree, and with a triumphant cry proclaims the fact that he is victorious. He is not the least bit doubtful. He knows the coon went up the tree and he knows he has never come down so he reasons (?) that the coon is there, and with every breath he calls his master to come and bag his game. When the tree is felled the fun begins. The 'coon is game to death. He dies fighting—and such a magnificent fight it is! The uninformed might suppose there would not be much of a fight between a 50-pound 'coon hound and a 20-pound 'coon. Well, there is not, if the 'coon hound is experienced and knows his business. Of course, the 'coon will put up a masterly fight, and sometimes help is required to put him out of business; but the old 'coon dog will finally kill any 'coon. But if the fight is between a young or inexperienced dog and a full grown 'coon the chances are that you will suffer the mortification of seeing your dog tuck his tail between his legs and make for home at a very rapid and unbecoming rate of speed.

Killing a 'coon appears to be an art with a dog, of course, much more easily acquired by a natural born 'coon hound than by a dog of any other breed. A year-old hound of good breeding and from good 'coon hound parents, can kill a 'coon with less ado about it than half a dozen of any other breed with the exception of an Airedale terrier. The Airedale makes a splendid coon dog especially in water work. The best possible combination to have is a

coon hound and an Airedale trained to work together. It is in swimming that the 'coon is most difficult to handle. I have known several hounds to be drowned by 'coons in deep water. The dog goes for the coon, and the 'coon gets on top of the dog's head. Down they both go, and, of course, the dog and the 'coon both let go their hold on each other. Again the dog grabs the 'coon, and under the water they both go. This is repeated, until the dog becomes exhausted, his lungs fill with water, and old Mr. Coon seems to understand the situation exactly and seats himself firmly on the top of the dog's head, holding him under water, till outside assistance is all that will save him from a watery grave.

As there is but little chance—practically none—to kill a 'coon while he is swimming, the wise old 'cooner on to his job, will seize the 'coon, strike a bee line to the bank, and kill him on terra firma.

Another of the tricks Mr. 'Coon uses to advantage when closely followed by hounds, is to follow the meanderings of a stream until he comes to a log reaching across to the other bank; then he runs to the middle of the log and leaps as far as he can out into the water, usually swimming down stream, if he is not making for a den or a tree in some other direction. This ruse invariably delays even the best of 'coon hounds, as, being about full speed, they will run across the log, and if the dogs know their job they will circle out until they again find the trail; but during this momentary bother, the 'coon is not waiting to see what they are going to do about it. He keeps moving and I want to say that a 'coon is a much swifter traveller than many persons suppose. He loses no time, but keeps everlastingly at it, and it takes a speedy hound to force him up a tree.

The 'coon may be defined as being a dwarf bear. They have many points in common. The 'coon can lie up in his den for weeks at a time during severely cold weather, without food or water. The only difference between the foot prints of the coon and those of the bear is the size. In shape and appearance they are exactly alike. The flesh, when cooked, tastes similar, and not one in a thousand could tell any difference between cooked 'coon and cooked bear, if served in same size pieces.

By nature the 'coon is a very selfish individual. He deserts Mrs. 'Coon when the children are a day old and lets her provide for them as best she can. The young 'coons grow rapidly,

and at a tender age of from six to eight weeks old they begin to accompany their faithful mother in search of food. Fishes, birds, rabbits, nuts, acorns, berries and green corn are the principal dishes on the 'coon family's bill of fare.

At first the little coons stay close to their mother's heels, but they grow more venturesome as they grow older, and soon begin to make little journeys on their own account. This often proves their undoing when dogs are about. Any sort of an old dog can tree or catch on the ground a baby 'coon, but this is an advantage no true sportsman will knowingly take.

That a mother 'coon will even brave death herself to save her babies is evident to one who has studied the habits of the 'coon. When closely pursued by the hounds and she and her young are all compelled to go up the same tree as soon as the hounds begin to bark fiercely and the hunters arrive and begin to chop on the tree or try to shine their eyes, old mother 'coon picks an opening and jumps out of the tree and is usually caught, or runs up another tree close by and then caught. But she has again saved her young as in all likelihood the hunters will not go back to the tree where the little coons are serenely sitting on the leafy boughs, or never think of there being any more coons there.

There are many reasons why the 'coon hunt is fast becoming one of the most popular of the manly sports. The 'coon is found in many sections of the country. Other game is becoming very scarce. The wealthy business man, the man of affairs who is tied to his desk six days out of the week, can own a 'coon hound and in the stilly hours of the night after the day's turmoil of business, can enjoy a few hours of the most strenuous sport

now left to us and witness a battle royal between his faithful hound and the monarch of the woods, the wily 'coon. Nothing that I can contemplate is more exhilarating or more soothing to the nerves than the excitement of the 'coon hunt. From the first long-drawn note when the trail is struck until the hound's victorious cry at the tree, it is one round of excitement and anticipation. What or whose hound is leading? What direction will Mr. 'Coon take? What dog will be first to tree? And then the fight! It is simply great! And then showing the hide to the boys who didn't go and telling them about it for days to come.

The 'coon hunt calls for manhood. Tender weaklings cannot endure the exertions necessary to enjoy this sport. It is too strenuous for the lazy man or the effeminate man to enjoy. They shudder at the thoughts of donning a pair of heavy hip boots and tramping through swamps and slashes, crossing creeks and barbed wire fences, through briars and thickets maybe for several miles, and the probability of getting lost and having to stay all night. But to the man with nerve and backbone this is one of the enjoyable features. It affords great fun to get a tenderfoot to go out for the first time and initiate him into the "coon hunters' club." The tender-foot will use every cuss word ever invented, and will coin new ones when the supply of old ones becomes worn out and ineffective. He will cuss the briars, cuss the ditches, cuss the creek, cuss the fences, cuss the swamps, cuss the slashes, cuss the man who persuaded him to go, and finally cuss himself for going. But when the excitement of the chase is on and when the fight commences he becomes reconciled; and if good luck is had he is very likely to be the next man to propose another "coon hunt."

Montreal Spring Show

The Montreal Kennel Association Spring Show May 23 and 24, was a splendid all round success in the number and quality of dogs shown; the attendance and the hospitality of the Montrealers; the judges and their work; and the M. K. A. Show Committee and their work. There were some who found fault with the way the catalog was printed and also with the rather light and cramped benching used but then with the enthusiasm present at this show, these defects

were easily remedied by those taking sufficient interest to do so, for their personal benefit.

Of the 400 dogs in the show, wire haired fox terriers were the leading and most interesting entry. Montreal fanciers are keen on wires and classes. They are always very interesting especially so this year for some heavy plunges have been made in well bred U. S. stuff and then there is the good home grown ones always coming along; and the home bred ones did most of the winning; being more the

It Can't Go Off by Accident!

They were breaking camp. Sam came hurrying down with the last load of equipment, which included the revolver.

Somehow it slipped and fell—loaded—with a heavy thud at his feet. But it didn't go off—it was an Iver Johnson.

IVER JOHNSON SAFETY— AUTOMATIC REVOLVERS

The Iver Johnson can't go off by accident. Drop it, thump it, bang it, throw it against the wall—it won't go off. Just one way to discharge an Iver Johnson—pull the trigger *all* the way back.

Drawn tempered piano-wire springs keep the Iver Johnson *permanently* alive and alert. And the perfect rifled barrel speeds the bullet straight as a streak of light.

Choice of three grips: Regular, Perfect Rubber, Western Walnut.

Three Booklets Free

proper size. The fox terrier must be kept a small dog or he is not a fox terrier, i.e., he can not follow a fox to ground. Stock by Ch. Dusky Bound is coming along well and was well up in the awards. Mrs. Webster of Ottawa with her good little Lady Wireboy of Pargntor took winners, bitches and reserve winners, also 1st maiden and 1st breeders with the Lady's daughter, Spicey Lady. Sam Bamford of Toronto took winners dogs with Ch. Miceys Model, while Moore and Strachan of Montreal were reserve winners with Rigeways Dark Boy, a noted U. S. dog, a bit large and lacking finish.

Airedale terriers were also a large entry but a mixed lot, large and small, good coats and bad coats, good ears and eyes, and poor, in fact all the good points and all the bad points which so easily crop out in his breed, were to be seen at this show. If our Airedale breeders cannot learn by experience how to breed good ones they should read up and study out how the good ones are bred and follow these methods.

That great show dog and sire Ch. King Nobbler's Double who has not been shown much of late years, easily took winner's dogs, looking as good as ever and his latest kennel mate, Parkton Sweet Olive, took winners bitches though I thought her a bit fine all over and too much of the Irish spirit, which is not all wanted in an Airedale. Rosecroft Jersey Lightning was res. dog and Miss Romulus res. bitch. Murby of Toronto took 1st puppy dogs with Harvie Warlock while 1st puppy bitches went to Colne Mistress Oorang. Mr. Robinson also of Toronto. Claycliff sentry, Jos. Russell, Toronto, took 1st novice and 1st junior and would have won more had he been entered in the other classes. This is the dog we spoke well of when first shown at the New Year's show in Toronto. The Lachine dog Bolton Boy is an attractive looking one, well shaped and had he better eyes and skull would make a good one. He won well, beating Claycliff Tenacity.

There was just an ordinary showing of Pointers and Setters, the good dog Ch. Perdreaun being best Pointer. The English setters were all of a large strong rough type which while certainly not classy looking may be all right for work in certain country. The Irish Setters were much better showing, the results of more careful breeding to type. We

had the pleasure of seeing one of the best Irish setters in America, in Tyrone Larry bred and owned by E. C. Howard of Montreal. This dog won very well at the last big New York Show and when shown there next year we venture to say he will top the lot.

Cocker Spaniels were just a good ordinary showing; while there were no real high class ones present still there were some good ones.

Bostons had a large entry, including the good ones from Toronto and Ottawa. Irish Terriers were also a good lot the winning dog, Mendon Mike being 3rd best dog in whole show. There was also a good showing of Scotties. Several variety of Toys were shown, a good lot of Pokes and Poms.

Some splendid English bulldogs were shown besides good entries in bull terriers, French bulldogs, and several of the other breeds including Russian wolfhounds. There were no fox hounds or beagles at this show.

The judging of the breeds was finished Saturday afternoon, the varieties and specials follow Saturday evening and by 11 o'clock the big event of the show came off, picking the best dog in all the show. In this event there were two French Alsace police dogs; two Belgian police dogs; two Irish setters; four wire fox terriers, including Ch. Dusky Bounce and Ch. Mickey's Model; two Japanese spaniels; and one each of the following English Bull; Skye terrier; Cocker French Bull; Dalmatian; Airedale, and Pekinese. With the exception of the two Alsace Police dogs they were all good specimens as fine a lot as one would see most anywhere. The wire fox terrier Ch. Lady Wireboy of Paignton was awarded best in-show and then the two judges had to confer as to next best or reserve which finally went to the Airedale Ch. Polam Maxim closely pressed by the Irish terrier Mendon Mike.

The judges of this show were Chas. Mason on Anglo-American from N.Y. one of the best all round judges in the world, a breeder and Kennel writer of note; the other was Norman Swire of Toronto one of our most gifted young men along this line.

While this was a ribbon show yet the money offered for specials and the silver cups and trophies made the winning worth while. For instance the winner of the puppy Sweepstakes gathered in some fifty dollars.

Frostco Combination 8 in 1 Steel Rod

has reinforced joints and patent locking reel seat. The illustration shows four combinations in a fly rod—reverse the handle and you have four combinations in a bait rod. Irish Rifle Association

J. W. SMITH

AN attractive program has been arranged by the Irish Rifle Association for this season at the Long Branch Rifle Ranges. The usual competitions will run throughout the months of July, August, and September, with valuable prizes (in kind) for each of the three classes, winners to be decided by each competitor's ten best scores of the four months.

On August 4th, Civic Holiday, the Association will hold their Annual Matches open to all-comers, cash prizes only. Conditions in these Matches will conform as closely as possible to those of the approaching O. R. A. meet, and the program will probably include snap-shooting and rapid-fire events. This will provide a fine opportunity for those intending to participate in the O. R. A. shoot to avail themselves of some preliminary

practice, and any riflemen interested should communicate with the writer (257 Davenport Road, Toronto) who will be glad to mail them a program.

The standard of shooting to date has been poor; with two exceptions, notably Mr. Dean, who has shown a very high degree of marksmanship. Mr. Dean was trained entirely by this Association, and has never shot at any of the big Rifle Association meets, and therefore ranks as a "tyro."

Many ex-members have returned from overseas, and are re-joining the I. R. A., besides which there are a number of new members, some of whom are beginners, whilst others are old marksmen who desire to resume practice. Judging from some record attendances in June, the I. R. A. will have an exceptionally successful season.

The following list shows the scores of the last five weekly practices of those who have attended at least three times and whose average is over 90 to date:

	May 31st.	June 7th.	June 14th.	June 21st.	June 28th.	Average

FISH SANCTUARIES.

Canada applies the sanctuary or reserve idea to fish, as a means of increasing their numbers and promoting better sport.

Upon recommendation of the Victoria Fisheries Protective Association of Baddeck, Nova Scotia, the Canadian Minister of Marine and Fisheries has ordered the setting apart of one brook on each of eleven different rivers in Cape Breton Island, for the natural pro-

pagation of trout and salmon, and has prohibited angling in these brooks for a term of three years.

As has been proved in game matters, a small section left fully protected the year round as a haven, has always benefited the shooting in the adjacent country. This same plan should improve fishing by allowing many fish to spawn that otherwise would be caught, and by making these reserve brooks serve as nurseries and feeders for the main rivers.

Matters Pertaining to Conservation

The Need of Nation-Wide Effort in Wild Life Conservation

C. GORDON HEWITT

Address Delivered at the National Wild Life Conference on Feb. 18th at Ottawa

THIS National Conference marks an epoch in the history of the movement for the conservation of wild life in the Dominion. Convoked as it has been by the Commission of Conservation with the co-operation of the Advisory Board on Wild Life Protection, it represents the first occasion on which an endeavour has been made officially to bring together those who through their official duties or public or private interests are concerned in the protection of our game and fur-bearing animals and wild life generally. All to whom our wild life has any significance have been invited: officials of Dominion and Provincial governments, representatives of sportsmen's and game protective associations, of the fur trading companies and of the railways. And the international significance of the problem that we are to discuss is evidenced by the presence of those of our friends and co-workers from the United States who have accepted our invitation.

During the last decade there has been in Canada an awakening to the fact of all our natural resources the wild life was the most sensitive to human interference, and there has been a realization of the responsibility that rests upon our shoulders as trustees of the greater portion of what remains of the big game animals, of the breeding grounds of the wild fowl and of the most valuable fur bearers of this-continent. The manner in which the wild life over most of the United States has suffered through lack of adequate protection has furnished an object lesson that Canadians have not been slow to learn, and while wanton destruction, excessive and unwise killing have taken place throughout Canada, the

comparatively small population has not depleted our wild life so well favoured in haunts by Nature, and we are still fortunate in possessing a fair proportion of our original stock of game and furbearing animals well distributed over the country. We have convened for the purpose of determining the best methods by which we can conserve our wild life for the use and enjoyment of the people of to-day and of the future.

Before we commence our discussions I should like to emphasize two points, which are vitally important in their bearing on this subject, namely: The desirability of the greatest degree of co-operation and the necessity of foresight.

Taking the last point first, why should we not now resolve to use that faculty which distinguishes us from our fellow creatures and exercise our reason, which should make us provident? In the past it has been almost an invariable rule to wait until serious depletion of game animals has taken place before instituting protective measures which, had they been in effect earlier, would have prevented such depletion. Why should we continue to be so lacking in foresight and those attributes that make a nation progressive as to be unwilling to provide against contingencies that we know from experience will occur. Conservation is practical foresight. No natural resource needs the application of greater foresight for its conservation than our wild life for it cannot be replaced once it is destroyed, and its destruction can only be avoided by wise provision. Let us therefore resolve to look ahead of the present requirements and plan with our eyes on the future.

But the chief object of this conference is to secure as great a degree as

SAVAGE

the rifle you asked for

WE take pleasure in presenting to our friends the latest product of the Savage Arms Corporation, Utica Works—the new Model 1919 Bolt Action Rifle.

This rifle is the result of years of experimental work, guided and checked by the ablest military and civilian experts.

It is the most serious instrument of precision that has ever been manufactured to shoot .22 rim-fire ammunition. Designed especially to fill the exacting requirements of National Rifle Association small bore match shooting.

The .22 Savage N.R.A. is a genuine miniature military rifle. It is a bolt-action, five-shot repeater, with full length military pistol-grip stock and swivels for sling. It can be used in every position, with every time-limit and for every kind of fire that the .30 Service rifle can. The only match condition that need be changed is length of range. And it will beat the Service rifle at 100 yards.

A new rifling system makes the barrel more accurate than other .22 caliber models used in this work—and Savage reputation for accuracy made the experts select us to build this rifle.

A new firing-mechanism—lightened moving parts with less than half-inch travel, long, husky mainspring and two-point firing-pin—make ignition instantaneous.

The Marine Corps type front sight defines clearly in any light, and the simple, strong aperture rear sight has click adjustment for elevation and windage—one click moves shot one-quarter inch on target at 25 yards.

25-inch round barrel, full military stock, oil finish, pistol grip, sling swivels, Marine Corps type front, and wind-gauge aperture, rear sights. 5-shot detachable box magazine. Chambered for .22 Long Rifle cartridge only.

And remember—it's as good for small game shooting as for target work.

25 Yards—10 Shots, 1/2-in. bull, by Marine Gunner J. L. Renew, U. S. M. C.

50 Yards—9 Shots, 1 inch bull, by Marine Gunner J. L. Renew, U. S. M. C.

possible of co-operation in order to further the objects we all have in view. A significant change has taken place in our attitude towards wild life. Formerly, game laws were framed more with an eye to human advantage than for the benefit of the wild life. Our wild life resources were regarded as a convenient and easy source of revenue and the issuing of game licenses was the principle function of the game officer; the same attitude of mind existed in regard to our forest resources which were regarded as a valuable source of public revenue in the shape of licenses and stumpage fees and not as an economic asset requiring wise conservation. But when the limits of the so-called inexhaustible come within the range of our perception, when the instinct of self-preservation comes into play and we hasten to make such amends as may be made by endeavoring to save what

remains. The true game officer to-day is more concerned in protecting such game as remains than in issuing licenses for its destruction and if we are to retain our game resources, their conservation must necessarily constitute the main function of the game officer: he must be truly a game guardian or warden.

This broader conception of the significance of our wild life and of our attitude towards it has in turn brought about a greater sense of our responsibility with regard to the future and a realization of the fact that the conservation of wild life is not a matter which any one province, state or territory can undertake alone, but that its successful prosecution demands neighbourly co-operation and mutual assistance. The extent of our success in protecting our wild life will depend on the degree of our co-operation.

In every sphere of activity the spirit of co-operation is growing, in industrial labour, agricultural production or international conduct, co-operation is replacing separate effort. Similarly, in conserving our wild life we are appreciating the necessity of co-operation. So long as our migratory birds were subject to excessive destruction during their winter sojourn in the south and their spring migration northward our efforts to protect them in their breeding grounds was likely to prove unsuccessful altruism; the conservation of these birds demanded international action and now we are endeavoring by mutual co-operation to protect them. This conference will afford an opportunity of discussing the means whereby we may co-operate in this problem to the best advantage.

Indeed, there are few phases of wild life conservation which cannot be promoted with a much greater degree of success by mutual co-operation between governments than by individual effort. In the regulation of the fur trade, which we propose to discuss, the enforcement of the best laws that a government can devise may be seriously hampered by the limitations that provincial or national boundaries place upon the

jurisdiction of such governments. The same difficulty is met where contiguous governments have different policies; for example where a provincial government such as Saskatchewan or New Brunswick prohibits the sale of game and an adjacent province permits it; the absence of uniformity in policy leads to infractions of the law and trouble in enforcing it. While it is too much to expect uniformity in all cases, it cannot be denied that a much greater degree of co-operation than exists at present can be secured and we believe that the best mode of obtaining such co-operation is by such a conference as this.

The migratory tendencies of most forms of wild life annul the effect of provincial or national boundaries and the results may be for good or for evil; a territory carrying on a wise protective policy with regard to its game or furbearing animals will bring about an overflow into the more depleted contiguous areas; or an area in which an ineffectual policy for the control of predatory animals will serve as a source of supply to neighbouring territory. For good or for evil contiguity has an effect on the wild life. In the control of predatory animals it is now obvious that complete success can only be obtained by co-operative effort.

There is abroad in Canada an impression that the Dominion government concerns itself little, if at all, with the actual protection of wild life. This impression may have been justified by apparent inactivity in former years, it is not justified to-day, and the proceedings of this conference afford confirmation of the fact. While the Dominion government has left to the provinces the protection of the game, furbearing animals, other wild life within their respective territories, it is nevertheless responsible for the protection of the wild life over an enormous portion of Canada, namely, the Northwest Territories, the Yukon Territory, and in the Dominion Parks. And in order to carry out our national obligations with respect to the treaty with the United States for the protection of

migratory birds, it has assumed the guardianship of our migratory birds, which is being undertaken with the practical co-operation of the provincial governments. The legislation governing these matters is administered by the Minister of the Interior. In order to supervise the enforcement of this legislation and conservation of wild life as might be referred to the government, there was appointed two years ago, on the recommendation of the Minister of the Interior, an Advisory Board on Wild Life Protection, which is composed of a representative from each of the Departments concerned in wild life conservation, namely, the Departments of the Interior, Agriculture, Mines (Geological Survey) and Indian Affairs, and the Commission of Conservation. The chief activities of this Advisory Board up to the present have been the drafting of the legislation under the Migratory Birds Treaty and the revision of Northwest Game Act.

The policy adopted in respect to the protection of migratory birds serves to illustrate two points that I should like to bring out; first the possibilities in the way of co-operation between the Dominion and provincial governments; and second, the useful functions of our Advisory Board as an instrument for bringing about or facilitating co-operation between the Dominion and provincial governments, inter-provincial or international co-operation, all of which as we cannot insist too often, are essential to any policy for conserving our Canadian wild life. In regard to the first of these points, the government's policy in the administration of the legislation carrying out the Migratory Birds treaty is to rely on the provincial governments, so far as may be possible, for the enforcement of the provisions of the treaty within their respective territories. With this end in view most of the provincial governments have already amended their game laws to conform with the provisions of the treaty. Where assistance is necessary to secure the adequate enforcement of the regulations it is intended to

furnish such assistance; and where it may be necessary for the Dominion government to enforce the regulations under the Migratory Birds Convention Act owing to the failure of a provincial government to do so, the Dominion Government will live up to its obligations under the treaty which is by no means a "scrap of paper," but the most far reaching measure that has been yet put into operation for the preservation of our valuable bird life. A great responsibility rests upon the Dominion Government in this matter in as much as it is solely responsible for the enforcement of the regulations in the Northwest Territories which now constitute perhaps the chief breeding grounds of the greatest number of the migratory birds of this continent.

It may not be out of place to discuss as briefly as possible the conservation of the game, fur-bearing animals and wild life of the Northwest Territories, on which subject I have addressed the Commission of Conservation at previous annual meetings. The Commission recommended the revision of the North-west Game Act in 1916, and that revision was subsequently undertaken by the Advisory Board on Wild Life Protection, a new Act being passed in 1917. The new Northwest Game Act and the Regulations passed thereunder have two main features; first, the needs of the wild life in the Northwest Territories are more adequately satisfied; and second, the fur resources receive a greater degree of protection by the institution of a licensing system for trappers and traders, thus providing a safeguard against exploitation by unscrupulous individuals or companies. The Canadian people generally fail to realize, chiefly because they lack the information upon which to form an opinion or do not give the subject a thought, what an immense economic asset the wild life and particularly the fur-bearing animals, of the Northwest Territories constitute. Reliable statistics of the fur production of these vast territories are unavailable, and in passing, may I say that we

hope that one of the results of this conference will be the development of a scheme for securing reliable statistics of one of the country's chief natural resources, the resource that first attracted the outside world to our shores. But it is safe to say, that millions of dollars worth of furs of the finest quality obtainable are exported annually from our Northwest Territories. Furs constitute the main available resource, and capturing fur-bearing animals is the occupation of practically the entire population of those territories at the present time.

In an address which I gave before the Commission of Conservation two years ago on the conservation of our Northern fur resources, I pointed out that the Danish government administers the fur trade of Greenland as a government monopoly and has thus been able to exercise a great degree of control with a view to ensuring the conservation of the fur resources, and, what is of still more vital importance, the conservation of the health of the natives by protection from foreign traders. So far as I have been able to ascertain this policy has met with success. Why should not a similar policy succeed when applied to our Northwest Territories? The policy of state ownership of public utilities has its adherents and opponents, but the state ownership of natural resources is not in the same category and the state ownership of certain resources such as forests has undoubtedly proved successful from both the point of view of conservation and of revenue. A discussion of this subject in these introductory remarks would be out of place and I have enlarged upon it elsewhere. It is desirable, however, that all who are interested in the conservation of our wild life, and particularly the fur-bearing and game animals, should consider the suggestion that these wild life resources in the Northwest Territories might be administered as a government monopoly and for three reasons: first, as a means of securing adequate protection for these resources; second, as a source of revenue, and third, in

order to safeguard the native population which is dependent upon and is the chief means of harvesting the crop.

In addition to the protection of wild life in the Northwest Territories and the Yukon and of migratory birds under the international treaty, the Dominion government is actively conserving the wild life in another direction, namely, by the establishment of natural reservations under the Dominion Parks Act. The wild life in all the national parks is protected and these parks comprise an area of nearly 8,000 square miles. But certain parks such as the Wainwright Buffalo Park, the Foremost Antelope Reserve and Elk Island Park are maintained solely for the conservation of native mammals that would otherwise have been exterminated. The Commissioner of Dominion Parks, who is also charged with the enforcement of the Northwest Game Act and Migratory Birds Convention Act, will no doubt give further details regarding these Dominion game and wild life reserves when he opens the discussion on game sanctuaries which is one of the subjects that it is desirable to consider at this Conference.

In the establishment and maintenance of wild life or game reserves in Canada there are unlimited opportunities for co-operative action between the Dominion and provincial Governments. In fact, the reserves in the provinces of Manitoba, Saskatchewan and Alberta are co-operative in character, inasmuch as such reserves are chiefly established by the provincial governments in Dominion forestry reserves. We feel, however, that closer co-operation is both desirable and possible, particularly in the matter of the appointment of wardens for such reserves. A wild life reserve fails in its object to a very large extent unless it is adequately patrolled; there are law-breakers everywhere, both white and Indian, and if a reserve lacks sufficient protection, it will be a reserve in little more than name. The wild life inhabitants of a reserve must receive protection both from human enemies

and from the predatory animals that will be attracted to such an district providing more abundant food.

In the conservation of our wild life, one of the chief factors we have to consider is the native, whether he be Indian or Eskimo. His attitude towards the subject is naturally different from ours and he affords a problem that demands sympathetic treatment and careful consideration. The Deputy Minister of the Department of Indian Affairs is a member of our Advisory Board on Wild Life Protection, and, in consequence, it is possible for us to give the fullest consideration to questions arising out of the relations of natives to our wild life and to take such action as may be deemed necessary and advisable. As this question will be discussed during the present session of the Conference, it is unnecessary to say more in this introductory statement than to point out that it affords, perhaps more than any other question, opportunities for co-operation between the Dominion and provincial governments, and one of our desires is that this meeting and our free discussion will result in a greater degree of mutual understanding and co-operation in dealing with the problem of the Indian in the future.

In the foregoing remarks, government activities in the conservation of wild life have been chiefly considered. But, unfortunately governments are more apt to follow than to lead public opinion in questions of this nature. Consequently, the creation of a strong public opinion on the necessity of conserving our wild life is essential. It is essential not only from the point of view of promoting the ends we have in view, but also in order to carry out effectually such measures as may be established. The Commission of Conservation has taken the lead in educating public opinion in Canada as to the importance of conserving our wild life resources and in promoting measures to effect such conservation. The work that has already been accomplished has only served to indicate how much greater an effort

is necessary. The assistance of all organizations concerned in the protection of wild life is essential. In a country so rich in game animals, it is surprisingly how few associations there are of those interested in the protection of such animals. There are a few associations of sportsmen scattered through the Dominion, but how many of these ever endeavor actively to promote wild life, conservation or exert themselves except when their immediate interests are involved? Such associations of sportsmen should become active centers of propaganda for wild life conservation, not confining themselves to merely selfish interests but dealing with the subject in a broad public-spirited manner. Further, we should like to see associations of persons interested in wild life conservation, both sportsmen and nature-lovers, organized throughout the country. The effect of such organizations would be incalculable. Not only would they serve to educate the public but they would be able to assist the governments in the effectual enforcement of the game laws. Where we now have one game protective or sportsman's association there should be at least ten. The possibilities of mutual co-operation between such associations and the governments are infinite. In no way could an endeavour to promote nation-wide effort in the conservation of wild life meet with greater success than through the assistance of such organizations of sportsmen, of guides

and of nature lovers, in a word, of all who are directly interested in the adoption and carrying out of all measures that have for their object the preservation of our wild life resources.

Time will not permit a further review of the various directions in which our fur-bearing and game animals and wild life generally may be more successfully conserved by co-operative effort, not only between governments but between organizations and governments. The need of such nation-wide effort was never so pressing as it is to-day. We shall never again have such an excellent opportunity of attaining by mutual effort the ends for which we are individually striving, as we have now. Everywhere ideas are in a state of flux and the extent to which they crystallize out in forms that will promote the welfare of the country as a whole will depend upon the justice of the cause, the weight of public opinion behind it and the prescience of our governments. A great responsibility rests upon those of us who are endeavoring to form and guide public opinion and at the same time are called upon to advise on the conservation of this and other resources, but we can discharge our obligations with a greater degree of success if we work together with the same ends in view, and, instead of limiting our vision by regarding our problems as local, make our cause a national one.

F. V. Williams' cover painting, in June issue of *ROD AND GUN*, depicting a cat with a robin in its mouth and standing in a trio of nestlings, evoked great praise from contributors to the magazine. The story that accompanies the painting is entitled *Nimrod* and may be found on page 35. We are taking the liberty of publishing two of the letters received, commending the cat extermination campaign:

"FELIDAE vs. AVES"

A LITTLE BIRD TOLD ME, in a way I will not reveal, that, if we humans do not co-operate for the protection against cats, the awe inspiring carol of the Whip-poor-will,

the merry chirping of the Song Sparrow or the throaty warble of the Robin will soon be only memories of our Little Feathered Brothers.

It is estimated that there are 2,500,000 cats in Canada—perhaps twice that many and practically all of these cats gain part of their living by hunting. Vagrant cats, abandoned cats, surplus cats and cats gone wild, form probably the most dangerous destructive force, when their numbers are considered, that insectivorous and game birds have to cope with.

The New York State "Cat Law" of 1918, provides that "any person over the age of

Mr. U. E. Germain, Montreal, and 42½ lb. Musky caught with Rush Tango Minnow — "Field and Stream" and Rush Tango 1918 Prize winner.

Get 'em Like This!

You surely can. Thousands of professionals, amateurs, women and children are making record catches of all kinds of game fish trolling or casting with all models of my Rush Tango Minnow.

They're the liveliest baits that float. They wiggle, dive and swim like a minnow in action. The Tangoes get the big ones—Bass, Pickerel, Pike, Muscallunge, Lake Trout and Brook Trout.

Rush Tango Minnow

At your dealers or sent direct post-paid—stamps or money order. "Regular," "Junior," "Weedless Midget" and "S. O. S. Tango" models each \$1

Set of assorted colors and models..... \$4
All models patented, and guaranteed.

J. K. RUSH, S. A. & K. Bldg., Syracuse, N. Y.

*A Wizard for casting.
Swims On Surface with life-like motion. Can be made to wiggle under surface.*

THE INTERNATIONAL Kerosene Gas Burner

*Makes Cooking a Pleasure in Your Home or Camp
No Ashes No Dirt No Wet Wood No Hunting for Fuel*

Just turn a valve, light a match, and presto, you have a hot, concentrated flame. In five minutes you have intense heat right where you want it. Burns ordinary coal oil. So simple in operation a child can use it with absolute safety.

Save time, temper and money; Get a stove that's always at your service.

21 years who is the holder of a valid hunting or trapping license may, and it shall be the duty of a game protector or other peace officer to, humanly destroy a cat at large found hunting or killing any bird protected by law or with a dead bird of any species protected by law in its possession; and no action for damages shall be maintained for such killing."

I would suggest, in view of the fact that some people prize their cats, that a small tax be levied on each cat and that it be compulsory that they have a tag attached that they have to carry during the months of May, June and July, and all cats not having this tag be "open season" for the catapulet, the .22 rifle or other means of destruction. This will protect the house cat or pet belonging to people who care for them and at the same time get rid of a lot of "strays."

There is no doubt that cats are responsible for a large part of the destruction of our feathered friends—go out into the country any day and roam the fields of young grain and verdured pasture and you will see the ——— sneaking through the grass in search of birds—any kind will do—Bobolinks, Orioles, Thrushes, Tanagers, or a Ruby Throated Humming Bird so when it is a question of which shall it be, birds or cats, I would say "a bas Mr. Thomas Cat."

"Old Doc. Hemlock."

As an ardent supporter of *Rod and Gun*, I have read with great interest, a story in the June number written by Mr. F. V. Williams. His remarks, written as they are in story form regarding the habits of the common house cat are only too true.

I consider from my own observations and I have had many chances of proving the statements I make, that the house cat is the worst enemy the birds have and when a cat has learned the habit of climbing trees, to kill the nestlings, to satisfy his cruel instinct, and not necessarily his hunger, (as a well fed cat will still continue the habit) he is fit for nothing, and should be mercifully put out of the way. There is not a question of doubt that our song birds and others are slowly but surely decreasing in numbers, year by year, and I fear no contradiction when I say that the house cat is mainly responsible. as nearly every country house contains a cat, and in many cases two or three and even more, and while the average cat is not a success as a destroyer of rats or mice I would suggest in order to control the indiscriminate breeding of cats, that the Government tax them the same as dogs. And why not? This would not only give the birds a chance, but would help to eliminate the worthless cats which are doubtless in the great majority.

R. M. Thompson.

With all his knowledge, Shakespeare missed the mark when he spoke of the "harmless necessary cat." Harmful and unnecessary would be nearer the truth. Dr. A. K. Fisher, of the United States Biological Survey, reckons that the cats of New York State alone kill three and a half million birds every year; another statistician figures the damage that the cats of the whole country do as more than a hundred million dollars' worth. They also keep down the number of game birds by catching their young, and so interfere greatly with sport. Remedy—abolish the cat.

BIRMINGHAM SMALL ARMS IN CANADA

"With a view to greater expansion in the Canadian field the Birmingham Small Arms Co. Ltd., of Birmingham, England, has opened offices in Montreal at 241 Beaver Hall Hill under the management of Mr. F. E. Fraser, late Captain Royal Air Force.

The B. S. A. will carry a stock of rifles and shot guns in Montreal. The factory are doing their utmost to resume peace time production and expect to make delivery in July of their Bolt Action and Model 12 Target .22 Rifles, as well as B. S. A. Air Rifles. These Rifles should be available in Montreal the latter end of August."

OF INTEREST TO FOX BREEDERS

Now that the heroes of the Expeditionary Force have returned from overseas, renewed interest is being shown in outdoor life. This is particularly true of fox breeding, both for profit and pleasure. The well known firm of fox breeders' supplies, Messrs. Brace, McKay & Co. Ltd. of Summerside, P.E.I. have received numerous enquiries from all parts of Canada regarding fox netting and sundries. This enterprising firm claims to be the largest of its kind in Canada and judging from its high class quality of goods and service, it is not hard to understand the reason for this claim.

MARBLE'S SAFETY AXES

CANADIAN INDIANS ON THE WAR PATH JULY
1ST and 2ND.

Niagara-on-the-Lake Tournament a Brilliant Success.

The sun was slowly sinking like a ball of golden fire into the azure blue of Lake Ontario. It was Dominion Day at Niagara Falls. The Lake and after a day of celebration, all gas still. In the distance a whip-poor-will's plaintive call could be clearly distinguished, but this only accentuated the silence of the stilly eventide. The summer residents and tourists at the Queen's Royal Hotel were sitting in groups of twos and threes on the verandah and around the promenade when suddenly the silence was shattered with a blood curdling yell that thrilled the silent listeners. This was followed in quick succession by others even more blood-curdling — "Whoopieee—Whoopieee-e-e-e-e-e Waugh, Waugh." The audience were astonished to witness the sudden appearance of not one, but a score of wild, wild Indians in full war paint. They followed the lead of their Council of Chiefs and were soon gliding toward their encampment doing the tortuous Snake Dance. The bewildered on-lookers were treated to some real thrills when the braves spied some "pale face squaws" and proceeded to make loving advances in approved Indian fashion.

advance the enlightenment of the uninitiated we might explain that this was annual costume event of the Canadian Indians who each year return to delightful Niagara-on-the-lake to "bust" the clay birds, give the family an outing, and incidentally renew their youth. It was a success from the first "Pull" on July 1st to the last "Broke" on the evening of the 2nd. Beautiful weather greeted the shooters and the unexcelled accommodation of the Queen's Royal Hotel along with the splendid traps and the efficient work of the Secretary, Mr. George H. Cashmore, made a memorable Tournament that will long remain as a pleasing memory with not only the shooters themselves but the fortunate relatives and friends that were in attendance.

The attendance of Indians was not as large as in former years owing to the signing of the Peace terms being celebrated in numerous places. However, any deficiency in numbers was made up by the enthusiasm displayed by the remainder.

The targets were perfect and the shooting was up to the average. In one case however, the appearance of some fair bathers in the foreground caused a slump in the official scores and the shooter in question was reminded of the incident several times during the day.

George Vivian of Toronto, of "Are You a Red Eye?" fame, did some very clever shooting in the doubles. Shooting with his English "barrel over barrel" trap gun he flinched on one bird, pulled over to the other, flinched and then smashed it and finally sighted the first bird and killed it as it was dropping out of sight into Lake Ontario. The spectators showed their approval of this quick work in no uncertain fashion.

When it came to costumes W. Hughes of Toronto, made the other Indians look like palefaces. As one spectator remarked, "Billy Hughes would fool a Hudson Bay factor in that make-up."

"Genial" George Dunk with the splendid Dominion Cartridge Tent for spectators was on hand as usual and like Nelson Long, the target man was in constant demand by the shooters. At the annual meeting the election of officers took place with the following results:

High Chief, Fred W. Watson of Hamilton; Vice High Chief, Walter P. Thompson; High Scribe, George H. Cashmore of Toronto.

In the Henry Butt trophy open to Canadian Indians in costume, Jim Payne of Tillsonburg and H. W. Cooney of Toronto, tied at 48. In the shoot-off Payne succeeded in winning the trophy.

The splendid solid silver trophy presented by the Queen's Royal Hotel to the best five man team was won by Hamilton this year.

S.G. Vance of Tillsonburg, Eastern Canada's representative at the American championships at Chicago this month won the Toronto Cup as winner of the grand aggregate in all regular events breaking 342 out of 350.

Winters, G. J. O'Connor; sitting, left to right, George Easdale, W. J. Corby, H. Graham, W. D. Monk. 3. W. Barnes of Hamilton. 4. "Genial" George Dunk of Toronto. 5. J. A. McRobb of Brantford. 6. Sam Vance and Jim Payne of Tillsonburg. 7. "Heap much braves" in front of tepee after sundown dance. 8. Two of the fair visitors, Miss Watson of Hamilton and Miss Healy of Toronto. 9. George Vivian of Toronto. 10. Walter Thompson of Hamilton and W. Hughes of Toronto.

Handicap Tournament to be held at the South Shore Country Club, Chicago, Ill. August to 15th inclusive. The name is somewhat of a misnomer as there is only one handicap event, that being the Grand American Handicap which will be shot on the closing day. S. G. Vance of Tillsonburg, is the Eastern Canada champion, who along with the winner of the Western Canada championship will officially represent the Dominion. Some fifteen other shooters from Ontario have signified their intention of attending this great Tournament and when one considers S. G. Vance's percentage of .9300, breaking 1116 out of 1200, and Joe Jennings's wonderful score at New York, there is no doubt that the Maple Leaf boys will number with the high guns in each event.

TORONTO EXHIBITION SHOOT

The Canadian National Exhibition Tournament will be held on August 26, 27, 28, 29 on the Exhibition grounds which rank among the best in Canada. This Tournament always meets with wonderful success and according to the shooters that have signified their intention of attending this year, the shoot should be even more popular than ever.

HAMILTON GUN CLUB.

Although the attendance at the Hamilton Gun Club on Saturday afternoon was smaller than usual, on account of the rain, the scores in the Merchandise events ran very close.

In A class M. E. Fletcher set the pace with 24 and won the merchandise prize, while N. Long was right behind him with 23. J. Gomph and E. Harris were tied in third place with 22.

A. Parmenter and H. Smith tied for the lead in B class with 21, but owing to the rain instead of shooting off the tie they slipped the coin and A. Parmenter won the toss. J. H. Newman, W. W. Livingstone and Dr. Greene were next with 20 each.

N. S. Braden and A. Glover shared the honors in C class, with 20 each, and on the toss N. S. Braden was the lucky one. P. Friend was next with 16.

On the afternoon's shooting M. E. Fletcher was high with 24 out of 25. N. Long had a very creditable score, having broken 102 out of 110. M. E. Goodale and E. Harris each broke 64 out of 75.

The scores were:

	Shot at	Broke.
P. Friend	75	53
E. Harris	75	64
J. Gomph	75	61
A. Parmenter	75	54
J. Moyer	75	41
J. Hunter	50	42

J. H. Newman	50	36
N. S. Braden	50	41
W. W. Livingstone	50	38
G. Stroud	75	53
Dr. Greene	75	61
A. Smith	50	30
M. E. Fletcher	25	24

INDIANS DEFEAT HAMILTON.

Hamilton, June 21.—The team race between the Hamilton Gun Club and Canadian Indians for their flag, proved of great interest, and as a result a bumper crowd of shooters and spectators were one hand to witness the contest, which was well worth seeing, as some excellent scores were put up.

Six men were picked from each club, each man shooting at 50 targets and at the finish the Indians had won out with a total of 281, against 276 for Hamilton. For the Indians F. W. Watson and George Cashmore were best, both having broken 49 out of 50; E. Sturt being next with 47. W. Gooderham and G. M. Dunk each tallied 46, while T. Healey got 44.

W. Barnes and Geo. Beattie were high for Hamilton with 48 out of 50 and N. Long was right behind with 47. G. Graham broke 45 out of his 50, while J. Hunter and H. Lennox each got 44.

Geo. Cashmore, of Toronto, had the high average for the afternoon, having hung up the tidy score of 97 out of 100, and W. Barnes with 48 out 50 was next. Geo. Beattie got 71 out of his 75 and W. Gooderham, of Toronto, broke 94 out of 100.

The scores were:

	Shot at.	Broke.
R. Douglas	50	40
N. Long	125	114
M. E. Goodale	100	74

ROD AND GUN MECHANICS.

The winner of the handsome oil painting offered for the best contribution to *Rod and Gun Mechanics* Department from July 1918 to July 1919 will be announced in our next issue. The Department has been left out of the past few issues on account of lack of space but it is hoped that commencing with September the Department will run continuously.

MAKE GERMANY HELP THE BIRDS.

The British Royal Society for the Protection of Birds is behind a movement to make Heligoland, Germany's North Sea island fortress, a permanent bird refuge. Why not? The Allies will see to it that it will be thoroughly dismantled and will no longer menace civilization. In contrast, what more fitting use could be made of this island than to give it to the birds?

FOR SALE, WANT AND EXCHANGE DEPT.

Electric Starting and Lighting

NO car has a better starting and lighting system than that now available to purchasers of Ford Cars. It is a Ford product, built into the motor—

—a positive starter as reliable as the motor itself:

—a powerful lighting system, uniform under all engine speeds.

On the open models—Touring Cars and Runabouts—it is **OPTIONAL EQUIPMENT**.

On closed cars—Sedans and Coupes—it is **STANDARD EQUIPMENT**.

On all models the Ford Standard Magneto also provides ignition independent of the batteries.

See the Ford car with this new equipment.

Ford Runabout \$660; Touring \$690

On open models the Electric Starting and Lighting Equipment is \$100 extra.

Coupe \$975; Sedan \$1175 (closed model prices include Electric Starting and Lighting Equipment).

These prices are F. O. B. Ford, Ont. and do not include the War Tax.

BONNYCASTLE DALE.

Male loon attacking Laddie Jr. and I. The female and the two babies were a few yards away watching him. He always swerved in a curve, coming within about a half a canoe's length his great ruby eyes stuck out like lanterns and his green head and neck puffed out with rage.

Our Old Elusive Friend the Black Duck

Written and Illustrated by BONNYCASTLE DALE

WE have tried all our lives to classify this big sly duck. It breeds so true to form that we long ago gave up calling it an offshoot from the Mallard. Yes! It is called the Black Mallard, but for what reason? Did you ever note a female Black Duck, or a male Black Duck in the flock passing overhead—No!—Why? Because, it is the only duck of the various thirty odd ducks that nest in Canada that has no sex distinguishing marks. Many writers say you can tell the male from the female by the bill being unclouded. Others by the general look of the bird, others again—and these come nearest being correct—by the notes and calls. Truly the female is usually the garrulous one, the male generally using only one or two guttural “quacks,” but how about the growing youngsters? No one can tell the sexes by the calls then. There is only one way to surely tell the male from the female in this spurious breed—dissect them.

Just by accident a flood of light was thrown upon the probable ancestry of this rare bird, a bird without the male's gaudy plumage in the mating season. In the Southern States they have been bothered by the Northern flight of the Mallard; and also by the Southern flight of the Florida Duck—thus leaving many of these states without Mallards in summertime. To overcome this they made the experiment of breeding the

Mallard with the Florida; and the odd result was a spurious duck; without the full markings of either parent; but with some of each—AND THE MALE MARKED EXACTLY LIKE THE FEMALE.

Only in imagination can we see the parents of the Black Duck, without doubt the Mallard was one—and I am utterly at sea as to the other. The main breeding grounds of this Black Mallard seem to be in Labrador, extending through all the settled parts of Quebec and Ontario into parts of the Prairie Provinces; but not crossing the Rockies—as I have shot in a great many places along the Canadian Pacific R. R. on the Coast and have never seen a Black Mallard—but remember it will be only a few years before it will find its way down the rivers that empty into the Pacific Ocean; as the Canvas Backs and the Red-heads have within my memory.

It has been our supreme delight to hunt this wary chap in most of his widely scattered grounds. This is the old time “Black English Duck” of Florida long before our time. “Black Mallard” you will hear it called all through the tier of Central and Western States, but “Dusky Duck,” “Dusky Mallard,” and “Black Duck” are the prevailing names in the North. Western writers seem to ignore it; or to call it “The Mottled Duck.” In fact if you look it up you will find modern writers ignore it as too difficult to classify—

Leg amputated, bird ready to be released

Hornaday in *The American Natural History* does not even mention this bird although its head is pictured—the second most widely distributed in America—of course the daddy of all our domestic ducks—the Mallard—comes first.

Again some writers classify the black Duck as divided into obscure (dusky) and rubripes (red legged). All I can say on this point is—that among the thousands I have observed, or killed for the camp table, the legs were indiscriminately buffy, yellow, olive green, reddish yellow, and quite red, looking to me as if in the same family several of the youngsters had differently coloured stockings. Men familiar with the bird in Labrador do not dwell upon its having particularly red legs. I have wondered if the water they puddle around in could cause this odd red shade. I know of certain mineral pools that might do this—but this is only conjecture—Another thing we have tried to study all our lives is,—do the wild fowl drive out, or ignore, or illtreat injured wild fowl?

I have seen flocks of lordly Canvasbacks and Redheads drive out Surf Ducks, these were uninjured birds, they drove them out in a

regular run-the-gauntlet-style, each group pecking and flapping at the passing flock of surviving surfs. I have always found the injured alone along the bogs and in the marshes, especially when they were wingtipped, or with legs broken. And, to our great astonishment we find every fall, numbers of Redheads and a few Canvasbacks moping and hiding along the edges of the bog. If we by mistake knock one of these down when it jumps we pick up a perfect skeleton, and as these come from the early regular migration southward of these birds, the Indians (Mississaguas of Rice Lake) call these "Marsh Redheads" or "consumptives."

I have found numbers of injured birds in the great flocks that raft in the centre of the lake; but in every case these are bodystruck birds; making it impossible for the flock to distinguish them as cripples and drive them away.

Again, each Spring, we find numbers of Whistlewings, many more males than females, slowly dying all along the shores of Rice Lake. With these we find a lesser number of Bluebills—these I place in the natural death rate column, but we do marvel at the great majority of males; can this be caused by a greater number of females being killed on the great migration? They are more trustful and not as wary as the males.

My assistant, Laddie Jr, often brings me in these poor dying things, never can we get them to feed, just a drink of water is all they crave, and the pallid bills and inside of the mouths tell me of senility. A little joke hinges here. The boy paddled away one day on *Natural History* thoughts intent, aiming to pick up and bring in to me anything he could catch, so he sneaked silently along the edges of the Indian Reservation pursuing and catching anything he could come up with. Later he saw a little motor launch being steered along in the path he had come. With remarkable persistency it followed every turn he took and at last, with a vicious "put, put, put" of the engine and a quick flashing of the oars, it

started right across a narrow bay after him. The lad kept on about his business and just wondered. The two men were making an awful spurt and finally arrived breathless at the stern of Laddie's wandering canoe.

Now as both the lad and I are out in all seasons and not any too careful of just what sweaters or hunting clothes we throw on, and as the Spring Sun had given us both an excellent—guaranteed to wash Ojibway tint—the Game Warden with the water disturber at his stern, naturally took the youngster as a member in full standing of the Indian tribe and consequently a breaker of the fish laws; "Got any fish?" he thundered. Of course the lad smiled, he knew we always obey all the game laws—just then the eagle eye of the warden alighted on the lad's Natural history collection—and he was a bit puzzled; there were the wild ducks all right but they were all alive; sitting contentedly in the bow—and never a gun in sight. Soon I saw the little rowboat "put-put-put" away from Laddie, and the boy had a great laugh when he got back to camp. I sent a nice note out to the warden; they all have instructions not to interfere with my work. You see we never take out a collector's permit; as we always return things to their native element, in as good or better shape than we received them—whereby hangs a tale.

My assistant did a bit of trapping in the spring about our mud-marsh island and was unfortunate, as are all the trappers, in catching a few poor birds and wee animals who will get caught in the cruel traps. No! I can propose no remedy for this, and I have tried.

"Oh! I've caught a poor black duck!" Laddie, Jr., called out one day as he came into camp. "And I've broken its poor leg," he lamented.

Together we examined the trembling bird—its clear big brown eyes searched every movement. I handed the lad the knife and nodded, nothing for it but amputation and as I am teaching him to do all these things unaided he turned to the canoe and I seized the camera. He trussed

You're free—go! Black duck leaving there in a hurry.

his bird correctly and a few merciful passes and the mangled leg was severed, and a swift immersion in the cold water stopped the bleeding, then he held it up—and I snapped a bit too soon (I can catch a bird between his hands and the water with the focal-plane shutter) the bird dived right beneath the surface from his hands. Remember the big fool black ducks have at times to live on the discarded fragments from the flocks of diving ducks—because it cannot dive, at least it very rarely does, but wound one and it instantly becomes a past master in the art of diving.

This was in April 1918. All the spring and summer months we were busy with our cameras and our war gardens, so it was not until the September shooting that we returned to our tight little isle in the Indian Reservation. Many the glorious "shot" we saw arise out of the wild rice and snapped it with our fast cameras instead of with our guns. The intense pleasure of the "sneak" up to birds is just as thrilling as it is if we were going to kill instead of picture them, and I think if my camera was sentient it would say

■ The female of the black duck with only one leg—see the broken bone sticking up.

"shoot" when I throw it up to take a picture, as really I do feel as if it were the gun sometimes. You see the lad always has his decoys set off the point of Migration Camp and even when he is eating he can get his pictures, for a string runs from the trigger of the concealed camera, fifty yards distant; to our frugal table. So one day after the shooting season had opened I left him on the point and went back to our own little private pondhole behind the island. The wind blew towards me and I crept to the edge unheard and unseen—Yes! there was one! A big black duck sunning itself on the far edge

of the pond. Slowly I raised myself erect, not fast enough though as the bird was in the air before I was up, but I centered it and down it fell. I retrieved it in the "sieve," that we keep on the pond's edge and fondly call a canoe, and walked back proudly towards Laddie Jr.

I made a motion to change my grip on the one leg of the bird to the other and—dropped it; there was no other. Then I sat down and examined that bird. It had only one leg. I thought it might be the bird we had caught in the trap five months ago, but there are lots of other men who mercifully amputate hanging legs of trapped birds; so I continued my way towards camp undecided to its identity.

"I heard you shoot," called the lad, "what did you get?"

"A friend of yours I think; come and see." Together we examined that bird—

"Yes, it's the very same one. See on the other foot, in the web, is the gash where my knife slipped and knicked it," said the boy.

Satisfied as to its identity he stepped on the tiny wharf where we had pictured the bird in April, when the ice was floating in huge fields all about the lake and again I snapped it. I am sorry I did not get better focus, as he stuck the stump of the leg up in the air.

Just one other thought—did the semi-crippled condition of that bird prevent its mating, or rather prevent it resuming its mate, as this breed is mated in April. Its solitary position, especially after several days of intense firing all about the reservation leads me think that even birds as slightly crippled as this one are abandoned and shunned by the healthy members of the flock.

Mirror Duck Blinds

EDWARD T. MARTIN

AS the duck shooting season grows old, and the deep water birds arrive from the North and begin to show on the bays and fresh water

lakes, the question of blinds becomes an important one.

Where there is a six or eight foot rise and fall of tide, the usual form

of timber blind seems hard to improve on. Yet it is of a kind that the ducks soon learn to avoid and shy from—the motion of the skiff in the lower section of the blind attracting their notice, and its pounding against the frame work serving to alarm them.

A floating blind is too unsteady in a sea-way and may break from its moorings and turn up missing when most needed.

A fairly good blind of this type can be made out of old water boilers—the galvanized iron cylinders used to heat water with a kitchen range, for household purposes. They are of the right length when set crosswise to support the timbers of a platform.

When put to the use for which they were made, if a leak develops no way has yet been found to make repairs sufficiently strong to stand the pressure, but as a float for use in a duck blind the leaks can be plugged so that the cylinders, four or five to a blind, will answer admirably, forming, with the platform in place, a regular life craft on which a brush blind can be built roomy enough to conceal both the hunter and his skiff.

Of course the correct way of bay shooting is from a battery, such as is used by gunners on the Chesapeake—a coffin-like affair, protected by wings from the wash of the waves, in which a gunner lies flat and shoots as the ducks work to his decoys.

A contrivance of this sort has rarely been seen on the U.S. Coast and never so far as I know in Canadian waters.

Years ago, nothing of the kind was needed to get plenty of ducks, and later, it has not paid to go to so much trouble and expense to kill the twenty-five which is about the maximum permitted anywhere.

The record for one gunner in a day, shooting from a battery, was made in Eastern Maryland, and was 500 ducks, mostly canvasbacks. These birds were selling then at five and six dollars the pair, and brought the gunner from eighteen to twenty-four dollars a dozen net—a fair day's work. But the pounding—it was in the days of black powder—brought

on congestion of the brain, which came near proving fatal to the shooter.

In large lakes, or other bodies of water that are tideless, a barrel staked firmly down is used, although many prefer a box, as affording the gunner more room to handle himself. The box should be made of half inch pine lumber, with corner posts of two by four scantling and a bottom of inch boards. To make it water tight, all joints should be white leaded, then canvas—the inside of which also has been painted with white lead—tacked over the sides and bottom below the water line. This done, zinc is nailed over the canvas, and every joint soldered, as in a bathtub.

If the work is thoroughly done, this makes a box that water cannot penetrate, but in certain places along the Gulf of Mexico, a small amount of quicksand will force its way through.

For a large man the best sized box is thirty-six inches wide, long and deep, of which twelve inches is left above the water line, this part hung with "drift," such as seaweed, or leaves of wild celery. It is astonishing how much sea such a box will stand, the real danger being that the stakes will pull up and the box roll over and dump the gunner out.

Several experiments have been made with blinds covered with mirrors. That is, boxes, all parts of which above water are masked by mirrors.

Under certain conditions this looking-glass business is great stuff.

For example, stake a mirror blind half a mile from shore, in any body of water where ducks are feeding, and, sooner or later, curiosity will get the better of the webfoots. From all sides they will swim to see what that shining thing is. When they come near enough, each will see its own reflection in the glass, and hurry the more to see what that stranger is doing there.

They will keep coming until, either the man in the box raises his head and frightens them away, or makes a pot shot with which he bags a dozen or more. Then his tender shoves off from shore, picks up the

dead, chases the cripples, and in two or three hours is called on to do the same thing over again.

On flight shooting, the glass does not work as well. The glitter and shine of the glass which, when the ducks are swimming, arouses curiosity, incites fear—or it may be caution—when they are flying. They circle, look down, see the man and go the other way.

Set on a sand bar on a cloudy day, when there is no sparkling water to be reflected, almost perfect results are obtained. Geese, ducks, pelicans, come within easy range, not quickening their flight until the gunner arises to shoot—then acting uncertain, as if they could not believe what they saw, and that a man was really there.

A glass blind is very effective late in the season after the ducks have all

become educated. They do not shy from it as from an ordinary bay blind. It is a new one on them, and however skittish they may act when flying over, they certainly will swim in to admire themselves in the mirrors. Females only? No, sir! The drakes are just as vain as the ducks—perhaps more so. Just as anxious to prink and preen before a looking-glass as their better halves. They travel on their good looks, and as anxious to appear well as the dudes and dandies of the human race.

In Canadian lakes though when there is snow around the banks and ice on the water, a box painted white inside and out is as effective as a looking glass blind, perhaps even more so. I never used one but once, then nothing could have answered better. The water fowl showed absolutely no fear for they imagined it to be a cake of ice.

A Bear Hunt in Town

RAMROD

THE summer was waning. The sun cast longer shadows through the woods. The maze of trees was once more resplendent with a wealth of glorious color and the beautiful Indian summer air was laden with the perfume of the wild flowers. The ducks would soon be leaving their northern breeding grounds for more comfortable quarters in the south, long lines of Canada geese would soon honk their noisy way across the sky. I sat and pondered on the God-blessedness of it all, the sun was nearing its gorgeous setting, the maples standing out against the darkening back ground of the forest in a lavish blaze of glory, making an indescribable scene of beauty.

Berry pickers had reaped a rich harvest, there being an unusual abundance of the luscious fruit everywhere, and many were the happy jaunts we took out on to the rocky ledges and the great open spaces, both for the berries and for the added strength

that follows the life of the great outdoors. There had been another visitor to the berry patches that particular summer in the shape of a large black bear. One day the women and children came rushing back to town minus berries and pails, but plus a good case of nerves; for days no one would venture near the bush, and a little while later a lone angler was nearly scared stiff upon awakening from an afternoon nap in the welcome shade of some bushes, where he had gone for a rest up, to see bruin sitting upon his haunches calmly giving him the "once over" with his little beady eyes and not fifty feet distant. The angler, not wishing for a close-up acquaintance left his belongings behind, arriving in town in record time. The news soon spread and my old hunting pard and myself took sundry strolls on the off chance of getting a shot at his bearship, but better prepared to give him an appropriate welcome, or as my pard would say, "well heeled." We always re-

turned with the same hard luck story, nothing doing.

"Harry, Har-r-ree. Listen."

"Who's that? Well for the land's sake, it's Bill. Where did you spring from?"

"Come on, get your gun, there's a bear down in the diamond."

"There's a which?"

"A bear down in the diamond. Honest to goodness, a jim dandy."

"Say now William, you cut that out, don't be throwing any of that stuff around here. I have hunted your bears long enough and I thought we had passed the kid stage, but you would wrestle with the chin whiskers of a bobcat himself to start a breeze. Do be quiet now and come on in."

"No, honest, listen—mind that big black devil that's been around Gull's Lake all summer. Mind the one that drove the women out'n the berry patch down past the west arm and mussed things up most almighty bad in Ted Taylor's farm yard. Same hyena, and he is down in the diamond right now wid a coat on him that would cover the floor of Jake Lawson's shanty. Just before "knock off" time two of the boys came running down the track to beat two of a kind, all excited like, and I gathers the information that old long toes had been some disturbed at his old tricks and had took to the diamond. 'We're beating it for our Tirty-Tirty's,' they says, 'and old Jake is a holding on 'im in till we gets back?' Wid that I nips on the wheel and beats it home and I ain't been more'n three minutes arriving. She can't get away for they'll have her hemmed in on all sides, for I seen two or three more boys on the way down and they mean business. Come on now, I've got my old .32 Special and we can make it down the track in no time. You'll do just as you are, get your gun and come on."

"I'd like awfully well to go, Bill," I answered, "but—"

"Go and see anyway," said the wife, "you can be back before dark anyhow."

That settled it. I lifted the .30-30 Winchester out of the cabinet, pock-

eted a box of shells, grabbed a pull-through to take the grease out of the barrel and we were off. As a matter of fact I was highly elated at such a chance to try out my rifle at something worth while. She was brand new and I had her beautifully sighted up—Lyman rear peep, folding middle and ivory bead front. I had taken great care of her at target during the summer, and when I had passed her as being O.K., could hit an object the size of an orange five times out of six at fifty yards offhand. Twenty-six inch octagon barrel with full magazine—balance—well, when I put her up I verily believe I could hit a squirrel in the head at the aboye mentioned distance. What a chance! Old Bruin at last, and a sure thing.

Let's take the track," remarked Bill.

We took it. We had no more than started when two more of the boys with guns at trail showed up just ahead, and a kid fell in behind with what looked like a Stevens Favorite very much the worse for wear.

"Hello, sonny, you going bear-hunting too?" I asked him.

"You bet," he replied, grinning all over his face.

We were soon approaching the scene of action and Bill had the whole program mapped out to a finish even down to skinning.

"I'll take the corner down by that clump of birches," he remarked, "you had better stick to the track this end, and don't be scattering too far away for he's a mighty slippery customer, I'm telling you."

"Yes," volunteered the kid, "and she's got cubs wid her!"

"Cubs?" I asked.

"Yes, cubs, two of them," replied the kid. "Young Taylor over to the farm seen 'em go in there this afternoon."

"Gosh, darn it! Bill, hear that. Holy doodle, three at a clip," and I stepped out a bit brisker.

"Didn't I tell you?" said Bill, "I knowed we would get her before fall, she got too gol-darned used to the place to leave it, and she's as bold as brass."

"Look out," cried the kid at this

juncture, but it was too late and I turned just in time to see Bill tobogganning down the steep side of the track, hanging on to his beloved .32 Special for all the world as if his life depended on it. Sometimes he was sitting up, and sometimes he was sitting down. Mostly down. He reached the bottom wrong side up and lodged against a stout wire fence. Suffering Smokestacks, d - - m, or something infinitely worse sifted upwards through a clump of grass, and I had to sit down on the track to keep my ribs in their right position. I nearly died, it hurt so, and turning round I noticed a grin on the kid's face much like a chink wears when he sells you a meal ticket.

"What's the matter with your face sonny?" asked Bill between puffs, kind of peeved like, when he had reached the top, and although the kid didn't answer I could tell by the look on his face that he was suffering some. However, the tie Bill had kicked was still in the same place so there was no harm done.

"Don't you think she is likely to be ugly with cubs?" I asked between gasps.

"Ugly—nix—" said Bill, "and you with a new .30-30 all dollied up with peeps fore and aft. No danger, you could hold for her ear and get her every time." And somehow I felt more confident. We were now in sight of the diamond. A large square of birches, evergreens, and shrubs of all descriptions, it lay in a natural pocket between the hills, guarded on two sides by the railroad track and on the other sides with a long sloping hill, bare of everything but loose slide rock and an old woods road. By the look of things when we arrived there was going to be some mighty interesting happenings in a few minutes, and somehow the thirty odd dollars I had sunk in my new .30-30 did not seem so much after all. Gun barrels glinted in the sunlight here and there as some distant hunter changed his position, and I thought to myself we are only just in time to get a look in. And supposing the bear took a notion to make a break

at the other end. But I quit supposing for just at that moment Bill yelled out to inform me that two guns had gone in the further end and were working our way.

"And keep your eyes skinned, and don't get scared," he cautioned.

I opened the breech of my rifle for the second or third time, I don't remember which, to be sure that everything was in readiness, and backed up against a telephone pole to steady my hold, (or was it my knees). Occasionally we could hear a stick break sharply, and sometimes could make out the progress of the hunters by the waving of the bushes, again we could hear a swish as of the heavy bodies of the bears squeezing through the brush. Crack again, and smash—smash. They were coming all-right. Three parts of the diamond had now been covered, cheers and advice began to drift down the breeze to where we had taken our stand and the suspense was awful, minutes seemed like hours and I wondered again for the two hundredth time where the bears would choose to make a break for it. Suddenly pandemonium broke loose, my hair began to stiffen, my heart was within two inches of my head, and I faintly heard Bill's warning that they were coming my way. As if I didn't know it. I saw a splash of black fur pass like a flash between the shrubs. Yells and cheers now sounded on all sides, the smashing grew fierce, and every now and then a choice exclamation greeted our ears as some eager hunter took an undesirable header over a twisted root. Another fifty yards—and then—now here they come. I could see the bushes being jerked violently aside, I remember making frantic efforts to keep my gun muzzle from wobbling and with a half whispered admonition to myself to do my durndest, I cocked the hammer, and out rushed a large black retriever and a little cocker spaniel.

We scarcely spoke going home. My heart was too full for words. Bill sneaked in the back way, and as I neared the steps of my own little

shanty I heard the missus singing something that sounded like this.

"Oh, a hunter's life is the life for me
In the woodland aisles so wild and free
So we'll hunt the bear from his mountain lair,
And tan his hide in the morning."

I carefully laid my .30-30 in a corner of the outer kitchen. For the time being I told myself, "It's too warm to go in just yet."

As I reached the bottom of the steps I could hear the second stanza as

it floated dreamily through an open window into the quiet evening air, and I wondered why the missus persisted in singing such fool-songs.

"For the man I love is a hunter bold,
A stalwart son of the North Countree,
With trophies rare and a heart of gold
He'll return to his bride in the morning."

It was many moons after that sad night before Bill and me talked bear again.

"Joan of Arc stood with arms akimbo"

Three Women and Three Men

Being the Story of a Day's Fishing in Timagami

M. PARKINSON

THEY knew they couldn't fish. Women never could catch fish. Then the thought of stringing a wriggling worm on a hook, and pulling a flopping fish from a cruel barb; no, it was altogether too terrible!

The three of them had been at Walsh's Wigwam for a week. This is the way they talked when they came, but day after day as they saw the laughing tourists come in at night with their catches of trout, blackbass, and pickerel, they became more and more interested in fish and

fishing. At last they began to talk about trying it themselves.

So one evening on the verandah of the Hudson's Bay Store it was settled that we should start in the morning. Oderick Perron, the six-foot-two French Canadian transportation king of Timagami, was to take us up the Obabika Bay in his swift gasoline launch, the *St. Lawrence*.

Then there was the selection of the canoes. The party was to consist of six. Three mere men were to go along to see that some big gray trout did not pull one of the party out of

"The beauties of Obabika opened to our delighted eyes"

the canoe into the lake. In a trice we were all down at the wharf. The sun was just setting. Timagami lay a sheet of burnished gold at our feet. Mr. Fraser, the obliging Hudson's Bay Factor, soon had three Chestnut canoes picked out, and the necessary supplies and tackle for a day's fishing selected. The women became interested at once. She who had been nicknamed "Joan Of Arc," because of her true blue French patriotism as expressed even when the war news had been the most depressing, stood on the edge of the wharf, arms akimbo criticising every minutest detail.

At last all was arranged. We were to start at eight next morning. Then we sat on the verandah at the Wigwam and discussed the morrow's programme down to the last detail. Oderick was consulted as to such trifles as tackle and bait and concurred in the decisions we had made for the same.

Soon all had retired to sleep and mayhap to dream of the morrow. Would it be a fine day? Would the fish bite? And all such torturing problems swam through our brains. But with the morning light one of these problems at least was favorably solved. It was a glorious morning. From our bedroom window we could see the blue breast of Timagami, studded with its innumerable islets of emerald green, just stirred with a

gentle breeze, which sighed through the open shutters and touched our cheek with cool fingers which brought inspiration and exhilaration of spirit and senses. A loud "Hurrah! It's a grand day!" rang through the hallways; and as if by sudden appointment the dauntless six were ready for the fray.

Breakfast was soon negotiated, and the stroke of eight found us at the wharfside. Oderick was there before us. Already he had the *St. Lawrence* primed and ready. One sweep of his powerful arm and the crank put motion into the fly-wheel, the six cylinders took up their rhythmic pulsations, the propeller churned the water at the stern, the *St. Lawrence* left the wharf-side, turned her prow to the north, and gathering impulse at every throb she was soon plunging her way through the pellucid waters.

It was a scene fit for the Gods. The blue sky, unflecked with clouds; the bluer lake; the deep green of the pine and fir clad islands; and the magic vista of the North West Arm spread out before us, combined to form a picture which we shall never forget. No one talked. All fell to thinking, and to watching the tiny globules of water, thrown off from the bow wave, as they scurried, rolling over the placid and unbroken surface of the waters on either side.

Soon the end of the Arm was reached. Nothing appeared before us but

pine clad, receding hillsides. Where was the Obabika Bay in which we were to catch the fish? Onward raced the *St. Lawrence*. Would Oderick dash her on the rocks now but a few hundred yards ahead? One sweep to the left, and there hidden hitherto by a jutting point lay the opening. The *St. Lawrence* sped through the jaws of this watery trap, great rocks showing their angry noses on either side only a few feet away. And as if by magic, the beauties of Obabika Bay opened to our delighted eyes.

Six miles farther on the *St. Lawrence* sped with opened throttle and a terrible roar, which awakened the echoes far and near. She swung around a corner, the engine stopped. Oderick cast out the anchor and we were at the end of our journey.

The scene was superb. The Bay was narrow and sinuous. A myriad of islands broke its continuity, and sat like Emeralds on its blue breast. All was still. The harsh rattle of a Belted Kingfisher as he winged from point to point was the only sound to break the silence. "Joan Of Arc" stood in the launch, and as her eye roamed over the scene, she slowly chanted.

"Crystal Timagami, Wasacsigami,

Low waves that beat on thy shadowy shore,
North of the Nipissing, up the Timiskaming,

We will come back and sing you encore;
Back to the wilds again show me the way,

Make me a child again, just for a day."

And the man we had christened "Governor" expanded his chest, took in a long drawn breath of the balsamic air, drew himself up to a commanding posture, and in a dramatic tone spat out, "Say, people, I now realize the meaning of that very wise and very ancient saw,

"It is not all of fishing to fish."

The canoes were drawn up alongside in a jiffy. Each Darby had his Joan, and two by two we slipped away from the *St. Lawrence*, each pair comfortably stowed in a H. B. C. canvas-covered Chestnut. There is no steed to match the canoe. The champing bit, and jingling bridle makes no music like the rhythmic stroke and dip, dip of the paddle.

There is no other motion to compare with the glide, glide of this forest and lakeland water sprite.

The hooks were baited. The men took the paddles. The women dropped their guilty lures into the crystal depths, for a few minutes all was still. The third canoe uneasily changed its position. The "Governor" who was in charge put its bow along side a great tree which had long ago fallen into the water and whose barkless limbs were now shining down some twenty feet below the surface. This movement brought "Joan Of Arc's" hook in the neighborhood of the fallen tree. Almost instantly came a piercing scream. Something had happened away down there where the naked limbs met the bottom. "Joan's" reel was singing a merry tune. Then came instructions from the "Governor." Under his direction the fish was played as it dashed hither and thither in frantic attempts to free itself from this unexplained entanglement. "Easy now," yelled the "Governor," "You've got him hooked all right, what you must be careful of is not to let him break your line." "Joan" seemed cowed. This was a new experience. She did not feel herself master of the situation. Her face settled down from a picture of excitement to one of desperate determination. She obeyed implicitly. Little by little the line was restored to the reel. All at once the fish broke the water, and somersaulted into the air, a flying leap of a moment's duration.

"By hokey," yelled the "Governor," "a black bass, and a beauty." Soon the fish was alongside. The landing net was ready. One swift sweep of the "Governor's" arm and the quarry lay flopping in the bottom of the canoe.

"Let me see him!" "Let me see him," yelled "Joan." The other canoes were soon alongside. There he lay, a real small-mouthed black bass (*Misropterus Dolomiei*). Many were the guesses at his weight, but all agreed it must be over three pounds.

Now the fishing began in earnest. A glad cry first from one canoe then

from another told of strikes hither and yon.

"Didn't I tell you we could catch fish," cried out "Joan," despite her protestations of a week before."

It was not long before a stentorian shout from Oderick on a near-by island told us lunch was ready. Some of the bass had been transferred to him earlier in the day and now we found them browned and sizzling in the boiling Crisco, done to a turn. Words would fail to tell of that noon-day meal on the flat rock, of the heaps of bread and butter, of the piles of boiled potatoes steaming hot,

"There we stood in the glow of the evening, the fish dangling and shining in the sunlight."

of the stacks of fried bass, fresh from the bubbling fat, of the olives and the pickles, and of the voracious appetites which made the provisions disappear as if by magic. All good things must come to an end, soon the meal was over and Oderick was washing knives, forks and tin plates in the lake.

The "Governor" proposed that we men should have a try at the fishing. So we were quickly in the canoes again, each fair maiden at a paddle. Before five P.M. we were all weary of

fishing and the cry for home came.

Then there was the ride home in the launch. The pleasures of the morning were repeated. The western sun shed a golden radiance over tortuous channel, green islet and distant hillside. Everyone confessed to having spent a perfect day.

The wharf at Bear Island was reached. The fish were brought ashore. There they lay, 60 fine black bass and pickerel, a confused heap on the grass.

"We must have a picture," said "Joan," "Folks at home will never believe our story, if we have no photo to back up the tale."

So a long inch and a quarter steam pipe was requisitioned. Oderick and the "Governor" soon had the fish strung on this pipe and the march to the Wigwam began. The "Governor" led the way on the end of the pipe. To support it a stout stick was crossed beneath in the middle, with Oderick in his shirt sleeves bearing one end. Halfway up from the wharf a halt was called to photograph Oderick, the fish, and the dauntless six. There we stood in the glow of the evening, "Joan" still in her white dress of the evening before, the fish dangling and shining in the sunlight.

Oderick was still not satisfied.

"By Gar," he said, "Fine catch, we photograph them again."

So when we reached the Wigwam the fish were suspended in front of the verandah and with Oderick and the six standing in the rear the camera again registered the result of our day's fishing in Timagami.

Here the writer must leave his readers, hoping that in the summer of 1919 he may have the opportunity of showing at least some of them the marvels of dear old Timagami.

COMMERCIAL HISTORY OF GOLDEN SEAL

Golden seal was commonly used by the Indians and early settlers of eastern North America as a remedy for sore mouth and inflamed eyes, and also as a bitter tonic in stomach and liver troubles, but there was

little commercial demand for this root until 1860, since which time its use has become world-wide, though by far greater quantity of the crude drug, both wild and cultivated, is consumed in this country.—T.H.H.

F. V. WILLIAMS

The Scaup ducks, of which there are two species, big and little; bluebills, as they are often called by the gunners. The real or larger Scaup has a length of from eighteen to twenty inches and a wing spread of from thirty-two to thirty-five inches.

In the lesser Scaup the male's head is inclined to a purplish gloss, rather than the green tint which marks the larger fowl, and the wavy markings on the flanks are more distinct and more numerous on the lesser Scaup.

The smaller fowl never reaches, according to the best authorities, a length of more than eighteen inches, generally about sixteen to seventeen and a half, with the female less than seventeen, with a wing spread of from twenty-nine to thirty-one inches.

The females of the two species are almost identical, although one is much larger than the other.

A fair description would be a duck,—the male with head, neck and front of body a deep black, glossed in the one fowl with greenish and in the other purplish tints, giving a beautiful effect. The bill is broad and flat, and has a hooked "nail" and is of a slate blue

or bluish gray, and at the end is decidedly wider than at the base. Eyes are bright yellow; wing coverts and scapulars, back and lower belly, transversely waved with black and white. Rump, lower back, tail, and tail coverts black. Belly white, and flank feathers or primaries brownish black. The feet are dull blue.

The female scaup has white feathers around the base of its bill. The bill and feet are the same as the male but generally darker and where the male is black in plumage the female is a deep snuff-brown, beginning with the head. The "canvas-back" markings are much subdued in the female and in some places entirely absent.

These fowl are found on both the Atlantic and Pacific Coasts and also in the interior Provinces and States, having as wide a range as most of our Canvas-back, etc.

THE two "greenhorns" sat in the dining room of the "Central House" and looked gloomily out at the British Columbia rain that was coming down as though

it never intended letting up. One proposed going "up to the room," to talk it over, and they straightway did that very thing.

Talk about your "Gloomy Gusses" and "Lonesome Lukes" they had nothing on this pair. About 1000 miles from home, no work, no money, and no acquaintances. "Flat broke" ha! ha! great stuff. Well, something had to be done and that something at once. Hotel bills could not be paid with empty purses and between the two they possessed the magnificent sum of \$12.75, this to board and lodge two husky guys with healthy appetites, until something turned up. "Ever batch it?" queried one. "I never did" came the retort. "Well, down on the waterfront there are some "cabins," they call them up here and they rent mighty reasonable. There's a cook-stove, bed, table and a couple of chairs in each and the young fellow I was talking with said if I cared to come down and rent one that I could use his boat and go out and get all the fish I could eat and if we had time he'd take me out after ducks." "You've got your old gun and we've got blankets enough for bedding, what say if we go?" And as there was no other alternative the two "Lonesome Lukes" went down to the aforesaid waterfront and rented a "cabin."

The "cabin" consisted of one room—a large one, furnished as has been stated above, but the part that appealed to one of the "pair" was that this cabin was practically "on the water" at least the tide came in and flowed directly underneath the floor at times of high water, the cabin being built on "blocks" above the reach of the tide water.

At one side of the cabin there was a goodly sized stream of fresh water that flowed into the harbor, and about the second morning the two were in their new quarters, they gazed out of the end window at a "raft" of "Bluebills" diving in toward the cabin. They sat, these two fellows and watched the ducks come in to within twenty-five yards or thereabouts of their abode and then swim

leisurely past on up the little stream and out of sight.

"Gee, if I had a few loaded shells, hey?" Don't worry, you'll get 'em; ole top, we're both going to get a job and we sure will have some sport with these ducks, then, wait-and see" answered his companion.

Next morning there was but one of the party of two left "at home." the one having gone up town early to look after a prospective job. The breakfast dishes had been all put away and the "batcher" was sitting gazing out of the window at the boat moored not three feet away, to the shed adjoining the cabin. It was a strange craft to his eyes, accustomed to looking at Eastern canoes and boats. This one had been a "dugout" canoe, once upon a time. There had been about six inches added to each gunwhale and locks built thereon and as a result it made a rather presentable-looking rowboat. A commotion outside caused the inmate of the cabin to glance toward the harbor and there about one hundred yards out was a large flock of "bluebills" settling into the water, a few preliminary dives and a flapping of wings and they started to swim steadily inshore diving as they came, abreast the window and past it, and on up out of sight beyond the corner of the old shed they swam, and scarcely had the last one disappeared from view when there was the "Bang!" of a shotgun, followed quickly by a second report and the flock came like so many black headed comets hurtling out of the stream toward the harbor leaving two of their number drifting along with the current.

The watcher saw them drift farther and farther out and all the stories he had heard about the gunners thereabouts shooting nothing but mallards, geese, etc., for their own use, came to his mind. It was the work of a moment to reach out of the window, pull the boat in, "flop" into it and taking the oars already at hand, pull out after the drifting ducks. Say, some feed, wouldn't it be a surprise to his partner. The fellow that had shot these "bluebills" had evi-

dently gone on down town after firing at the ducks from the bridge across the stream where they had been feeding.

The fellow in the boat picked up the first duck, laid it in the bottom of his craft and rowed to the second one and had just lifted it out of the water when he heard some one yell "Hey, where are you going with my ducks?" Looking shorewards he beheld a shooting punt, being rowed toward him by a very excited young man. Talk about the small boy caught with his finger in the jam-pot, well, that was a mild sensation compared to the way the fellow with the ducks felt as he handed over the pair of fowl. "Cheap" is a mild word and although he tried to explain why

he happened to go after them, he saw the look of incredulity on the other's face, which gave way to a look of amusement as he saw the evident sincerity of the speaker's actions.

It was a few days afterward that the man who rented the cabins came round to the boy's place and told, between spasms of laughter, how the newcomers had been deceived by the stories told "round the cabins" in the evening by the fellows living in the neighborhood, that they would not eat "bluebills" as there was so many better ducks to be had. eh? The joke was on the fellow who picked up the ducks, of course, and although he still laughs about it, he will never forget the first "bluebills" he saw shot.

Some Boyhood Experiences

JOHN DOWSWELL

The following little history is of a boy whom I have known intimately for more than fifty years. Our parents' farms adjoined and we grew up as brothers. This chum was a born hunter like Esau of old. One day he came over to show me a cannon he had made out of a piece of alder bush. There were wheels on it and it was certainly some cannon. He suggested loading and trying at a mark. Accordingly he put in a thimbleful of powder, wadding it well. Not having a ball I loaned him my glass alley. To be sure that I would not lose the alley I went into the milk house and got a new milk pail, putting the mark inside on the bottom. I then felt sure of the alley. Everything ready he touched a match. Alas, I was never to see my alley again but there was a hole you could put your finger through in the bottom of the pail. Right here my trouble began. Hearing the report my mother came out and took in the situation at once. A new pail had been destroyed! Being fleet of foot I got out of her way and for a time, like the Kaiser, I felt quite safe. That night I will never forget. I was awakened by the touch of a strong hand on my arm and an application of a slipper. Indeed it felt as though a dozen slippers were being used upon me. I did

not sleep much more that night and made up my mind to run away. Next morning I was sent to do some work at the back end of the farm. This was my chance so jumping the job I put fully thirty miles between my home and me. I had not a nickel in my pocket and finally hunger drove me to ask for some food. After about a week of this wandering life I returned to my home a sadder and a better boy. My old chum when the excitement caused by our misdeeds had somewhat subsided-used to come over to go trout fishing with me. One day he came over when I was helping my father and he had an otter he had just killed. He had been at the pond fishing when he had noticed two dark animals running along the other side of the road. Picking up a limb he gave chase, heading off the last otter which ran down the road for the pond. He said he had jumped clean over the otter which turned for flight. My father gave him a dollar for the otter which was fully three feet long. Later on this chum took to hunting deer with an old Indian Chief fowling piece, the barrel of which was three feet long. Nevertheless it would shoot a ball equal to any rifle up to about sixty-five yards.

ODE TO A WHIP-POOR-WILL

ROBERT PAGE LINCOLN

Softly among the pines,
Daylight to night inclines,
As in its regal glory sets the gleaming sun;
All in one fainting hour,
Caught 'neath a golden shower,
The darkening lake to Heaven's gate is won;
As on its quickening face,
God drops the kiss of grace,
Breathing: "Rest waters, now the day is
done!"

And moving now no more,
Silent from shore to shore,
Holding the sunset on its dimpled breast:
The lake lies dreaming now,
Unmarred as Love's pure brow,
Snowed in with petals of enchantest rest;
Or lipping at the sands,
Of the embracing strands,
Holds lovely Silence to its deep, caress!

As though the mystery,
Of Life—Eternity,
Were answered here in this transcending well;
As though the falling tears,
The heart-aches and the fears,
In this broad cup were lethe to my knell;
One moment twinkling bright,
And now the ebbing light,
Shines up the white flesh of my living shell!

O soul whence in the dark,
Lone in this drifting bark,
Biddest thou go, to carry me, O whence?
Over what awful waste,
Biddest thou go? O haste,

To shatter like a bubble this dead-drear sus-
pense;

To stroke the pain away,
Into what break of day,
Or purple Night, or Death of joy intense!

Past what horizon bar,
Into what dim afar,—
With pinions spread, O soul where but to go:
Into that outer pale,
Of Life—above the wail,

And the sad sorrows in this world of woe;
Where but to spend the blood,
Sealed on this limpid flood,
And toss forever with the winds that blow!

No! No! the Life is sweet,
Falter not heart but beat,
O beat within me heart of all my heart;
Curb all thy rivers loose,
Be thou my heavenly muse,

Tear not the structure of my life apart!
Cool thou my fevered brow,
Hear my soft spoken vow,—
Cure me of fret, the misery and its smart!

A theme! Great God a theme:
A dream, ethereal dream,
A spark divine, that, flashing, holds the Uni-
verse;

Some crystallizing thing,
Into the air to spring,
Rising on high above this livings' curse;

In this forsaken wild,
Unto my heart beguiled,
A theme, great God that shall my soul im-
mersel

I gasp—I start—I turn;
 I tremble and I burn,
 As on the still night air the answer wakes;
 Under the starry skies,
 Lifting its silvery cries,
 Until the silence into melody breaks;
 Soft-sounding as a bell,
 Shattering all the spell,
 Until the listening heart its weary cell forsakes!

I gasp—I start—I thrill;
 It is the whip-poor-will,
 Hid in the gloom in some mysterious tree;
 Now tenderly and clear,
 Now soft and sweet I hear,
 The magic notes up-rising, ebbing, falling free!
 Silence a little while,
 And now the mystic wile,
 The voice alluring calling out its plea!

I rise—I follow, follow,
 By shore and bosky hollow,
 Where deep the wood fume hangs upon the air;
 As one who seeks a hope,
 I stagger and I grope,—
 Or sink to earth as one sinks down in prayer;
 But though I seek, I seek,
 Or pause to cool my cheek,
 That bird, now here, is fled beyond my stare!

Illusive as the love,
 That born of Heaven above,
 Yet lies upon my weary heart like stone:

Yet ever calling sweet,
 Lures on my plodding feet,
 To find the meaning of this cry and moan;
 With tender-lifted note,
 As in this magic throat,
 Now within reach, and now forever flown!

Is this the answer then?
 Sweep thou into my ken,
 As sweeps a meteor through the gleaming blue;
 Is this the answer given?
 Into what Hell or Heaven,
 Deignest thou turn, O soul of godly due?
 Deignest thou turn, O heart,
 Easing this awful smart,
 Bird then I call—bird then I call to you!

Love, Life and all;
 You are that call, that call;
 And O, I slumber on Life's altar white;
 But may not ever know,
 Dawn and its warming glow,
 But only Night, but only shuttest Night;
 As the soft lids are closed,
 To all the weary host,
 Leaving but thee, O bird, the taper bright!

Imperishable bird,—
 Over the darkness heard,
 Among the stars your soul must ever gleam;
 'Mid angel-sounding choirs,
 And anthemizing lyres,
 Shining upon the Earth a chastened beam;
 Not as the human throng,
 The poet's feeble song,
 But, O, more deathless, Bird, O Bird of Dream!

The Heart of the North

HELEN GORDON

I heard the heart of the North one day
 As it beat 'neath its rocky breast,
 And it's steady throbbing seemed to say
 "Come unto me and rest.
 If your heart is weary and ill at ease
 And doubts are thronging your brain
 Give up your world with its idle toys
 And come back to me again."

I heard it, yet hearing, I went away,
 Back to my dull old world of care,
 Where life's but a stage for a puppet play,
 And Truth dies, in despair.

But I thought, as I passed on my weary way
 Through the land of Thus and So,
 "Your heart is a traitor, make it stay
 In the paths where it's told to go."

Time passed, but the Heart of the lonely North
 Still called to me softly and low,
 Till the spirit that knows no fear broke forth
 And said that I must go.
 Then deep in the green of the pine-clad hills
 I found what I'd sought so long,
 A place that with glory my whole life fills,
 And a heart that can do no wrong.

Around the Round Table

ROBERT PAGE LINCOLN

MR. J. W. Titcomb, the Fish Culturist of New York State took my criticism of him very much to heart, in *re* the poisoning of lakes preparatory to removing the rough fishes in those lakes and installing brook trout. In a letter to me Mr. Titcomb says:

"In a recent number of *Rod and Gun in Canada* I ran across your discussion of the albino trout and thought you would be interested to get some more facts in regard to the albino fish in general. It has been my good fortune to rear albino brook trout. In all probability there will be one albino out of a hatch of 50,000 brook trout, and I sometimes think that one freak appears in every 20,000. Now if these albinos are picked out of the school and carefully reared they will breed true when the eggs of an albino female are fertilized with the milt of an albino male. I have carried them through for a number of years but after they get to be three or four years old they do not appear to have the endurance of the natural-colored fish, or perhaps it is their progeny which becomes weak from inbreeding. The ponds in which they are kept must be carefully protected because these conspicuous albinos are the first to be preyed upon by the kingfisher and other birds of prey. I think there is a stock of the albino fish hatchery at Roxbury which came from the stock which I had charge of in Vermont.

"At the Caledonia hatchery in this State (New York), there are a number of large

albino lake trout. They are so old that they are now blind. From these large albino lake trout reared in captivity have been hatched during the last few years more or less progeny so that to-day there are in stock at Caledonia some two-year olds about 8 or 10 inches long, and some yearlings. The State Fish Commission of Minnesota had a beautiful lot of albino brook trout a few years ago. They make a most attractive exhibit in an aquarium. We seldom, if ever, encounter adult albinos in the wild stock of other species because they are so conspicuous that they are preyed upon and are the first to be destroyed, but I have no doubt you will find albinos occur in all species.

"I do not know whether you are interested in what I have said or not, or what I am going to say. My attention was called to *Rod and Gun* through your article criticising my use of copper sulphate for the destruction of obnoxious fishes in ponds. I think if you had read all of my articles, so that you knew what I was aiming at, you would not be so critical; but it occurred to me that you would like to see some of my writings and get a general idea of my policies rather than to take one subject which, by itself, appears to be very narrow. You will find that I want to utilize every food fish as well as game fish, and make every water as productive as possible with the particular species best adapted to it. In a natural trout pond you cannot produce bass in satisfactory quantities, with

a satisfactory growth, because the basses find warmer waters more congenial and do not spawn in the colder waters until they reach about sixty degrees of temperature, and the young do not grow very rapidly. A lot of our smaller ponds which are natural trout ponds have been stocked with perch, pickerel or some other species which in such waters are not so attractive and do not give the satisfaction which the more valued species will give; and it is such waters that are treated with copper sulphate. It is a matter of course that all fish which can be removed are taken out before poison is introduced. 'Now if you want to see my literature and get more copy for your magazine I will be glad to send it to you.'

This is a highly interesting letter and it is the kind we should like to receive from all fish and game officials. What we want most of all is the latest ideas on fish culture; how to make ponds and how to stock them. There are hundreds of farmers and angling enthusiasts who write asking about pond-culture of fishes. Our officials in both Canada and the United States are well up in this subject and instead of keeping their numerous ideas to themselves they should give them the widest publicity possible, and there is where a magazine such as *Rod and Gun* serves a purpose that is indispensable to the lovers of the out-of-doors and especially things piscatorial. These officials are of undisputed integrity and inestimable value as public servants, but I fear, that, taken as a whole they rarely find outlet for the valuable things they have discovered in their ingeniously conducted investigations. Bulletins issued by fish and game commissions are usually small ones, and their distribution is limited to a narrow sphere. They are good but they do not serve as an agency for a wide and general distribution reaching the people it should reach. That is where a magazine such as *Rod and Gun* serves a direct end. It goes just exactly to the people who desire information on such subjects and therefore does the most good. *Rod and Gun* in the years past has attained to a wide circulation not only amongst the outdoorsmen of Canada but increasingly so throughout the United States, for it is Canada, the great unspoiled playground of the North, that is now claiming attention.

What are the demands of the immediate future? The demands are for a more general knowledge of fish culture and the stocking of depleted waters. In these two subjects are

embraced a world of possibilities. Experimentations and investigations into both of these subjects have proven the unavailability of some projects, and the usefulness of others. It is in getting the information regarding useful projects to the greatest number of people directly interested in those things that we should give our attention to. Here a magazine with a wide circulation comes in as the proper medium of expression.

Within a certain sphere a fish culturist may have an enviable reputation, and within that sphere, (locally), he may be doing a mighty deal of good; but usually many men are lost to the country at large merely by reason of the fact that they do not give voice to their findings. We have known of cases where men have sealed their reputations as greater servants for the public good by contributing to the magazines, such organs as are especially given to talk on certain subjects.

It will be remembered some time ago we had a discussion in *Rod and Gun* on the over-stocking of streams; the Brantford Trout Club of Brantford, Ontario, had written for information. In this case it was proven that not only the streams mentioned had been over-stocked, but it was proven by the heads of this club that other clubs and even the government had over-stocked streams in their neighborhood. Over-stocking was dealt with therefore, and the Brantford Trout Club may be glad to know that I have received several letters from officials telling me that the discussion had taught them many things and that over-stocking seemed to be the rule everywhere. The fact that one letter from New Zealand, one from British Columbia and one from Alabama proves that a magazine with a wide circulation is the medium for releasing information tending to the good of the community, and all communities.

And another thing: What one man thinks is a commonly known fact, therefore little worth mention, turns out to be a point hitherto unknown. It is in sifting out the many points and getting the available ones that should be our duty.

Along the Pacific Coast it is generally held by anglers that the steelhead trout and the rainbow trout are one and the same fish. This has been surprising to me and I have kept studying the proposition for a long time. Barton Warren Evermann and David Starr Jordan in their book on the fishes of North America have written against the belief that the two are one and the same. As follows:

"Although it is not an anadromous species the rainbow trout frequently moves about in the rivers and it often enters the sea, large sea-run specimens being often mistaken for steelheads.

"It is thought by some anglers that the young fish, hatched in the brooks from eggs of the steelhead, remain in the mountain streams from six to thirty six months, going down to the sea with the high waters of spring, after which they return to spawn as typical steel-head trout. This view is unfounded. In my experience the rainbow and the steelhead are always distinguishable; the steelhead abounds where the rainbow is unknown; the scales of the steelhead are always smaller, (about 150), than in the typical rainbow trout; finally the size of the head in the steelhead is always distinctive."

However, Dr. Evermann abandons that theory at this date for he writes me in a letter:

"The steelhead - rainbow - cutthroat - trout question is a very complicated one. I am not sure that I can, in a few brief sentences, clarify the situation. It is certain that there are no real structural differences separating the steelhead from the rainbow trout. It is also certain that in some portions of their range a similar difficulty exists as regards the steelheads and the cutthroat trout. It is equally true that there are several different forms of each of these series. I think this statement is a safe one to make: If a trout hatched in the coastal streams should remain there, never going down to salt water either it or its descendants would be recognized by everyone as a rainbow trout. If it should go down to salt water it would grow larger, lose some of its bright colors, and would then be regarded as a steelhead trout. Of the two individuals of the same spawning if one should remain in fresh water, and the other go down to salt water we would then have the former as a rainbow trout, and the latter as a steelhead, and it would be absurd to say that they are different species. It would be the same as if one brother in a family should remain in the most cultured, civilized community where he would enjoy and practice all the conventionalities of civilized life and the other brother should go to sea and remain away from land for a number of years, never shaving, or having his hair cut, or doing any of those things which are considered the essential things of civilized society; after the lapse of a few years the two brothers would not look very much alike, nevertheless they would remain brothers and

would not be considered as belonging to two different species. This is parallel to what has happened to the so-called rainbow trout and steel-head trout. On the other hand, in most places, the individuals known as the rainbows are easily, readily and properly distinguishable from the individuals known as steelheads, and for practical purposes I am inclined, to think it is just as well to regard them as different species. Certainly so far as the angler and commercial fisherman are concerned, they are different. Of each of the three series, (steelhead, rainbow, and cutthroat), there are many different forms as distinct species. In a new check list of the fishes of the North and Middle America, which I have in preparation, I shall so regard them."

Strange indeed, are the sea-going habits of the fishes of the coastal streams, and amongst them all perhaps the habits of the salmon are the most interesting and at once the most mysterious. Truly it may be said of the salmon: "It's ways are beyond finding out." The life of the salmon is as brilliant and romantic as it is harrowing and tragic. It has its brief time of existence, it fulfills its duty in the eyes of Nature, according to the natural laws by reproducing its kind and then it dies. Its death is not calm and beautiful; it is terminated by agonies; it is fairly ground to death in the watery elements; fungus and disease end it all and the creatures that prey for their living, fall upon them as they float up to the banks, gorging themselves on the loathsome, unclean ones. But, while it lives, no doubt the salmon crowds a great deal of glittering adventure into its life.

The parent salmon enter the rivers that pour into the ocean; they forge on to its upper waters and there cast their spawn. The parents die. When the young hatch out, they, in their turn live in the freshwater of the rivers for a matter of months and then down they go to the ocean and are swallowed up in its immensity. Where do they go to, that is the question that is often asked. No one is able to tell where they spend their lives in the ocean till they themselves return to the freshwater rivers to cast their spawn and in their turn die as their parents died in the eternal round that has gone on for untold ages and ages. They may pursue their way down to South America along the coast or they may go far up into the Bering Sea; they may even go to the coast of Siberia, no one knows. However it is more likely that the

salmon hordes go north, rather than south, since the salmon is strictly a northern fish; hence its inclination lies to northern waters.

After being away for from three to four years the salmon return, full-grown, mature, ready to spawn. They make their way to the rivers from whence they spring, so to speak, and up these they go, steered by a determination that now evinces itself as being the crowning effort of their life of endeavor. And here, too, arises that strangest point of all. A salmon never goes up a stream save the one it was born in. So unerring is this instinct to come back and go up the right river that it is unfailing; and may be taken as a triumph of instinct evidenced as a directing element in wild creatures of fins, fur and feathers. The fact remains; the salmon choose the right river, the river of their youth and up that river they go to spawn in the fulfilment of their duties of procreation.

But strange is the case of the sock-eye salmon. It is found as spawning only in the Fraser River of British Columbia; there it is born and to that river it returns to reproduce and die. Mysterious as are the lives of the various species of salmon, as an individual member, as a separate species the sock-eye is the most mysterious. They present a complex problem indeed for they are identified with one river alone, the Fraser River of British Columbia and will go up no other. Other salmon are found in all the northern coastal rivers, of course each salmon going up the river in which it was born.

When the spawning season is on the Fraser River is the objective point of every sock-eye on the Pacific Coast. And, says a writer on this subject:

"The path of the returning sock-eye after it enters the straits of Juan de Fuca, leading to Puget Sound and the Inside Passage, is well mapped. From the ocean the shining army makes straight for the tip-end of Vancouver Island; near Victoria, British Columbia. Just touching Canada at this point the column makes for Rosario Strait, the lane between the San Juan Islands and the Washington mainland. A small column takes Strait Haro, the western passage between the San Juan group and Vancouver Island, but the two columns of incoming spawning fishes always join again in the Gulf of Georgia and swim on, always against the tides, touching Point Roberts, the north-west tip of the United States and passing just around the corner and thence into the Fraser River. The men who make their fortunes trapping

salmon know these things well. Every paying fish trap which handles sock-eye salmon is located along this given line of march."

Men who have been interested in the salmon from a commercial viewpoint have always wondered how you could change the nature of the sock-eye in its instinct to return to its home river, the Fraser and have it, if possible, to go up some other river. Could it be done? One thing was early discovered in the quest for information into the life and habits of the sock-eye, that was: *It will cast its egg only in a stream which has its source in a fresh-water lake.* Fish Commissioner L. H. Darwin of the State of Washington knew of such a river in the State of Washington and therefore speculated that if he could turn some of the sock-eyes up that stream the deed would be done. Acting upon this (in 1915) the fish traps in the neighborhood of the San Juan Islands were kept open for thirty six hours and the captured fish were to be used as spawners. The spawn-laden fish were now towed in deep crates across the Samish Bay to the mouth of the Samish River. Once at the mouth of the river it was closed off with nets thus to prevent the fish from going out to sea, leaving one other alternative, that of going up the river.

But now the commissioner was delighted and not a little surprised for instead of turning back the sock-eye contingent forged right ahead and went up the stream to the fish hatchery. Here, they were prisoned and killed and the spawn taken from the females. The eggs were milted.

Thus a start was made. In the autumn of 1915 there were over a million sock-eyes at this hatchery. When the fish were old enough they were released in a freshwater lake adjacent to the hatchery. As I understand it, in the spring of 1916 these salmon left the lake and went down-stream to the ocean. And if things turn out as expected those sock-eyes reared in the American waters will return to the waters they lived in. That will happen in the spring of 1920 for then they will be incoming to spawn. *But will they, indeed return to the waters they were reared in or will they experience a reaction and follow the rest of the sock-eye horde up the Fraser River, thus defeating the best-laid plans of men.*

I have heard nothing further in regard to the project. Yet certain it is that the sock-eye specie must again be brought up to standard by the hatchery system for the specie has undergone an exacting depletion in the years that have gone by. As is well

known the sock-eye salmon is sought by both Canadian and American fishers for it makes for one of the best of the salmon group as a tanned product.

A well known naturalist writes asking me my opinion of the Biblical story of Jonah and the Whale. Not feeling capable to deal with the subject I had Dr. David Starr Jordan clear up the matter following the points given in the letter. He comments:

"I believe that it is commonly thought that the story of Jonah, like the story of Job and ancient tales in the Bible is of the nature of poetic fable, and valued, not for its literal truth but for the lesson it may teach.

"One of the most unfortunate things in religious history is the literalizing of words of men who talked with Oriental figures of speech.

"In comparing religious truth to 'the shade of the great rock in a weary land,' it was not meant that the details of the phenomenon

should correspond to those of a shade in a desert. This is the explanation which was given by the well-known Israelite, Rabbi Voor-sanger.

"The ordinary whale of the various species has only a narrow throat and feeds on smaller organisms. The sperm whale, which does not enter the Mediterranean so far as I know has a much larger throat, and jaws with strong teeth. According to *Linnaeus* the whale that swallowed Jonah was a great white shark, (*Carcharodon carcharias*) which has been known to swallow men—but usually in pieces. I secured one at one time at Soquel, California, 30 feet long with a partly grown sea-lion of one hundred (100) pounds which it had swallowed whole. But the sea-lion, though a tough animal did not escape, and was in a rather poor condition when I found him.

"I believe that it is unfortunate that the great and noble parts of the Bible should be obscured by insistence on literalism in Oriental poetry."

A Four Day Fishing Trip

J. H. RUTHERFORD

IT was early Sunday morning that four jolly fishermen left G—for the Bruce peninsula, a trip of one hundred and twenty-five miles. Our tent, provisions, bedding, etc., were all packed into a car with Mr. R—perched on top to hold everything in place and act as lookout, a new kind of periscope as one of the fellows said. It was "some boat" all right and we were bound for Boat lake.

We made the trip in about eight hours, the roads being excellent. The roads in the vicinity of Wiarton are an example to road-makers farther south as they are put down with crushed stone and are very satisfactory to motorists who tour this part of Northern Ontario.

"There's the lake, boys" announced our periscope man and everybody prepared to get out and walk the three quarters of a mile to the lake for we had come to the end of the road and had to take to the woods. By good luck Mr. Martin C., a very accommodating farmer had made a drive through his pasture and bush so we could run the car through to the camp ground. Everything, we found, was in good shape. Supper over—and what a meal it was with ham and eggs, fried potatoes

cheese and biscuits, jam, etc.,—we had a look at the fishing grounds and then after a short time settled down for the night.

Monday morning everyone was up early and before we had had any breakfast we were off to the boats. As I was the only one of the party who had fished there before I had to locate the fish so out to the weedy island we went, the island where perch and pike had never failed me, and which I looked upon as a fisherman's paradise. The boys started in to fish for perch but the pike put a stop to that showing us that they had first place around this portion of the lake. They took worm, hook and all the line they could bite off. Accordingly we changed our hooks and used copper line and in a very few minutes had eleven large pike. The smaller ones we put back. I had now redeemed my promises made to the rest of the bunch as to the good fishing that was to be found in the vicinity of Wiarton, so we went in to breakfast, adding fish to our regular menu. After that our fame as fishermen got abroad in the neighborhood and we had company every evening; so found no difficulty in disposing of our surplus fish.

The first evening we were in camp it was cool and as there were no mosquitoes visible

and as our boys had never tented before we were careless about keeping the tent closed up. The following day was warm and bright and brought out our hungry friends in full force. Things went all right till we were in bed, the last one in leaving the flap open about six inches. We were all ready for a good night's sleep when in came the hungry brutes in companies of tens and thousands. I don't see how they were able to stand the atmosphere of the tent for the air was blue with the language some of our fellows used. It wasn't strong enough however, to drive them out so we had to get up and start a smudge. One fellow even asked what time the train left

in the morning. However, from that night on we took proper precautions and had no more mosquitoes in our tent.

One of the boys, a sort of duck, was fond of going into the water in a very inadequate bathing suit, to put it mildly. He came into contact with poison ivy and there were dire results. With the exception of a few minor incidents such as these our fishing trip of 1918 was most successful. The home run was made in shorter time than it took us to get to the fishing grounds. All returned with the hope of being able to go back another year and repeat the outing.

The Rainbow Trout in Lakes and Rivers Tributary to James Bay

CHARLES HANSCHLDT

BEING a rainbow trout enthusiast I was glad to refer to Robert Page Lincoln's statement made in *Rod and Gun* some time ago in which he says: "I will say that I am of the firm belief that the rainbow trout will be the trout of the future in Canada and the States." I gladly endorse this statement. But, familiar as I am with the enormous network of Lakes and Rivers draining into James Bay untouched by destructive civilization, where the brook trout is undisputed king, if you have travelled as I have over hundreds of miles of mighty rivers with its innumerable tributaries, ideal homes of the *salmo fontinalis*, it is well-nigh impossible to feel alarmed over the future of our all-beloved friend, the brook trout.

Very likely it will surprise you to hear that the rainbow trout can be found in these northern lakes and rivers. I was astonished when I encountered my first rainbow trout in 1911, the year of the big Porcupine fire. My partner and I left South Porcupine on the twenty-fourth of June, 1911; one of the regular old-time gold rushes was on and if there is a thing on earth which is more attractive than a fishing trip it is a gold rush, as the only way of travelling in those days was by canoe.

If the reader will now take a look with me over the map of Northern Ontario, I will show him the places where I have caught rainbow trout and some places where other people, trustworthy and competent, have reported

successful catches. When we look at the map you will easily find Lake Superior, the so-called inland ocean where rainbow trout have become regular citizens through the stocking of the tributary rivers on the southern and western shore going up to the northeastern outlet, the channel at Sault Ste. Marie where the rainbow trout is becoming quite common. Now take a little jump across the map for 100 miles, or so, northeasterly from Sault Ste. Marie and we are over the Height of Land and there you will find without trouble the Mata-gami River and its numerous tributaries. If you follow the map you will find about 20 miles west of Timmins, the Kamiscotia River and a regular network of lakes of which the largest one is appropriately called Trout Lake. It is a jewel of a lake to look at, with numerous small islands and a water so crystal clear that none of the lakes of the Alps can equal it, but nevertheless so deep that you are unable to see bottom a few hundred feet from shore. It was in this gem of a lake that I caught the first rainbow trout, which weighed about five pounds. The rainbow colors being very strong, since then I have caught rainbow trout in the Red-stone River about ten miles southeast of Timmins. I have also heard evidence from reliable sources of the occurrence of rainbow trout in the burnt Bush River, a tributary of the gigantic Hurricanaw River near the Ontario and Quebec boundary.

I have not tried to trace the origin of the rainbow trout in the mentioned places but as

the local places are far from the railroad and difficult of access the only solution or conclusion I can draw is that rainbow trout have been transplanted into the upper reaches of the Matagami River and as it is one of their tendencies to migrate down-stream

they could easily transplant themselves to these localities. But what puzzles me is that I have never seen or heard of any rainbow trout in the Matagami River itself. Can anyone give further enlightenment on this point?

Levant Fred Brown

ROBERT PAGE LINCOLN

ONE of the most talented and delightful prose writers among the anglers of this country is Levant Fred Brown. But not alone is he a brilliant writer but he is a gifted speaker and his various after-dinner talks if collected would make a book that would be placed among the angling classics. Levant Fred Brown is a man of many accomplishments, truly, and not only is he a true student of Nature but he is, an angler with hardly an equal. Wherever he has gone in search of fishing pleasure he has inevitably brought back with him a collection of sketches that deserve preservation. Charles Hallock once said of Mr. Brown:

"Had I the gifted pen of Levant Fred Brown, who finds beauty in every wild and makes the woods and waters fairly gleam in his descriptions, eloquent with poetry and song, (so that even the birds break out responsively to his call) I would braid laurels and eglantines for the heroes whom it is my privilege to name as sportsmen, and whom I have personally known during the period of my lifetime: Brown himself is one of the most charming in personality among the sportsmen, because he is such a nature-worshipper. He could make the dreariest camp environment cheerful with firelight and a genial presence when the weather failed to brighten."

Equally as Mr. Brown is well-known in America so is he known throughout Canada, having fished the streams of the north from the Atlantic to the Pacific. But it is the streams of Vancouver Island that have always riveted his attention, and which hold his heart. There may be other streams elsewhere and they may have the most picturesque of scenery at their command; the fishing may be the grandest thinkable; but they do not compare in his estimation with the streams of Vancouver Island and St. Joseph's Brook in special. That brook he has immortalized and as he has stated it is the greatest desire in his life that he may rest beside it when the last leaf of his book of life has been turned. An example of his after-dinner speeches we give herewith one delivered at a Canadian Camp Dinner in New York City. It is as follows:

"Mr. Toastmaster, Ladies, Members and Guests:

As the then Governor General of Canada,

Earl Grey, spoke to our Canadian Club, at Victoria, he said that distances get less as comfort of travel and speed of trains increase. He used the same truism at Winnipeg the previous week while introducing me to the two fine boys of the British Minister at Darjiling, Northern India, and added that their absence from the University of Oxford on vacation meant for them a trip around the world. I introduced them to a day of trout fishing where the Red River of the North enters Lake Winnipeg, that remote fresh water ocean extending 500 miles into regions west of Hudson Bay.

Each of those youngsters landed beautiful trout, while scarcely a fish rose to my own flies, and I was rallied as the Canadian Expert and Yankee Authority who knew nothing about fishing.

That experience made me shy, and I shall say little here about tents. Their comforts and healthfulness, and the novelty and delight of living in them are well known. When they are pitched in a wild, sylvan region, their charm often amounts to hypnotism—especially when the anglers are like us—votaries at the shrine of the trout-rod, that talisman and wand of delight.

This wonderful Hotel Astor gathering is about the acme of New York City Sport—a tremendous company, in a magnificent room. Yet would we not have exchanged its daintily served courses and the shining tableware, the napkins, and the finger bowls we did not have,—yes, and the white neckties, dress suits and choke collars, for an exquisitely fried, sunny-weather wild trout supper out by the tent and campfire under the sky—out in the Hotel Infinite where endless leagues of blue ceilings grow bespangled at night where dadoes are mountain ranges, where frescoes are so often moving panoramas of changing cloud-palaces?

We prefer the floor of the forest, the carpet of brown pine needles, the rude board table, or a log with one end in a trout-stream and the other gray with lichens or green with mosses. There, sir, the tent and campfire are indeed Home, Sweet Home! They spell happiness, health, room to breathe—air never breathed before, and escape from the city's cooked air and electric fan wind to where a tired body and resting head find grateful sleep on the rubber air mattress or spruce bough bed,

while the smell of burning balsam lingers in the backlogs. There, sir, is escape from the strain of business, with a better chance for a life extended twenty-five or even fifty years.

Tent-life means being right with nature-beauty,—foliage and flowers nodding welcome, mosses challenging admiration. There we talk of it all with our hearts, our love claspings so hard that it crushes what is hollow. We wear old outing suits, hats that have seen better days, and are sun-burned, often unshaved, and always "loose an' free." There, supper is not called dinner, and is eaten where evening leaf-shadows dance over table and tent, and as voices of owls and whip-poor-wills begin to come from a wilderness.

Here one must not eat fish with a knife. There, we often eat fried trout with our fingers. Far worse, sir, the tenting trout-fisher takes himself seriously, and the wild conventionality of his camp does not sanction, as we do here, the placing and using of little wash-dishes right on the table at meals.

Here, city cliff dwellers are above us, shutting out our starlight. We talk over starched shirt-fronts, in white hand-cuffs and claw-hammer coats. If we drink a pledge to the Mysterious Presence we call nature, it is in a libation of Imperial Brut, extra-dry, in saut-erne, moselle, or an after-dinner cordial, not in cold spring water from the big tin dipper soused into the trout stream and brought up, dripping.

So the city dinner of vacation lovers, while a great joy and delight, is a makeshift, a mass-meeting of blackbirds longing to migrate. He who cannot follow this dinner with a real outing, is like the man who married the girl because he could not get her sister. Here on Broadway, the trout rod can be no more than a delight of memory and anticipation. So there is a vital sense in which the real trout fisher does not much believe in city dinners or speeches; for they may seem to him like dressing owl, whip-poor-will, squirrel, partridge and loon in little trousers, like taking a trout from under a bank below ferns to imprison him in a glass tank, like expecting a night-flying wedge of honking wild geese, fresh from loose winds and free waters to be contented in a nicely fenced yard.

We are all aware that words cannot describe nature-beauty. If we were told to visit that park and a match should be lighted whose illumination would show us a moonlit night, that would be no more absurd than trying to use the impotence of words to disclose nature-beauty. We cannot behold and

know it until we ourselves can find nature herself even with closed eyes, ears and lips, and by her heart-beats answering our own. We must be led through her visible beauty into the presence and source of her vital, invisible beauty and know something of the transfiguration and glory in a sunset, of the mystery of life in each leaf and flower, and the wildness in the hoot of an owl, the drumming of a grouse, or the call of a whip-poor-will.

True nature-love is like the Kingdom of Heaven into which we may not enter until we become as little children. Every man here, sir, saw and loved nature best before he began to shave, for he saw her with a child's heart. His best memories make him a boy again beside some brook, or catching perch and sunfish from the pool below the waste-weir, or spell-bound on some beach watching whitecaps and spray, or hunting wild pigeons with an old shotgun or horse pistol that kicks so hard he dares not shoot. Or out of the past, glisten the wet sides of an old boat or canoe as it careens and they rise into sunshine. We need but a keyword to wear these sprays of evergreen, to note a piece of birch bark or the song of a free bird, and we are with the sights, sounds and joys of our own especial outings when country boys and girls. That springtime was the best. We should renew and foster it by revisiting such scenes. They beckon to us. And the tent is their House Beautiful! Camp, clear out! I congratulate the man who can spend even one day and night at the tent of some friend. I rejoice with him who will camp a week, or better yet, a month. And I long to go with the man who will camp all summer.

Every angler, camper, hunter or canoeist knows some very especial forest, stream, lake or mountain that he feels is partly his own—that it was made beautiful for him. So his heart doubly clasps and holds it. And on upper Vancouver Island, sir, is my little trout stream, my second love of brooks—St. Joseph Creek running into the warm but stormy Pacific waters of the Japan current over which the lights from the wireless telegraph station on Triangle Island are struggling through the fog as I talk. I beg you will not consider what I tell you of that brook as rhapsody and exaggeration.

It is flowing now, over white and gray gravel, talking to itself through an almost flowering wilderness of great Douglass pines and spruces, cedars and hemlocks, laurels and rhododendrons, alders, ferns and thorn-bush. I have dreamed of that stream during

two years of illness and banishment from it. But next June I camp beside it, and during the few remaining summers of my life, I sometimes wonder if it does not know I am coming and is rehearsing its music for me.

It is four thousand miles away, but I can see its upper glen, as it will appear, a canyon with banks sloping upward 2,000 feet, and all thickly covered with flower snow—great thorn bushes in the white blossoming of early June. I can see all that at three o'clock in the June mornings as I fish for big trout, while every thorn-flower will begin to have its own dewdrop, and so many of the dewdrops have caught and hold faint glints of starlight. I can smell that cool fragrance as the water croons the night song that breaks and dies along those pebbled banks. God has specially blessed that crystal voice. I am going to it soon to get back and live with my heart. And how slowly the days and nights are passing here! I wander from Brooklyn into "little old New York" and hear the solemn bells of Old Trinity Church pealing out: "Praise God from Whom All Blessings Flow." But for me they also chime the other Doxology of "Only Four Months More." "Only Four Months More!" And as I listen, New York vanishes. I am wading in St. Joseph's Brook long after midnight, casting white-miller flies for big trout. I hear the wind in the tops of the pines. I feel the breath of the cascades and their moisture on my face. Or I see our tent with its pine board table and two or three extra tin cups and plates for visitors. I can taste the hot biscuits baked in the tin reflector, and the wild honey gathered by our camp-keeper. Any sportsman passing there tired and hungry will be asked to stop, rest, eat with us and help us fish along our fifteen miles of the stream. It is my heart talking now. Words, words are cheap! It is easy to weave them into garlands to festoon before a post-prandial audience. But to talk of my little St. Joseph brook and before my fellow anglers? Words are not rich enough!

And next summer, sir, I expect to see the chain fencing replaced around a little clump

of big red cedars on the right bank of that glen. You can hear the water rushing over a series of cascades, and see it in glimpses, winding among the trees to where it empties into Saint Joseph bay and is lost in the Pacific ocean. In about forty years, sir, no sooner, I hope, I and another old comrade already there, will be resting under those solemn pines and cedars. Mother Earth has no other breast which would be so warm for me. In all reverence, I say that I hope my spirit will start from little Saint Joseph river when I am summoned to cross the Dark River alone, and must go up to the gates, guarded by St. Peter to beg of him to let me in because I was his fellow fisherman on earth, and loved my fellow men, and never kept a trout under eight inches long. And he, sir, cannot fail to remember that morning when he girded his own rude fisher-coat around his naked body, cast himself from that little ship into blue Galilee, and swam to where his risen and returned Master had fish cooking for him, laid on that fire of coals, and who told him, not once, but three times, that as he, Peter, loved his Master, to feed his Master's sheep.

Sir, sitting here on my left are two ministers of the Gospel, one at least from the City of Churches. I am a poor sinner. But with absolute faith, with awe, with a head bowed in veneration, I yet believe that if I am permitted to enter Paradise, I shall find my little Vancouver Island trout stream there—that I need only say: "Please give me my wading boots and trout rod and show me the way to St. Joseph brook." I long for its waters, its pines and thorn blossoms! Lead me to where that thin blue column and wisp of smoke is rising through the trees from my campfire on the bank. And show me the board table in the tent with two or three extra tin cups and plates; for I know several old trout fishermen who must, very soon, be coming this way along the bank. And they will be tired and hungry, and will want some hot biscuits and wild honey, and fried trout."

GUNS & AMMUNITION

The Making of a Shooter

EDWARD T. MARTIN

PERSISTENCE and determination will accomplish almost anything, even to the working of seeming impossibilities. I have often been told that shooters, like poets, are born, not made. It isn't so at all. Patience and hard work will make a shooter out of the most discouraging material. Provided that a person has the love of the great outdoors in his heart, no matter how clumsy his hand, how slow his eye, he may graduate from the school of "learning-how," and become an S. B. in the O. A. S.—Bachelor of Science in the Order of American Shooters—if he only thinks he can, and sticks to his work.

Don't I know? In my boyhood days wasn't I the laughing stock among those who could shoot a little bit and thought they knew it all? Only one person had any idea that as the handler of a shot gun I might amount to something, and that one was myself.

Many a shooter has quit the game cold because of a poor score at the traps or a bad day in the field, who, if encouraged, would have persevered and in the end become, perhaps, a bright and shining light in the art of shooting. This was not the case with me. I would not give up. I was bad—as bad as one could imagine with a gun, but was sure I could make a success, and finally improved so much that I was able to out-hunt, out-shoot and out-stay nearly every one of my detractors.

At first I tried to learn with a flint-lock horse-pistol—this was in my weanling days—then, with an army Enfield rifle, a relic of the Civil War, the rifling of which had been filled by leading or maybe worn away by much shooting. The way that gun would

scatter was a caution, but this only added to its value in my eyes, for wouldn't its great spread of shot make a hit possible where otherwise a miss would have been scored? I thought so, because it never occurred to me that there might be many places in the pattern where a bird would be entirely safe.

After this I took a long step forward and got a regular shotgun, a double-barrelled muzzle-loader of English make, a Manton, I think. It would kill, too, in the hands of a person who was able to aim it correctly.

The gun had only a single drawback. It was overzealous and would shoot too often. An opening had been burned or rusted out, thereby connecting the two barrels just above the powder chambers, so that, more than half the time, the pulling of one trigger fired both loads. This sometimes had rather a dampening effect on a light boy in a small skiff, but even a header or two into the lake failed to diminish my enthusiasm. I would console myself for my wet clothes, my black-and-blue shoulder, and my cut trigger finger by thinking, "Two loads are better than one, anyway—if one doesn't kill, the other may."

No one had ever told me that two loads fired at the same instant from a light gun would cause the muzzle to jump, and the shot to go eight or ten inches high.

I had discovered one thing—I wasn't getting any game, which every one said was because of my being such a poor shot. In those days I thought the crowd must be right, and what everybody said, as true as gospel. I had yet to learn that men are often like sheep, which follow the lead of an old bellwether without knowing why or where.

In due course of time I earned enough

money to buy a genuine gun, a pin-fire breech-loader. I soon learned that if a shell dropped out and exploded, when opening a gun of this kind—as once happened in the crowded sitting room of a hunting-house, while a poker game was in progress—there was always a sensation. This particular explosion did more than stir up things in the house where it occurred—it had several effects. It taught me never to bring a loaded gun into a house. It also gave the boss of the house an injury from which he never recovered, though, fortunately, his was not bodily, but merely financial. In the excitement, the table, had been overturned and the hand which the proprietor held, together with the rest of the deck, chips and money fell to the floor in one mixed-up mess. The hand in question was a set of fours against a big full.

Well, when I got that pin-fire and a thousand shells, I was "It." Not that I killed more game; rather, because I could burn a greater amount of powder and make more smoke. There were three of us in camp on this occasion, but the combined efforts of all were not equal to providing sufficient game for the table, although we were not over particular as to what we termed game—blackbirds, rails, yellowlegs, sand snipes, as well as mud hens and ducks passing muster under that title. Ducks, did I say? No, not ducks. Just *one* duck—a little one. I had shot away my entire thousand shells, and this was all that my thirty-five dollars' worth of ammunition netted outside of sundry small birds, and not too many of them, either.

Discouraged? Not a bit of it. I bought more shells and went to it again.

At last I came into my own. Shooting one day on Cartridge Point—so called because of the empty shells I had left scattered around the blind—my companion, a veteran shooter, one who often was able to kill a passing duck and did not miss every shot—I learned what some of my mistakes in handling the gun were, and corrected them.

Previously, my style had been to poke my gun up into the air somewhere in the general direction of the bird and pull the trigger.

Once in awhile I would pitch ahead of my object, move the gun back until the bird darkened over the sight and then shoot. Of course nothing came of such shooting, the shot going several feet behind the duck. Besides, I was always in such a hurry to fire that I was not careful even in my imperfect way.

On the other hand, my companion was cautious and deliberate. I stood back of him so that I could see down his gun barrel and watch his method. I saw his line of sight pass the duck's head from behind and noticed that as soon as daylight showed between the gun and the bird, he fired, often making a clean kill.

This solved the problem for me of why I was such a rotten shot, and I began immediately to put into practice what I had learned, so that before the final freeze came and the ducks migrated, I had acquired something of a local reputation as a successful hunter. Years later I reached high water mark when I killed, shooting from a blind in San Francisco bay, fifty ducks without a miss, and on the Texas coast, 225, mostly singles—besides those the hogs and alligators robbed me of—with 250 shells. My two camping companions, on the contrary, discouraged with their own poor work, and unable to stand the jokes of their friends at their expense, quit cold, and never succeeded as sportsmen, either in the field or at the traps.

Some beginners at the game have a very quick eye. That is good, but the hand should be quicker, even, than the eye.

For two winters I shot in the same blind—a large, heavily timbered affair—in company with a racing judge and a starter of running horses, both of nation-wide reputation. Each of these men, I think, had quicker sight than mine. Their business required a quick eye. They wished to learn the ducking game and asked me to teach them. They would stand behind me, watch how I handled my gun and try to follow my example. They could not do it. Quick as was the eye, the hand was not quick enough. Practice made fair shots of both men, and in time, no doubt, they would have reached the top, but neither ever got quite where his quick eyes entitled him to be. They were too old when they commenced their training.

It was about the same way with my two sons. I began with them when they were weanlings for fair—one six years old, the other seven. Before either ever fired a shot, I succeeded in impressing on both the need of care in handling firearms, which is, really, the first lesson all shooters should learn. That it is the unloaded gun which is always most dangerous, should be drilled into them as a most important part of the lesson.

I stood side by side with my boys in one of my bay blinds, to aid them in gauging distance and velocity. The tendency of a

beginner is to under-estimate both. When a duck headed for the decoys, I explained how to hold and when to shoot, then would kill after they had missed. I paddled them along the rice beds in a little skiff, and had them shoot at every rail, mud hen or duck that jumped; on low fliers, pointed out how far behind or how much under they had shot—that is where all beginners shoot—and helped them in every way. They did well for boys, improved as they grew older and would have ranked high among shooters had not the cares of business shut off the practice of one, and the desire for a first-class education kept the other away from the woods and marshes.

While coaching them, I could not help improving, too. He who teaches another must certainly learn himself. Shooting became an instinct. I made many quick shots that, if my life depended on it, I could not tell where I had held. When I missed, it was usually on a slow-flying bird that I “poked” after.

This shooting by instinct was made possible, by my use of the same gun as long as it held together—which it did for years. I came to believe that a skillful workman is worthy of the best of tools—as good as he can buy; that after purchasing a high class gun, a shooter should not handicap himself by using any and every sort of ammunition. Loads should be uniform; the same make and quantity of powder; the same weight of shot loaded in the same kind of shells. It is poor economy, saving a few cents on a box of cartridges and losing an important match at the traps or a hard-hit duck, in consequence.

Get the best, which, with game as scarce as it is and becoming scarcer, is none too good. To miss, or to “slobber” down a bird that should have been cleanly killed, or only to chip a clay pigeon, will shake one’s confidence in himself and lead to poor work all around and in this way the desire to continue at the game decreases, until a man is apt to quit entirely because of the frequency of bad days, when a slightly increased

expense in the quality of the few boxes of shells he had used would have sent him home with a smile on his face, money in his pocket or game in his bag.

There is little difference of opinion among shooters of experience as to the using of fine shot in preference to coarse, and against overloading, particularly of shot.

For myself, I have killed well on toward 150,000 head of small game; have shot much at the traps, and have picked, helped pick, or seen picked—well, perhaps 50,000 geese, ducks, pigeons and plover—ten thousand ducks in a single winter. I have always been of an inquiring turn of mind, believing that there must be a reason for every unusual happening, and never satisfied until I found what that reason was. Where had the bird been hit, and how far had the shot penetrated? Questions such as these could only be answered by personal examination of the dead bird. Should not information so gained carry weight above the opinions of theorists not one of whom has ever in his life killed 500 ducks or grouse, nor picked a feather from a single bird, because by doing so there was chance of soiling his fingers? It looks reasonable that it should.

In considering the size of shot to be used, one must remember that some guns shoot sixes better than sevens, and others, eights better than either. As a rule, number seven is the best for general use. A beginner should make many careful tests before deciding, then, when his mind is made up, stick to it. He should pay no attention if his friends shout “Too small! Too small!” Number sevens are not too small if the gun shoots well. Personally, I have killed more Canada geese—big honkers weighing as high as eighteen pounds each—with nines than with anything as large as fours. Still, whether it is nines, or sevens, or sixes or fours, the making of a shooter is in his own hands. If he likes the game, and perseveres, all else will come to him, and some day he will be able to kill his share of the game, to break his share of the clays.

Rifles for Target Shooting

K. PINNEY

I HAVE been a reader of *Rod and Gun* for sometime, and think it the finest sportsman’s magazine published in Canada. I do not wish any reader to think I am a crack

shot as some call themselves. I am merely a “sod buster” or “hay seed” as some call us country chaps, but nevertheless I enjoy a few shots when I can squeeze in a few hours

spare time as well as any one you ever heard mentioned. As there has never been any rifle association or small bore club in our neighborhood, and not being well supplied with time, I have not had as much practice as I would like to secure, certainly not enough to make me an expert shot.

My two brothers and I possess a Stevens Ideal No. 47, shooting the .22 long rifle cartridge. This rifle is fitted with a lovely circassion walnut stock and deep Schuetzen butt plate, double set triggers and palm rest. The barrel is a No. 3, and is 28 inches long. This makes it a good heavy off-hand rifle. We also have a .25-21-No. 3, 26 inch barrel to fit this same action.

Our second rifle is a Stevens Ideal No. 44½, using the .25-20 cartridge. This being a plain model, it is not so nice to look at, but is capable of punching them in very closely. It is fitted with a twenty six inch, No. 2 barrel and, of course, is much lighter, making it a nice rifle for hunting "chucks."

The third rifle is Stevens Ideal No. 52, shooting the .32-40 cartridge. It has a fancy walnut stock with deep Schuetzen butt plate, cheek rest, and pistol grip. It has a No. 44½ silver finished action with double set trigger. The barrel is a No. 2, 30 inch. This is certainly a beautiful rifle. It is fitted with a Pope peep sight. This to my way of thinking is the finest peep sight on the market.

The fourth rifle is a .303 Savage. This is just a plain model but being fitted with closed sights makes it a good rifle for the fall hunt in the Northern woods.

I have found that one-half of the good shooting ability is gained through practice in making ammunition, as well as practice in shooting it after you have it made. Factory loaded ammunition is alright for big game and ground-hog shooting or in fact any game shooting, but when it comes to measuring from the tack, they are not to be relied upon so closely as handloads.

The .22 R. F. cartridges factory loaded, generally speaking, are very accurate at short range, but in shooting the .25-20, .25-21, and 32-40 I find them very far out classed, by the hand cast bullets and hand loaded shells.

I notice that several writers speak of the ordinary .22 long R. F. or .22 long Rifle R. F. as a rifle for practice. Well, they are alright for those who care for them, and are nice 'boys' rifles but they are too much chucked up for a man to shoot with comfort. There is not enough room in the stocks on the

ordinary .22 rifles, and I want something larger. I would rather shoot 100 and 200 yards in preference to the shorter ranges, although I do a great deal of short range shooting. Not for five years have I shot at less than a fifty-yard target until just a few days ago, when I made a fifteen shot target at 25 yards. This is target No. 1 which is published with my letters. They are all cutting into the one-inch spot while 8 out of 15 are cutting the ten ring, giving me a score of 143 out of a possible of 150. This I did with the .25-20, using 7 grains weight of F.F.G. black powder and the 86-grain bullet, seated in the barrel just ahead of the shell.

This rifle is equipped with peep sights which I made myself. I have made several muzzle sights for different makes of rifle. Besides those on my own rifles I made both open and closed types and they are all giving the best of satisfaction.

I have attended several turkey matches this last fall, and was very much pleased to see that several of the winning rifles were those with my make of muzzle sights.

I am running away from my story by talking about my sights, so I must fall back to that .22 "stuff" again. There are some .22 rifles that I think are all right. In fact any of them are, in their place, but if I were getting a .22 rifle to suit myself, I would want it in a target model bored to shoot either the .22-15-60 Stevens, the .22-13-45 or even the .22 W. R. F. cartridges. These are all good fifty-yard rifles and do some fairly good work, at 100 yards, especially the .22-15-60 Stevens.

Another writer says "buying a .25-20 or any of the special single shot rifles is the height of folly as they are far too expensive at the present cost of ammunition."

I will give my experience on this very question. Probably this gentleman does not fall in line with my shooting ideas at all, and I do not declare that mine are right. But as I have said before, we use all hand-loaded ammunition with the exception of the .22 caliber. Take the .25-20. Loading this shell with the 20 grains weight of F. F. G. black, 1 lb. of powder will load 350 shells. The No. 1 or 1½ primers cost me .35 cents a box, there being 100 in a box. Powder at .75 cents a pound, making my actual cost of reloading 350 cases about \$2.00. As to the bullets, I will cast enough in a couple of nights to last me for some time. Having had a quantity of scrap lead given to me, and mixing one part tin to 30 parts lead, my

Target No. 1.
143 out of a possible 150 at 25 yards

bullets cost me very little. Now 350 .22 long rifle cartridges would cost at least \$2.45. So I figure that after I get my cases, which are the highest cost, but which last indefinitely where one never crimps them, that I can load my .25-20 shells with a full charge of powder just as cheaply as I can purchase the factory loaded .22 long rifle. I have a far more accurate cartridge and it's accuracy will last up to 200 yards. To load them with miniature loads, such as 7 or 10 grains of powder, they are much cheaper.

I will then meet another gentleman who will say that the repeating rifles are just as accurate as the single shot rifles, and he may also say, that they are capable of shooting a great deal better than the average man can hold them. Well, now if you or I enjoy shooting (that is target shooting) and we are both poor shots, we need the most accurate rifle we can obtain or at least that is my way of viewing it. As to repeaters being as accurate as the various single shot models is another great mistake. There may be exceptions but take them on the whole, there is no comparison, as the single shot will trim them hands down. I have seen fellows trying to fire 100 yard target shooting with a .32-40 repeater, a .303 Savage and a .280 Ross and many other types of repeating rifles. You might as well try to turn a Ford car into a ten ton truck as to turn such rifles into target rifles. Remember, dear reader, I am talking about target shooting alone,

and not game shooting, and do not condemn repeaters in the least when in their class.

What I mean to say is this: that every rifle and cartridge have been designed for a certain purpose. The high power repeaters have been designed for big game shooting. The smaller repeaters for small game shooting and the various single shot target models for target shooting and that alone. When any of these are used for what they were not intended, the best results can not be obtained. I do a bit of hunting myself and with my brother have hunted in the Northern woods several years with great success. Our .303 Savage is the one for that work. This rifle is never put in company with our target rifles as it appears very much out of place.

I know some writers on target work with high power rifles, and I have, also talked with them. I have heard them say "I have a .250-3000 Savage, a .22 high power, a .280 Ross or a .256 Newton." "I can group my shots on a 2 in. bull at 100 yds." This is a little more than I can grasp, no matter if they use a rest or not as I cannot see how such shooting can be done, using high power ammunition, light Spitzer bullets, bottle necked shells, along with quick twist rifling. We have shot nearly all makes of rifles, and have never happened to run across any of these rifles that will do such work as is here above mentioned. It may be possible, yet it is not at all probable. I truly believe that if any person has one of these rifles that

Target No. 2
20 shots at 50 yards with my own make of closed sights Stevens .25.20 rifle No. 44½

Target No. 3

18 shots in succession at 50 yards with my own make of sights. Stevens .25-20 rifle No. 44½

will do this kind of work, they had better keep it for I am positively sure that they will never get another.

I am very much in favor of the Savage rifle as a game rifle and I believe the others mentioned to be good rifles, but I do not think their manufacturers ever intended them for such remarkably fine work. I know there are some high power rifles doing some excellent shooting at long range. I think it was Mr. Landis who published some long range targets made by a .30 Springfield that were exceptionally nice targets. He published them in the November 1918 issue in one of his items on guns and ammunition.

I am very much interested in the items written by Mr. Landis. I consider that he gives the sportsman some information on high power rifles of the very best kind. This talk I am giving you to-day may not correspond exactly with what I have read of his writings, yet if I should express my opinion on high power rifles, they would be very much the same. I wish Mr. Landis would give us a talk on target rifles as I believe he surely must have taken up a course of this sport sometime during his experiments with guns. Yet there is no doubt the talks on the high power stuff will take much better, for there is no doubt that there is a larger per cent of big game hunters than there is of target shooters.

I remember reading a few items written probably a year or so ago by a Mr. King on single shot target rifles and the ammunition for the

same. I have this gentleman pictured in my mind as a real target shot.

Now as to our ammunition which is all hand-loaded in the .25-20, we use the .86 grain ball, and 20 grain weight of F. F. G. Black or Kings Semi-smokeless powder. I do not indulge in priming charges to any great extent although there is no doubt that some of them are very good. In the .25-21 we use the 96 grain bullet and it seems very accurate. In the .32-40 we use the 168 grain ball and 40 grains weight of powder.

There are various ideas on the different charges of powder used in perfecting ammunition for target shooting, also great variations in the ideas of bullets such as narrow, deep grooves to hold more lubricant, very wide banded bullets, or the two front bands being narrow and the back ones wide. I prefer the No. .257320 as illustrated in the Ideal hand-book, for the .25-20 and .25-21. As the .32-40 is a favorite caliber among the larger percent of target shooters, of course, there is a greater variety of bullets for this rifle. We have two sets of moulds, moulding two different shaped bullets in the .32-40 class. Both of these seem to travel very true and certainly seem to be designed for accuracy.

If there was not so much trouble and red tape in getting it across the line and back, I would like to have a .32-40 barrel throated to take the Hudson bullet. I have never used this famous bullet, but I have it pictured in my mind as the finest bullet for target shoot-

Target No. 4

12 shots at 100 yards with open sights. No sighting shots. Stevens No. 44½ .25-20 rifle

Target No. 5
14 shots at 100 yards with open sights. Stevens Ideal
No. 44½ .25-20 rifle

ing. No doubt, a great many of our readers have seen illustrations of this famous bullet and also read a great many items on it and its designer. It is a 185 grained ball. The three front bands .318 inches and the two back ones .323 inches are a trifle wider. In noticing several accounts of this bullet, I see there has been some exceptionally fine shooting done with it. Its designer Dr. W. G. Hudson, by all accounts surprised all the target shots of the world with this bullet and his .38-55 bullet designed under the same idea as the .32-40. There are several gunsmiths through the United States who will turn out a hand-made barrel using this bullet or will throat other barrels to receive it. The Ideal Reloading Tool Company turn out a special bullet seater for the seating of these Hudson bullets and other heavy banded bullets.

As I want to publish a few more targets I must not run into many details. I am not showing you these targets with the idea that they will be the best you have ever seen. They are probably not as good as you have made yourself, but it would look much better to show these few targets so that you will know there is occasionally a time when I can hit the bull. I here show No. 2 and 3 targets. No. 2 is a target which I made over a year ago and on a very cold day. This I consider to be one of the best targets I have ever made on this range. I fired 20 shots in succession

using the same rifle and sights as when I made my 25 yard target which I have published in this item, and using the same weight of bullet and 10 grains weight of F. F. G. Black instead of the 7 grains.

The 20 shots are all well into the 2 in. bull giving me a score of 194 points out of 200. No. 3 target is the same rifle and sights also same ammunition. This bull's eye you will notice is not nearly so good. Just a few days previous I had been shooting in the wind at 100 yards and my sights needed some shifting as you will notice. My bullets are grouped in bunches of three before hitting the centre ring. The cause of this was that I had no one marking for me, so would shoot 3 shots and then go to the target. This of course cut down my score giving me 168 points out of a possible of 180 there being 18 shots fired.

No. 4 and No. 5 targets were both made at 100 yards with the same rifle but with open sights. These are not nearly so good as I have made with the closed sights but as my other targets were done with closed sights I thought I had better show the open sight targets as well. As I like nice open sights and have done nice work with same I was using the same 86 grained bullet and the full charge or powder.

No. 4 target is 12 shots at 100 yards giving me a score of 114 out of a possible of 120 on a 3 in. bull.

No. 5 is the same sized bulls eye, 14 shots giving me a score of 133 out of a possible of 140. This was done with the same outfit that I made my No. 4 target with.

We have had gentlemen laugh and think our own handy way of loading quite a curiosity, but it is the way of nearly all target shooters. We never use crimped ammunition except for hunting "chucks" and small game.

We always seat the bullet well into the grooves just ahead of the shell and never pack the powder in the shell but leave it loose with a blotting paper wad on top.

This method we find very accurate although there are some barrels, Pope barrels, at least the old Pope barrels that they pushed the bullet in from the muzzle with the aid of a piece of auxiliary barrel to start the bullet and then pushing it down to the shell. This may be more accurate, at least that is what

they tell us although I have never tried it myself, I have reason to believe that it is not very accurate.

A gentleman who has one of these Stevens-Pope rifles told me that the only fault he could find with it was the terrible awkwardness of loading up. This, no doubt, is very troublesome as I find seating bullets is enough bother.

I am just a young chap but have shot a rifle more or less since I was seven years of age and certainly enjoy rifle shooting, and I think I am a fair shot but I am personally acquainted with a gentleman who had at one time, and has some of them yet, the finest collection of target rifles and reloading tools that I have ever seen. I consider him to be an expert in rifle shooting. He has done shooting that would make me look green. He may not be so good now as he is just the age that his sight is failing him, but as I am doing the talking I will say he is "some shot."

My shooting consists mostly in target shooting, although I enjoy hunting ground-

hogs, crows and squirrels. I have never tried for the larger game, yet I have a feeling that you may some day see me there, or at least, I hope you may. I specialize in target shooting more than game shooting.

In my practice I shoot from the off-hand and prone positions, off-hand rests, elbow rests, with a sling and with muzzle rests. I shot on both stationary and moving targets at ranges from 25 yards up to 200 yards. I prefer the 100 yard target using a 3 inch bulls eye, using a black bulls eye on a white target—above all others.

This is my first attempt to write for any paper or magazine, and I hope that you, gentle reader, will find it interesting and that if you are a beginner at target shooting and try some of my methods that you may derive the very best results.

Editor's Note—Mr. Pinney's article is very interesting, truthful and practical in every way. I am a firm believer in using real target rifles for target shooting.

C. S. Landis, Editor.

A Letter from John Sharpe

Editor, Guns & Ammunition Dept.

As a reader and admirer of *Rod and Gun* for a considerable period, I have noticed that you have from time to time welcomed, in your courteous and gentlemanly way, letters to the Guns and Ammunition Department of your excellent and steadily improving magazine. Thus encouraged, although in no sense of the term a literary man, I make bold to pen a few lines about the four targets kindly reproduced by you upon page 956 of your January issue and at the same time attempt to give "P.J., Nelson, B.C., the particulars of rifle, caliber, sights and loads which he, as an admitted "rifle crank," is in quest of.

The targets in question were sent in to your magazine by Mr. J. W. Smith, Secretary of the Irish Rifle Association, Toronto, a thorough-going gentleman, an ardent sportsman and a crack rifle shot who has proved his powers with the gun, by successfully competing with and finally beating over 100 (one hundred) competitors in the Toronto C. I. Rifle League this season and landing a magnificent silver cup as Individual champion of this league. The targets in question are drawn absolutely to size, Nos. I, II, III, and IV, are positively correct in every detail, Mr. Smith being

a draughtsman of no mean ability, as well as a writer and shot. Nos. I, III and IV. need no comment; of the loads and particulars of ballistics more anon. Speaking of target No. II, Mr. Landis, it is reproduced full size and not half size as you suppose and is absolutely correct to the slightest detail. As I am writing for the benefit of a so-called rifle crank, permit me a word as to its production. As Mr. Smith says in the short article accompanying the re-produced targets, it was made with the aid of a coach. This man knows my shooting and peculiarities better than I know them myself. I sighted up first on a practice target. Starting with the elevation and windage that gave a 12 o'clock bull he ordered 2 minutes deflection of the rear sight and two minutes alteration of windage on seven consecutive shots until finally he found he was "holding" and in good shape. My point of aim was, and always is, just below 6 o'clock, showing what appears to be a 1-16 inch of white, between the top of the foresight and apparent contact with the bottom of the bull itself.

Having satisfied ourselves that all was O.K. we started in on the real target. My first shot was a 12 o'clock Bull just breaking the black as faithfully shown in the reproduction.

(Remember this effort was to produce a map of the British Isles with rifle bullets—by no means a new idea). This first shot, then, started me on the northern portion of Scotland. Two minutes depression of elevation and one minute right wind was ordered by my coach for the next shot, from his security of a steel sheltered position close up to the target. This alteration of windage and elevation was kept up until Scotland, were produced in bullet holes, when my coach ordered a rise of 6 minutes and an alteration of 6 minutes left wind so that I might "put Ireland on the map." This last shot cost me a certain amount of misgiving. Once or twice before I had found—in common with a certain Imperial Government—that Ireland gave trouble. On a previous occasion, with the best of intentions, I had put "Ireland" in the North Sea, by pulling on right wind instead of left. However, after our care with sights, sling, position and the necessary concentration of mind, my trigger release finally produced the looked for result as witness the reproduction in question. I may say, en passant, that this figure shooting is a great strain on a man and not nearly so easy as it looks.

Speaking now of targets generally, Mr. Landis, I may say that, with the exception of target No. 2 (Map of British Isles) these targets are not hand picked. On the contrary I have in my possession two or three dozen that are as good as those reproduced in your January issue, all witnessed and vouched for by men who are themselves expert shots. Many of these men have just as good groups as I have indeed, two in particular I consider have shot better groups. Why they do not let you reproduce their targets I do not know.

And now to redeem my promise to our friend "P.J.," Nelson, B.C., as regards the dope of my shooting. To begin with, Mr. Landis, you are a pretty good judge as I proved long ago, in matters pertaining to shooting. I have, as you say, spent a lifetime in shooting all kinds of loads and guns. My first gun was an old muzzle-loading Horse pistol, a relic of the "high-way hold up" days. The first target I ever shot at was a bird on the corner of my father's house. The bird was perfectly safe, and he knew it. My aim and intentions were good all right, but my elevation was low. Elevation didn't trouble me in those days and neither did it trouble the bird. I had loaded with a double charge of black powder and with a round stone as a bullet. After taking very deliberate aim, I as delib-

erately pulled the trigger as in duty bound, with the somewhat surprising and disastrous result that a large lump of material forming the corner stone of the house and the perch of the bird in question was dislodged from the place it was originally intended for and dropped with surprising precision and a resounding crash, plumb through the glass roof of my father's green-house which was most thoughtfully and obligingly placed immediately beneath it. What was the bird's opinion of my embryo attempt at marksmanship I have no means of knowing, but my father's opinion of shooting in general and my own in particular I distinctly remember to this day. I may add, that to the best of my knowledge that same bird is still alive.

I lost my Horse pistol and my reputation right there, but I never lost hope. Every time I had a little spare cash it went into some kind of gun or ammunition. After much resting and study and quite a little experience, I finally met a rifle crank, a man after my own heart, with both means and ability to put me on the right track for fine target work. I was "lost" right there. Since then we have had experience with most "worth while" rifles of many calibers and various loads. I obtained fairly close groups at times and met with a fair amount of success. But I was not satisfied. I finally came to the conclusion that a man must specialize to have real success. I started out, but met with all kinds of rebuffs and failures innumerable. Everything, and everybody, including my friends, seemed against me. But I kept steadily improving and that was something anyhow. It is surprising how jealous some people become when they see a man making good. They put every possible obstacle in his way. However, I "kept on keeping on" in spite of them, until one fine day I became the happy possessor of a first class target Ross. Then things began to come my way a little. I worked up all kinds of loads for this individual barrel, got the "pull" perfect, the sling adjusted just right and though I was on the high road to success my groups were not such as I read about and sometimes saw. At last I got possession of a barrel specially made to fit the Ross action by a famous maker in Syracuse, N.Y. (Evidently a "Schoyen"—Ed.) Then I began to make groups that nearly suited me, *nearly*, not quite. By this time I had arrived at that stage when it is impossible to be discouraged any more. The more difficulties, the more effort. My

success was immediate and surprising, at all events to myself. I have spent years in working up loads for different distances, long, medium, and short ranges, but my success in the short range has been greatest.

Now for the details: First, the rifle. The barrel is 30.5 inches long, chambered to take the W.R.A. 303 British shell. It is not chambered too snugly which I have proved to be a decided advantage. It is of the nickel steel persuasion and was especially made as stated above. The rifling is somewhat on the line of the Newton, not having grooves, strictly speaking, but rifled on the segment principle, there being seven of them, having one complete turn in 10.5 inches. The action is the Ross Mark II of the bolt type but tuned up and fitted as close as patience and experiment can make it. The "pull" is a double one, the major portion of which is taken on the first, the second pull being very light. The barrel is bedded in graphite which I claim to be a decided advantage. The stock is one piece and of the finest selected Spanish walnut, fitted and shaped to my own ideas. I have experimented with slings, both as to length and position and point of grip and find that personally the sling adjusted in such a way that it gives a leather cross in which the hand rests beneath the stock, one end being attached by swivel just in front of the trigger guard and the other at the lower band, is the best combination that I know about. The sights were long a source of doubt to me. I have tried all open sights, V sights, U sights, notches, bars, peep sights of all kinds and makes, telescopic sights of many makes, numbers and sights of my own ideas, but at last have come to the conclusion that the sight made by the Canada Tool and Specialty Company is the best of the bunch. The size of aperture has a whole lot to do with a man's shooting. Personally, I find that the size known as No. 8 is the best as far as I am concerned. The sight in question is fitted with an extension bridge which brings it well back to the eye. The fore-sight is of the high and narrow square block type fixed on the sight sleeve in the usual way, but used without the hood, which I find is decidedly the best way to use it. In actual shooting, I find the best plan is to feed each individual shell well into the chamber by hand, to top the powder well back on the primer and keep it there. "Trifles make success, but success is no trifle" we are told. Most certainly is this true of really fine rifle shooting. You cannot afford to overtake

the seemingly most trivial detail when you are shooting in really first-class company.

Secondly as regards the load. First and foremost in this connection you must experiment diligently and painstakingly until you have found the load which exactly suits your individual barrel, for no two shoot alike. I may say without exaggeration that I tried dozens of loads before I found one that exactly suited this barrel. I have tried loads varying all the way from 73 grain lead bullet with 4 grains weight "unique" powder, to 225 grain bullet with 25 grains weight Du Pont No 21 powder. After an infinite amount of trouble and experiment I have come to the conclusion that for this particular barrel, a W. R. A. shell loaded with the 157 grain bullet and 11 grains Du Pont Sporting No. 80 Smokeless Powder with a No. 8½ copper U.M.C. Primer is the best combination that can at present be obtained. My bullets are all hand cast and fitted with copper gas-checks. The composition of the bullet is as follows: Lead 74 per cent., tin 10 per cent., antimony 8 per cent., copper 7 per cent., bismuth 1 per cent. This doubtless will not suit all rifles, but it suits this particular one.

Thirdly the range. I have shot extensively on all the ranges from 25 yards to 1100 yds, but when it comes to specializing one cannot be good at them all, we must be content to put in some fairly good work at one. After long experience and many disappointments I find that the 75 yard range suits me best. So here I attempt to specialize. The range the targets reproduced in the January issue were made on is of that length and situated outside of the northeast section of the city of Toronto. Here my patron does most of his experimental work, I sometimes do a little shooting here too. The end of the range at which the targets are placed has an arrangement whereby the direct rays of light can be admitted on to the targets in the daytime, while a powerful electric light does duty at night. The targets in question were made in the bright sunlight. Of course, the range being covered from the wind does not count. But your rifle, your load, and the shooter must be as near perfect as it is humanly possible to get things. Some days, to save your life, you cannot shoot well. Other days everything seems to go right. No man can always be at his best. The exact name and analysis of the powder with which the four targets were made, I am unfortunately at present unable to give, as it is a new explosive and shell in the experimental stage, but as I

hope it will be in a short time on the market, I will perhaps later on be able to tell more about it. All things point at present to its being a complete success. The position used was prone, with no rest of any kind and with sling. I never had much success with pointed bullets except at mid and long ranges. Target No. 1. was made with flat nose bullet, the other three with round nose, but not pointed nose bullets, 157 grains in weight and of the composition mentioned above and lubricated with the Banana lubricant made by a Buffalo firm. The bullets are cast so that they have five grooves bevelled backwards and filled with lubricant inside the mouth of the shell and one groove in front of the shell not filled with lubricant, but left clear to take up the fouling of the previous shot. The bullet is lightly seated with a hand tool to the exact fit of the shell mouth and is prevented from receding upon the powder by three indents made by another hand tool. In fact, everything is hand loaded which is indeed the only way to obtain real success. Bullets sized down .312 inches.

As showing that the rifle and load as advocated by myself is practical value I may

mention the fact that during the past winter season, out of over one hundred picked shots in the Toronto Indoor Rifle League this rifle holds first place with the fair record of 3 inners only for the whole season, two of which were due to defective shells and one to poor delivery, thus falling only 3 points short of a possible season's score. The last five straight matches being an unbroken run of possibles, surely a fair performance and vindicating my contentions regarding loads, etc.

In conclusion, Mr. Landis, I think I have pretty fully explained all that our friend "P. J." Nelson, B.C., can reasonably wish to know in this connection and if at any time he is my way and feels inclined and will let me know before hand of his visit, I shall be most pleased to show him all I can with regard to my rifle, my loads and other things, myself perhaps included.

Wishing you and your magazine the success you alike so justly merit. Permit me to remain,

Yours most faithfully,

(Sgd) John Sharpe.

Queries and Answers

Editor, Guns & Ammunition Dept.

Your very kind and fraternal letter of the 6th ulto. was received in due time, and I have to apologize for not replying ere this, with regard to giving some range dope for your department in *Rod and Gun*. There are very many more successful rifle-shots than I in Canada who have won their place on Bisley Teams, not once but many times, and are more competent than I to give instructions, etc., in the sport or art of rifle shooting on the range.

It is true I am an old "Bisley shot." I am sixty-four past. I won a place on the Bisley Team for the year 1903, and was fortunate enough to be chosen from our team of twenty to participate in the principal team events: the "Palma," and "Mackinnon Cup." At that time we were restricted to the plain open sights and Lee Enfield Rifle as issued, with sliding bar reversed, blackened and a number of white perpendicular lines drawn on same, about six minutes apart, so as to be ready for sudden changes of wind, especially at long range. Five to seven lines were used, with the zero line the longest, aiming over, or

anywhere between lines as required. For instance, at 1000 yds. in the "Palma" the average was 13 feet left, just outside second line from zero. My score at this range in this competition was sixty-five. At 800 yds. I made a mistake in aiming over the wrong line, and got an outer at nine o'clock. Rifle shots are fortunate in having peep and wind-gauge sights nowadays, and not have to use such crude appliances in long range shooting. At 200 yards we used the plain open V, at which range this pattern of sight was well defined, and high scores on the seven inch bull were made. My best score over there at this range was eleven bulls straight in the "Gregory" winning 7th prize, I think £2. or \$10.00. I made three other seven shot possibles in competitions at this range at Bisley.

With your new Springfield and good ammunition, at your Camp Perry National competitions, possibles on the six-inch bull at 200 yards. will be very frequent.

We have had no Provincial or Dominion Rifle Association competitions since the war began, but in all probability, rifle shooting on

the ranges will again be, as universal in Canada as previous to the war. My eyesight is much impaired for rifle shooting and I will have to give place to younger men. I indulge in a moose hunt each autumn, and spend a good deal of time salmon fly fishing during the season on our small and much depleted salmon streams in Nova Scotia.

I am not much good writing articles. Twenty to twenty-five years ago I wrote some for Mr. A. C. Gould of "Shooting & Fishing" on Caribou hunting in Newfoundland, and hunting the moose on this Province. I was a subscriber to Mr. Gould's first venture, "The Rifle" and continuously to its successor "Shooting & Fishing" until it merged under new management as, "Arms and the Man;" and got many helpful hints from same.

The readers of *Rod and Gun* are to be congratulated on the excellence of your Guns & Ammunition Dept. Your advice as to rifles for moose hunting, etc., I can heartily endorse. I am now using for moose hunting a 7mm Spanish Mauser which I got from Bannerman many years ago, and remodeled to sporting use, and consider it O.K. for my use. Have shot six moose with it and have not lost a wounded one. I first had a Marble Peep Sight on grip; then a Lyman No. 35 on receiver; and now have a Lyman Peep attached to end of sleeve or firing pin, fitting it myself. This I find the best in all lights, and I still have the receiver sight which can be attached in a few seconds and used for fine target shooting at any range.

My load for the above is the 145 grain copper tube pointed Ross bullet, a supply of which I got from Newton in Buffalo, a number of years ago. My powder charge is 48 grains DuPont No. 15. They recommend 49 grains, and stated that pressures would not exceed 50,000 lbs. per square inch with this bullet, and that muzzle velocity would be about 2800 f.s., which I think is near correct for my twenty-five inch barrel. The bullet, although a little oversize, does not seem to exceed the pressures above given, as the fired primers, samples of which I have forwarded to the DuPont people, do not indicate dangerous pressures, and the *accuracy is fine*.

The last three moose were shot with the 145 grain bullet.

One of the best points in this rifle is the stiff barrel. Sudden changes in temperature from very low to high, as say a frosty morning in September and perhaps a 70 degree temperature in afternoon of same day, make no appreciable difference in the sighting; also a

grain or so in amount of powder is not noticed at hunting ranges. This is in marked contrast to a *slender* barrel, high power rifle which I once used.

Later on if you think it O.K. I will write a short screed on the value of snapping practice for young shots; or old shots too, for that matter; also the last word has not yet been written as to proper cleaning of rifles and other firearms, as the hundreds of ruined bores of rifles especially, that one sees everywhere, testify.

I find I have added more to this letter than I intended. Wishing you a successful season on the Rifle Range.

Yours very truly,

James Whyte.

Berwick, Nova Scotia.

Changes in "Savage" Organization

Mr. A. E. Borie has resigned as President of The Savage Arms Corporation and has been elected Chairman of the Board of Directors. Mr. W. L. Wright, formerly Vice-President and General Manager, succeeds him as President.

Mr. F. R. Phillips has been elected Vice-President. Mr. F. R. Pleasonton remains General Works Manager, and Mr. Arthur F. Hebard has been appointed General Sales Manager.

Mr. F. P. Kelley remains Sales Manager of the products of the Company manufactured at their Utica Plant. He will represent the Company in the Western territory and Mr. Harry E. Haynes will be the Eastern representative.

The Company will be represented in Detroit by Mr. Brockolst Mathewson.

Remodeling a Ballard Rifle.

Editor, Guns & Ammunition Dept.

I am coming to you for more advice, although the World War kept me from following out your previous suggestions. You wrote me in regard to my .25-25 Stevens, and now I would like to know if you consider the action of a .38-55 Ballard Pacific, strong enough to stand the .25-35 closely chambered by Mr. Niedner? I noticed in the April number of *Field & Stream*, that the Winchester People have stopped the manufacture of all single shot, falling breech block actions, except the N.R.A.—.22 caliber. I can get the aforesaid Ballard for about \$7.50. Do you think it is strong enough?

I ran into a piece of good luck about a year ago. I bought a .22 cal. Ballard for

\$5.00 and had the barrel relined. When I have adjusted the sights a little closer I will send you some targets that it made.

To be more explicit, I will state what I intend to use the .25-35 for, and that is ground-hogs, crows and target work. I believe this barrel with a twelve inch twist would be a more accurate gun than with a fourteen inch twist, because in Lieut. Col. Whelen's, "American Rifle" he says that this cartridge does not shoot well if the velocity is reduced to that of the .25-20; many of the bullets keyholing. Am I right in my way of thinking?

Should I get such a gun? I may put a Sidle 'scope on it. Do you consider my choice of 'scope a good one? My choice is a No. 45, four power with removable lens, which raises the power to eight.

R. E. Traber,

Platteville, Wis.

Reply—Mr. Niedner does not bore his own rifle barrels. If he uses a Winchester barrel, he must use a fourteen inch twist. If he can secure a Marlin or Remington, it would be bored with a twelve inch twist. I understand he purchases the barrels and rechambers them.

I think that your .38-55 Ballard action will be strong enough, especially if Mr. Niedner bushes the firing pin, which he always does.

For some peculiar reason Lieut. Col. Whelen did not secure good accuracy in the .25-35 Winchester-Niedner rifle when using a reduced charge of powder and metal cased bullets; but he did secure very good accuracy when he used gas-check cast bullets.

I have never used the Sidle 'scope but they have a very good reputation among riflemen.
Editor.

Wants a Bear and Moose Rifle.

Editor, Guns & Ammunition Dept.

I am a great reader of your magazine and as you seem to satisfy all advice-seekers, I would be very glad if you would advise me on getting a rifle. I want a rifle for moose, bear and perhaps deer, but mostly for the two former.

It appears that the expert game hunters prefer a gun that is very mobile, even if they have to dispense with a little killing power. That is all right for anyone who can 'bunch' his shots on a flying vision of deer or moose. However, I am not an expert. What I want is a gun that will 'paralyze' a big moose or bear, if I have the good luck to line up on one. I do not object to a little extra rifle-weight or extra recoil either, as long as it will

decrease my chances of coming home 'skunked.' However, I would like one that has a fairly high velocity and medium length range.

A friend advised me to get a .451 but I know nothing about that gun. What do you think of it for my purpose? Will you please give the velocity, range, charge, bullet, etc., used in the .451; also in the rifle or rifles you suggest?

Will you also state price of suggested rifles and where they may be obtained and advisable weight of bullet to be used? I shall use factory loaded shells for this fall.

Thanking you, I remain,
John W. Smith,

Port Rowan, Ont.

Reply—In reply to your letter I would suggest that you purchase a model 1895 Winchester rifle for the .30-1906 cartridge, and use the 180 grain, metal cased, soft point bullet; or that you buy the same rifle for the .35 Winchester cartridge.

Should you desire an automatic rifle, the .401 Winchester or the .35 Remington Automatic, would suit your purpose very well.

You can secure these rifles from: D. Pike Co. Ltd., 123 King street, East, Toronto.

I am not familiar with any cartridge known as the .451. You probably refer to either the .351 or .401 Winchester Automatics; or else the .405 model 1895 Winchester.—Editor.

Sighting a .22.

Editor, Guns & Ammunition Dept.

Yours is a great work and worthy of the compliments bestowed upon it—some you hear of, but of most you do not. *Rod and Gun* is to be congratulated, for I doubt if it ever loses a real friend, and is always gaining new ones.

If not asking too much, I would be glad to hear from you at an early date, concerning the following: Believing that a .22 Savage Repeater 1914 Model (New), equipped with good sights, will give good results, will you please advise what sights, in your judgment, would be best suited for one having certain typical inclinations, both indoors and outdoors, with such a rifle, and who never did much with any rifle, except miss occasionally a 6 inch bull at 200 yards, standing—one year especially, with an "Army Issue."

I hope you will give me full advice in this connection, for, while I have read much concerning rifle and sight dope, I assuredly cannot claim to have any specific or practical knowledge.

"When I speak of good results (all things

being relative) I simply express a desire for such: better results for example, than befell my lot with an old Flobert, which some years ago was the pride of many a lad's heart. This reminds me, your articles, and those of your associates, are scientifically interesting but I rarely get to hear of how all you experts started in the game. I mentioned my first rifle—the old Flobert (You all remember it) but will no one confess of having made just a few “misses” attributed to the minor defect of say four solid inches of solid lead being jammed in mid-barrel?

Now, to finish up, I am getting a supply of .22 Lesmok long rifle cartridges with hollow point bullet, for small game shooting, unless you advise otherwise. Is it best to use the same ammunition for short range target work?

Can you conveniently give me any figures approximating the velocity and energies at muzzle, 25 yards and 50 yards of—Firstly; .22 long rifle cheap smokeless cartridges in the Winchester single shot 1902 Model, and Secondly; of afore mentioned Savage Repeater and Lesmok cartridges? Should you conjecture that I am aiming to jump from the little rifle and cheap ammunition, to the other class of Savage and Lesmok, you are right, and our thanks are due you.

You'll again hear from me, if I have anything worth while to tell about “Dead Crows and Targets.”

W. E. Henthorn, M.E.

Montreal, Can.

Reply—In reply to your letter of April 16th, I would recommend Lyman No. 2A, and No. 8, as being a very practical set of sights for the Model 1914 Savage rifle for all purposes.

The .22 hollow point bullet is all right but the solid point will probably be slightly more accurate.

The muzzle energy of the .22 long rifle cartridge would be about 85 ft. lbs., and possibly 70 ft. lbs. at 50 yards. There would be no appreciable difference between the ballistics from the two rifles.

I notice that you think it's about time for me to confess some of my past sins. After reading my life's history in *Rod and Gun*, I agree with you as I think it would help to square matters with the readers. The best hunting experience that I ever had happened when I was quite young. I missed twelve straight quail one day and the next day I shot at thirteen and winged only one of them, and it ran under a brush pile. It was necessary to tear down the whole brush pile to get

that one quail but I eventually succeeded. I had more fun catching that one quail than you could imagine.

Another time when I started out with my first rifle and shot at my first squirrel, I managed to place a bullet through both eyes at fully 60 yards. Immediately, I imagined that rifle shooting was quite a simple matter. After failing to shoot another squirrel that season, I changed my point of view considerably.

I remember knocking a squirrel off of a tree and on running to pick it up I fell over a log that was at least two feet thick. In falling over the log I broke my rifle stock, and in doing so, discovered for the first time that that log existed. Those were great days but some of them had better not be spoken of in company.

On another occasion I fired possibly thirty-five cartridges at a hawk before finally hitting it. From this you can understand that I have occasionally missed something. Well, misses do not occur so frequently at the present time, still they occur and I suppose I might as well own up to it.

I hope that after this confession you will feel that your case is not altogether hopeless.

Editor.

Cleaning a Leaded Barrel.

Editor, Guns & Ammunition Dept.,

Will you kindly let me know how to clean a .22 W. R. F. rifle?

I have a .22 W. R. F. Mod. 1890 Winchester rifle that is slightly leaded. What would I use to clean it and where could I get it? Is there any place I could send it to have it cleaned?

A Constant Reader.

Carman, Man.,

Reply—The best way to remove lead would be to use a good stiff brass brush, and scrub it out well with this brush. Use a .22 caliber Marble brush, or a .25 caliber brush that has been used slightly. If this will not take it out, plug one end of the barrel with a cork, then partly fill the barrel with quick silver and run this back and forth in the barrel occasionally. The lead will amalgamate with the quick silver.

If you cannot remove all of the lead in this manner send the barrel to the Winchester factory. —Editor.

Notes on Deer Rifles.

Editor, Guns & Ammunition Dept.

I wish to congratulate C. S. Landis for his

version in selecting a rifle for deer, entitled "common sense in purchasing firearms." I notice in every *Rod and Gun* someone asking the question as to the best rifle for killing deer.

Now I have used a rifle upwards to thirty years (not so very long either) but in that time I have learned considerable about care, ability and how to handle a rifle. I was so impressed with the writing about the .30-30 carbine that I could not refrain from congratulating the writer.

Now I hear someone say "I bet he uses a .30-30 Carbine." Well, I have used one but now use a .32 Winchester Special Carbine, and I believe Mr. Landis would also endorse this gun as there is very little difference between the two.

The reason I use the writer of "Common Sense in Purchasing Firearms," as an example is that his writing gives me the impression that he is a practical man and has used probably as many different calibers and makes of rifles as the ordinary hunter, and that he believes a thing to be true when he sees it, not by picking up catalogues of different gun makers, and using their tables of ballistics on velocity, penetration, trajectory and then judging the best killing gun.

In my experience, penetration is not exactly the best feature in a gun for killing ability. I notice in last month's *Rod and Gun* in the killing power of the .250-3000, how you would pick your game up where they were hit, not 50, 100 or 200 yds. from where you shot them.

Listen friend, I have seen deer picked up over a half a mile from where they were hit with a .250-3000 and have also followed blood on a track and never found the deer. I am not saying that if the same deer was shot in the same place with a .30-30 that they would have dropped on the spot, but I do say that they would not have run any further than when they were shot with a .250-3000.

With my experience, I truthfully and without prejudice believe for the all round rifle a .30-30 Carbine or .32 Special Carbine weighing only 6¾ lbs. makes the finest little gun for deer, that is in the market (and make no mistake they will kill moose too) and I believe and have reasons to believe that in Northern Ontario they are like Ford cars. Why? Because you can buy ammunition at a reasonable price anywhere, and they certainly deliver the goods if you hold "them on."

Port Colborne, Ont.

J. S. Sherck.

Reply—Glad you liked my article..

Dept./Editor.

Notes on the .250-3000.

Editor, Guns & Ammunition Dept.,

I have been an ardent reader of *Rod and Gun* for the past ten years at least. I have never contributed to its columns but have always read it from cover to cover with interest. I do not claim to be a gun expert, a shooting expert, a big game hunter or a story teller, but have done a little of each.

In the way of firearms I have used quite a number of different kinds, from the old muzzle loaders to the automatics. At the present time my arsenal consists of a Standard Automatic Rifle, using the .35 Special Cartridge, and a .250-3000 Savage. In small rifles, I have a Savage .22 Automatic 1912 model and a Savage tubular Magazine 1914 model.

In shot guns, I use a 12 gauge Tournament grade both for game and trap shooting, also a 20 gauge, both Winchesters, and also a couple of revolvers. I generally get my game with either shot gun or rifle. I have a Western Automatic Trap for Blue Rocks, also a Du Pont Hand Trap.

Being handicapped in such a small place in keeping up a gun club, I installed the Automatic for my own pleasure. I am a fair trap shooter, and occasionally am able to enjoy a shoot with the Moose Jaw Gun Club, and my Winchester generally manages to give a good account of itself.

Speaking of rifles, it was an article in your April Number of *Rod and Gun* headed "Deer Rifles" by P. A. L. that is responsible for my sudden outburst. This has reference to the .250-3000 Savage. Several times I have read articles about these rifles in your magazine and I am the proud possessor of one of these sure death dealers. Having shot moose, elk and deer with it and knowing from experience the killing power of this little rifle, and then to read articles in my favorite magazine, recommending such a rifle as I have as "A GOOD CROW OR WOOD-CHUCK GUN," you may be able to imagine what kind of a feeling I experienced and especially against the Editor as it was a recommendation of his, I thought if this gentleman had ever lived on the prairie, he would have been recommending it for a good gopher gun.

I have not been able to get out big game hunting the past two seasons, but the year

previous I secured a large elk at a distance of 140 yds., with a neck shot, and it only required one.

This animal was stone dead when I reached him, and it was only a very few minutes. It was my first elk, and you can get up considerable speed on an occasion of that kind.

The previous year I secured a fair sized moose, only 42 inch spread, with a "behind the shoulder shot" at a distance of 100 yards. This animal did not have time to straighten his legs out properly before life had departed. I have cited these two instances in support of the big little gun, the .250-3000 Savage.

It was with a thrill of pleasure that I read the article referred to when the rifle was even recommended as the best deer rifle. I have a hunting partner who also uses the .250-3000 and he never fails to get his limit.

Will send you later a photo of a deer head, which I secured last fall, and which is a very nice specimen.

In comparing the .250-3000 with the .256 Newton, I only speak from my experience with the rifle I am using, having never used a Newton. I do not know anything about it, but if it is a better killer than the Savage, I will have to have one, but it has to go some at that.

I am only waiting an opportunity to try this rifle on some of the game found in the Rockies, which no doubt will be a little more exciting than moose, elk or deer. With best wishes to *Rod and Gun*, I am

Yours very truly,

A. S. MacDonald,

Expanse, Sask.

Reply—You will understand of course, that the .250-3000 may be reloaded with a mid range load and when so loaded it is a cracker-jack woodchuck and crow gun. You hit your two moose exactly right. Wait until you shoot a few in the hips. You may then lose some of your enthusiasm for a light bullet as a moose killer.—Editor.

The Stevens High Power Rifles.

Editor, Guns & Ammunition Dept.

Allow me to say a few words on the Stevens High Power rifles. I note on Pages 1432 of the May *Rod and Gun in Canada*, an inquiry about them and as I am somewhat of a

gun crank, will give my opinion of the Stevens High Power rifle. I have used the .44-40 Winchester & Marlin, .38-40 Winchester & Marlin, .30-30 Winchester, Marlin & Savage, .38-55 Marlin, .32-40 Winchester, .303 British, .303 Savage, .35 Remington Caliber Stevens rifle and .351 Automatic Winchester, also a .22 High Power Savage, and of them all, my choice of an all around deer and black bear rifle is the Stevens. I have lost but one deer that I hit with the .35 Remington Stevens and I used it three years and killed all the deer that the law allows and have loaned it to several friends. They all say that it is the best deer gun they ever used. I like the automatic very well but for accurate shooting, give me the .35 Remington Stevens. I like the .303 Savage fairly well only it is made in a boy's size. If the Savage people would put out a rifle that would handle a cartridge like the .303 British and have a 22 or 23 inch barrel weighing about 7¾ to 8 pounds then they would have a man's size rifle. I think their style of magazine and safety cannot be beaten in a hammerless rifle, but I am inclined to be old fashioned and am in favor of the hammer lever action rifle and heavy bullet. I have had a lot of crippled deer get away with the smaller bore rifles but when the .35 Remington Stevens cracks, the deer falls as though it had been struck with a sledge hammer.

The largest deer I ever killed dressed 246 pounds and was shot at about 200 to 225 yards. The bullet went in the neck just back of the head and came part way out on the left shoulder. I say part way out because the butt end of the bullet was out through the skin and the mushroomed end of the bullet remained inside. By using the point of my knife I got the bullet out and have it yet. Would say that if P. J. Nelson wants a good deer and black bear rifle he will make no mistake in purchasing a Stevens High Power. I also understand that the Stevens Arms & Tool Company make the 1910 model High Power Rifle in other standard calibers.

J. S. Burton.

Fassett, Quebec.

Reply—Thank you for this interesting letter of information.

The Black Bass

ARCHIE P. MCKISHNIE

(All rights reserved.)

I PRESUME every angler's knowledge of game fish and their habits is based, largely, on his personal experience with them. It is indeed a brave man who will pose as an authority on any one of the fighting denizens of stream or lake, and I believe all "Old Timers" will agree with me when I say that the longer and closer the study of game fish, the least inclined is the student to make a positive statement of fact concerning them.

Game fish form a most interesting field of study, no doubt about that, and it is not at all difficult for one to secure a lot of worthwhile knowledge concerning them. Every boy who has poled a boat through the sandy shallows, during the first warm days of May, has come across a bass nest of pebbles from which the female bass has scooted like an angry bird only to return and hover close to her eggs, ready to do battle to her intruder. At such time she is easily captured on any kind of lure. But she bites because she is angry, not because she is hungry. Of course no boy possessing the instincts of a sportsman will catch her at this time, but will leave her to guard her spawn and marshal and protect her young when they break like tiny hairs from the little round eggs.

So likewise with the trout who seek the deepest holes in the stream and lay their spawn in the early autumn. Their spawning and living-habits up to a certain point are not difficult to learn. It is the roaming and feeding habits of game fish that baffle most of us; particularly those of the Black Bass.

THE GAME BLACK A ROAMER.

Has not some confiding nimrod said to you; "I know the dandiest spot for bass."

But does he? Perhaps after going along with him and fishing that "Spot" all morning, with not so much as a strike, you'll doubt his sincerity. He'll say, "Can't understand it at all. Caught nine beauties here only last week." There you are. The fact that he caught nine bass in a certain spot last week offers no guarantee that he will take bass in a certain spot whenever he so desires. And there are anglers—some of them old enough to know better—who will argue that bass hold pretty well to the same feeding-ground.

This is, in a measure, true of the "Large Mouth," who is a frequenter of shallows, holding to sunken log or deep hole along shore. Catch him, and another homeless Big Mouth is pretty sure to take possession of his home. This is why a certain log or hole may afford a strike morning after morning.

But the fighting, game small mouth is an entirely different fish from his big, indolent cousin. He makes company and very often during the warm days of the open season, travels in schools. Unlike the trout who is seemingly always hungry, he feeds, it would seem, only periodically. There are days when no lure will tempt him. On the other hand, there are days, providing luck leads you across the school, when you may catch your limit easily.

A Small Mouth who got away with a hook and part of leader was caught the following day six miles remote from the scene of battle. Similar cases have been cited by anglers, which proves conclusively that this game fish is not given to loafing in one spot. Naturally the question arises "Would not this particular fish, crazed by the barb in his jaw, put as great a distance as possible between himself and the danger-zone?" He might, but never has he been known to do it; in fact, his fighting spirit being fully roused, he is inclined rather to hold his ground and attach with indomitable spirit any lure offered him. His companions, however, may become frightened by the strange antics of the hooked fish and move away. Undoubtedly this is why an unskillfully-handled fish will often spoil a promising morning's sport.

BASS GROUNDS.

Of course all fisherman have their favorite waters. Some sojourn each season to the river, bay or lake which they fished when a boy; the bass may not be as plentiful as of yore but the same old lights and shadows, scents and restfulness are there, and after all that's a great deal. Others will, of necessity, journey farther remote in search of the sport they desire. Northern Ontario is the Mecca to which many anglers are turning to-day, Algonquin Park, the three million acre game preserve of the Ontario Government with its thousands of spring fed lakes

and deep streams being noted for its big trout and bass. Here in this veritable wilderness one may follow swift stream for speckled beauties, whip the ripples at morning or evening with bass-fly, or fish the deep waters

for the lordly, greyling trout with satisfying results. Modern hotels, with every comfort go far towards making this spot the fishing rendezvous of anglers from all points of the continent.

The Rational Utilization of Game

Read before the National Conference on Game and Wild Life Protection, at Ottawa, February 18 and 19, 1919.

WILLIAM T. HORNADAY

Director, New York Zoological Park

IN every new country, man struggles mightily to harmonize with his environment, and survive. Naturally, it is the newest countries that contain the most wild life. It is the way of the average frontiersman to make war on the game, and war on every man who seriously attempts to protect it from his onslaughts.

In every country, new or old, the utilization of the wild game, and its perpetuation or extinction, are all determinable by the inexorable rules of logic, and of reasoning from cause to effect.

The interests of a great number of people are paramount to the interests of a few. To the conservationist of natural resources, waste is abhorrent, and the extermination of valuable species is a crime. The robbery of posterity is wicked and repulsive: and all robbery deserves to be either prevented or punished.

In every well-settled country containing a fair supply of game birds, game and fur quadrupeds and food fishes, the questions

involved in the taking and utilization of those assets of nature create an irrepressible conflict. Every country produces its annual crop of uncompromising destroyers, and some countries contain a few real conservators.

The western world contains few fanatics of the oriental type to whom all killing is abhorrent and wicked. The white races of men believe in the doctrine of legitimate sport and sensible utilization: but the game-hog is a constant menace.

The game-hog is a factor with which every government and every individual game protector must reckon. In the slaughter of game he has no conscience, and to him game laws are an intolerable evil. He is utterly devoid of sentimental or scientific interest in wild life, and he will go far to kill the last representative of a species in order to boast of it.

Some game-hogs who are honestly ignorant of what they are, can be educated out of their evil ways, and reformed: but others can not

be. The last annual report of the New York State Conservation Commissioner, George D. Pratt, contains this striking passage regarding the confirmed game-hogs of the Adirondacks who slaughter deer illegally, and for whom on one can plead the excuse of ignorance. Commissioner Pratt says;

"An analysis of the violations thus reveals that they were due not to dissatisfaction with any one law, but to general contempt for the Conservation Law *per se*. The protectors, disguised as sportsmen, were all required to report whether the hunters in the camps to which they were assigned operated on the general plan of killing practically *anything* that they saw, and more than two-thirds of the protectors answered this question in the affirmative. The result of this determination is shown in 101 deer that came within the protectors' immediate knowledge,—in most cases under their personal observation. Forty-six were bucks, 44 were does, and 11 were fawns of both sexes. It was a matter of great interest in one camp that one man had killed eight does in the season, while another at the same camp, by a singular coincidence, had killed eight bucks.

"There were many more illegally killed deer than those mentioned above," says the Commissioner, "regarding which the protectors obtained evidence that resulted in settlements or convictions. Cases arising from the 1917 work were settled for \$3,511.50. They involved 79 individuals and more than 125 violations. Already in 1918, 38 cases have been settled, with a total recovery so far of \$4,245.00. The 1918 cases alone will number between 200 and 300 when all have been closed.

"The Commission wishes particularly to point out that the violations of the deer law involve no particular class or locality more than another. Men of all walks of life are involved, and even some women, who deliberately stood upon runways in wait for deer that were being run by dogs. Efforts to correct the old, outworn point of view regarding wild life—a point of view that would make game the property of whoever can get it, regardless of law—*must accordingly be directed to every class and locality.*"

Now, in the making of laws, it is always necessary to make the laws adequate to curb the worst elements. No sooner is a new game law enacted than the human vultures who prey upon wild life immediately scrutinize it and study it in order to find its weak spots, and to plan evasions. It is this devilish spirit

of criminality that renders it so difficult to provide for the utmost utilization of wild game as food for man. Whenever we see the day wherein all men will gladly obey the *spirit* of a law, as well as its stern letter, then we may say that the millenium of game protection has arrived.

The continuous development of the interior regions of Alaska and northern Canada, the increase in power transportation, of mining and of general exploitation, has brought a corresponding increase of pressure on the remainders of big game. The valleys of very few navigable streams now contain any considerable remainder of moose, caribou, mountain sheep or bear. To find big game now it is necessary to strike into the interior. The great herds of caribou that only forty years ago came within gunshot of St. Michaels, Alaska, at the mouth of the Yukon, have vanished from the lower Yukon almost as completely as if they never had known that region. Now the residents of St. Michaels must travel hundreds of miles to find the nearest herds of the caribou millions.

But the disappearance of northern big game is a large subject, and not to be entered upon here. We are concerned with the rational utilization of the stock that remains. The practical questions now before the people of Canada and Alaska are as follows;

- (1). How can we secure the most thorough legitimate utilization of wild game?
- (2). How can wastefulness be prevented? and
- (3). How can the continuity of supply be insured?

The moment we undertake to conserve big game in the northern two-thirds of Alaska, which is north of the 62nd parallel of latitude, we come up against some strenuous demands for the sale of game. Fairbanks now is the storm-centre of a new demand, for the sale of game all the year round, instead of in the open season only. Most Alaskans believe that the game of Alaska belongs to the people of that territory, that they should administer it as they think best, and above all, that the sale of game is not only right, but absolutely necessary.

In 1918, it was noted that the laws of the United States were permitting the sale of moose, mountain sheep and caribou meat, during the open season for hunting, everywhere in Alaska north of Latitude 62, and that during the year 1917, 6,000 pounds of big game meat *lawfully* had been fed to the labourers employed in the construction of

the Alaska Central Railway, actually under the supervision of the present Governor of Alaska. That large figure was given by Mr. Thomas Riggs himself, then Alaskan Railway Commissioner, at the hearing on the Sulzer Bill, in Congress, on March 5, 1913.

The Sulzer bill proposed that mountain sheep, moose and caribou meat should be sold all the year round, everywhere north of

Every conservator of American big game is at least partially aware of the conditions that surround white people who live all the year round in the northern regions of Canada and Alaska. Away from the influence of the lines of power transportation, the procuring of supplies of fresh meat from the flocks and herds of the stock-raiser and farmer is an impossibility. And it is not good that men.

William T. Hornaday, Sc. D.

Latitude 62 degrees, and it was ardently supported by Mr. Riggs and the people of Fairbanks. The new measure seemed to be so destructive to the big game of Alaska that the Sulzer bill was easily killed. The episode emphasized with new force the fact that a new game act for Alaska now has become an absolute necessity, and must be worked out in the near future.

women and children should be compelled to subsist for long periods on no other flesh food than dried fish, dried venison, bacon and ham. If we concede that it is right for the trader, the missionary and the soldier of fortune to live in the far north, and rear families there, then we must concede that they are entitled to some supplies of fresh meat from the wild herds that can afford them,

without the risk of extermination. In the language of commerce, we believe that they are entitled to all that the traffic will stand.

The question is; how can we meet the legitimate needs of the widow of Fort Churchill, the trader at Fort Resolution and the missionary at Point Barrow, without the risk of annihilating the breeding stock? Let us assume that no one of these can go out, license in hand, and themselves hunt and kill their own lawful quota of game.

In the utilization of the wild game food of those regions, the non-hunters must not be fatally penalized because of their physical or other disabilities that prevent them from personally taking their own share of game on the hoof.

Now, what is to be done?

The men of the Far North at once will say; provide by law that all those who cannot hunt may buy their share of game from those who can hunt.

This proposal merits careful analysis and consideration.

It is now a widely accepted principle of conservation that no wild species can long withstand commercial exploitation. It is an accepted fact that the surest way quickly to exterminate any wild species is by placing a cash price on the heads of its members.

Throughout the whole of the United States, and I think all of southern Canada, the conservers of wild life are a fixed and unalterable unit in opposition to the sale of game, anywhere, in those regions. That matter has been considered, and at times fought over, for fully ten years; and if any principles in wild life protection can be regarded as settled for all time it is the ban on the sale of game, and on the sale of the plumage of wild birds. The Sulzer bill could have been, and would have been, buried under a mountain of opposition, both in and outside of Congress, had it been pressed forward.

In view of the well-known and legally recorded beliefs of the wild life conservationists of Canada and of the United States, I now regard it as a waste of time to attempt to devise ways and means for the sale of wild game. The principle that lately has been so gloriously reaffirmed and so everlastingly fixed by the international treaty between Canada and the United States for the protection of migratory game birds against the market hunter and the game-dealer, must not now be discredited in the Far North. The time has come that the sale of game in Alaska must positively stop, before it has wrought

more harm to the game and to the people of Alaska.

It is a curious circumstance that the men who thus far have saved some of the game of Alaska from annihilation, have done so without either appreciation or thanks from the people of Alaska. But for the initiative of the meddlesome "eastern naturalists," in 1902, by this time the accessible regions of Alaska would have been swept bare of hoofed game. It is utter folly to assume, or to believe, that the people of Alaska alone are either willing or able to protect their big game from extermination, and utilize it on a real continuing basis. In times like the present the truth may better be told bluntly than in any round-about way.

The people of Alaska are, from first to last, diligent exploiters of the natural resources of Alaska, and the majority of the white populations look forward to getting out of that Territory to spend the remainder of their lives elsewhere. Twenty-five years hence a majority of the Alaskans may be sincere conservers; but a quarter of a century is a long time to wait, and in the interval much mischief may be accomplished.

No; we can not agree to any sale of game; anywhere; because that policy is known to be extra destructive. At all hazards the big game of Alaska and northern Canada should be conserved on a continuing basis, for the good of the residents of those difficult regions.

The hunters of Alaska may find it impossible to believe that "eastern sportsmen" have at heart the welfare of the *future* residents of Alaska who will need wild meat. No doubt very many of them feel that all the protective efforts of United States men are designed to protect United States hunting grounds; but all misunderstandings of our motives in Alaskan conservation we must accept as an unavoidable part of the burden, and as coming all in the day's work.

I believe that on this point we are indeed thinking more of the welfare of the Alaskans of the future than is thought by the Alaskans of to-day.

And now what can we offer as an attempt at a solution of the puzzling question raised by the widow at Fort Churchill? It is time to put forth something intended to be constructive. We are absolutely certain that a way can be found to protect the rights of the widow, the missionary and the trader without the surrender of a great foundation principle, and without going halfway to meet disaster by providing for the sale of game.

In an effort to be both brief and clear, we submit the following proposals as candidates for adoption into a code of principles:

Proposed Principles.

1. In the *well-settled* regions of the United States and Canada, the supply of wild game is nowhere sufficient to render it an important food supply; and in view of its steady destruction by man, predatory mammals and birds, severe winters and scarcity of food and cover, game-killing in those regions must be regarded as a severely limited pastime, and not as an industry in competition with the stock-raiser and the butcher.

2. In well-settled regions, it is impossible to make bag limits too small, or open seasons too short, for the best continuance of the game supply.

3. No frontiersman can reasonably be expected either to devise, or to execute, unaided by his federal government, methods for the adequate preservation and increase of large game.

4. Well-settled and well-fed regions require game laws of greater stringency than frontier regions.

5. Frontier and savage regions require to be specially defined on the map, and provided with game laws specially adapted to the needs of their inhabitants and to the available supply of game.

6. The strict regulation of game-killing in frontier regions inures directly to the benefit of the people most dependent upon the game for their existence.

7. The sale of game should not be permitted at any time, anywhere: because all commercialization of wild game and other forms of wild life is thoroughly exterminatory in its effects.

8. In all countries, the rational utilization of game is desirable, but only on a basis that will provide amply and adequately for the perpetuation of the breeding stock.

9. Regions that are remote from lines of power transportation, or are in winter entirely cut off from supplies of fresh meat from without, are entitled to preferential treatment.

10. The relief of persons inhabiting frontier regions who by reason of sex, age or other causes are unable themselves to take out licenses and hunt and kill their annual quota of game, must be specially provided for by law.

11. Every community large enough to contain a post office should be established as a game-protection centre, or unit, and a deputy game warden should be appointed for

each centre, to whom an annual salary should be paid during satisfactory service, no matter how small the salary might be.

12. The duty of every such deputy game warden should be to issue hunting licenses, check up the reports of license holders, and generally promote and be responsible for the observance of the laws affecting game.

13. The cold-storage of legally-killed game to promote its full utilization by the holders of hunting licenses, beyond the regular season for hunting, is desirable and necessary.

14. It is time for the Governments of Canada and the United States to stop all killing of female hoofed game, other than caribou, by Indians, by prospectors, and by all other persons.

15. The waste of game should, under certain fixed conditions, be made a penal offense.

16. Regulations should be framed to require the reasonable salvage of game meat by sportsmen.

It would be placing a very low estimate on the mental fertility of Canadian and American law-makers to assume that it is *impossible* for them to provide a share of caribou meat and snow geese for the widow and the missionary without the sale of game. To the lay mind it seems entirely possible to work out a scheme for having a certain amount of *hunting by proxy*, under special licenses, prepared and issued to meet such cases. The game warden or his deputy, or in their absence some other government officer, could determine the merits of each application and exercise the discretion of issuing or not issuing a license to hunt by proxy. The holder of such a license could be relied upon to find a suitable person to act as a proxy, go out and make the kill and haul in the meat, for a daily wage consideration. Such proxies should not be issued to persons able to hunt for themselves: and the transfer of game by barter should be treated the same as the sale of game.

The feeding of the refuse portions of game to sled dogs should be provided for by law and regulation, rather than be permitted to continue unchecked in the total absence of regulations.

In the issue of licenses, the family unit should constitute the basis of issue. Any law which like those of certain western states of America provided for the issue of a full hunting license to each member of a family would be a mistake, and occasionally would lead to heavy slaughter.

A hasty survey suggests that with a liberal

bag limit, one hunting license to four persons of one family would not be very wide of the mark. The bag limit of our Alaskan game act permits the killing of two moose, five caribou and three mountain sheep, which is certainly enough of fresh meat for four persons for four months, if it be *properly utilized*.

The Nova Scotia law that forbids sportsmen to leave large quantities of good meat to spoil in the wilderness, or to be devoted to the maintenance and increase of predatory game-destroying wolves, is an excellent law. Ethically, no sportsman has any special right to waste good, edible meat in hungry lands. Let the salvage of meat be a part of the price that the sportsman pays for the privilege of pastime slaughter of valuable food animals.

In response to the demand of the people of Fairbanks, Alaska, and others nearer home, that the sale of game privilege be greatly extended throughout northern Alaska, we reply that the time has come for a new Alaskan game act which will completely stop the sale

of game, and provide for a safe and sane system for the better utilization of the wild game of that territory. We have suggested to the Fish and Game Club of South-eastern Alaska, of Juneau, that an unofficial commission be assembled, to consist of five persons, three of whom shall be residents of Alaska, to consider all the facts and proposals available, and evolve a new Alaskan game bill. While that proposal has met with some favour, its future is of course uncertain. At all events however, it appears to the writer to offer the best approach to a new system of combined protection and utilization.

Alaskans are greatly disturbed by the destruction of valuable game by wolves, and they appeal insistently for governmental relief. That subject is of pressing importance, but is quite apart from these observations.

In conclusion, there is now every reason for advocating, in the rational utilization of game, prompt and thorough consideration, and firm and energetic action.

The Muskrat and Ducking Grounds

E. R. KERR

MANY years ago when ducking lands were plentiful, and trappers and outlaws few, Ontario marshlands attracted migratory water-fowl and induced them to breed and rear their young within our midst. This was due to the fact that the limited trapping of muskrat in those days did not materially reduce their numbers and the consequent result was little opportunity to ultimately suffocate and permanently destroy the main food and attraction, wild rice. Many good and law-abiding sportsmen, some of whom are members of private ducking clubs, have little dreamt of or discovered the reason why it was necessary for them to utilize valuable grains such as barley, wheat, oats, corn, peas and beans in order to induce their breeders to continue their visits to these lands during the spring of the year and thus supply a stock sufficient for sport with the shot-gun in the fall and open season.

Many complaints, North American in scope, now are made about the unsatisfactory shooting of ducks during the year of 1918 and all followers of the game, and authorities generally, concede the fact that the Migratory Bird Treaty has greatly increased the flocks of migratory water-fowl; yet we complain that this increase is not evident on many old and

reliable ducking grounds in Ontario. We have been giving entirely too much attention to killing and destroying; the reason is plain. The mild winter of 1918 is in part responsible but we must not lose sight of the fact that the ducks fed somewhere on natural foods and amidst natural environments and "somewhere" was where wild rice and other esteemed foods had been permitted to flourish and attract the flocks. On such areas we are informed of splendid sport.

The increase in the number of trappers, during the past few years, and continuous depredations of outlaws, during all periods of the year and the high prices of furs, particularly that of the muskrat, couple up the responsables for over-anxious and competitive slaughter of this fur-bearer with the result that the muskrats are rapidly vanishing in many places and noxious weeds and other undesirable growth are supplanting migratory water-fowl foods.

Historic Point Pelee, now a Dominion Park and Bird Sanctuary under the jurisdiction of the Dominion Parks Branch of the Department of the Interior and superintendency of Mr. Forrest H. Conover, protects practically permanently the muskrats and this little fur-bearer, so valuable to the maintenance of

marshlands ideally fooded and attractive to migration, will be permitted to increase sufficiently to clean up the silt that has degenerated this acreage and prepare the bogs for the reception of wild rice to swilly foundations. When trapping is necessary to protect adjoining private lands from burrowing or other damage same will be done by the superintendent and game wardens and other assistants, the skins sold by the government and the revenues utilized to maintain the Park in the interests of the people as a whole. The marshlands of Point Pelee, approximately three thousand five hundred acres, soon will undergo an amazing reconstruction of interest to the sportsmen of Ontario and when improvements eventually are concluded these marshes will prove an object lesson in revival of degenerated swamps into ideal migratory wild fowl haunts. Wild rice will be planted this year as many portions of the marsh have been cleared of noxious growth and prepared by the muskrats only by adequate protection for one year. Another year doubtless will pass previous to official trappings being conducted.

It might be well for the sportsmen of various

counties in Ontario to carefully consider the future of their ducking grounds and the possibility of future sport with the gun. Prohibiting trapping of muskrats on your marshes for at least two years and re-planting of wild rice will increase a valuable fur resource and, at the same time, increase the flocks to your favorite ponds. Open ducking grounds, where devastators and outlaws have full sway and swing, are rapidly degenerating and must pass into the regions of oblivion and, unless the brakes are immediately put on, the number of ideal public ducking grounds in Ontario and elsewhere will be reduced to a minimum possible of counting only on the fingers of one hand.

All of us must carefully consider the cold fact that the word "conservation" has taken on an entirely new meaning. The phrases "wild life protection or conservation" and "continuation of sport with the shot-gun" require definition and interpretation but, also, the patience and organization in each county of an effective force for the making of sane, sound and constructive laws and enforcement of the law.

Watch for Bands on Waterfowl

American Game Protective Association

This fall, it is hoped sportsmen will carefully examine all ducks killed, to ascertain whether or not any are banded. The American Bird Banding Association with headquarters at the American Museum of Natural History, New York City, the United States Department of Agriculture, Washington, D. C., and several individuals are making a practice of banding waterfowl, to ascertain their migratory lines of flight.

Wild ducks are trapped by those having permits and again liberated after having an aluminum band firmly fastened to one leg. These bands are numbered and also are stamped with the address of the person or association doing the work. A card index system is kept by those releasing the bird, listing all data in connection with each bird liberated. When the bird is killed, the gunner is requested to communicate with the address on the band, giving the number, species of duck and place and date killed. From these facts, it is very easy to determine the routes travelled by the birds, and as more and more

of this information accumulates, the more certain we will be of their exact movements.

To successfully protect waterfowl and to better shooting conditions over the country, it is imperative that we know more about the habits of these birds than we do at present. By some method, yet to be devised, we must know to a certainly as to increase and decrease. If birds are scarce in one shooting locality while they are plentiful in other sections, we should know the reason why. It has been proved that birds follow the same migratory routes year after year. Individuals and their broods winter and nest at approximately the same points each season and follow the same air lanes during migration.

Comparatively speaking, very few ducks nest east of Hudson Bay and the general trend of the migration of waterfowl is from the northwest to the southeast. The majority of ducks wintering along the Atlantic Coast are hatched in that vast area of marsh and prairie land lying west of Hudson Bay. The bulk of the ducks that nest within the bound-

aries of the United States from Kansas and Nebraska northwest migrate to the Mississippi Valley and the Gulf Coast for the winter. Their flight also has a southeastward tendency. California's ducks are supposed to come straight down the coast line in a direct southern flight. These conclusions have been arrived at by the gathering of much data by men who have devoted their lives to this work and in the main they are undoubtedly correct. However, there is much important information to be secured from tracing the lines of flight of banded ducks.

Just recently a banded duck has proved conclusively that occasionally ducks bear to the west in their southern migration. On October 20, 1918, Mr. H. S. Osler, 801 Dominion Bank Building, Toronto, banded and re-

leased an adult male black duck which he had trapped for this purpose at Lake Scugog near Port Perry, Ontario. This duck was banded No. 36932 Am. Museum, New York. That same fall, Harry Meier took this black mallard in the state of Michigan, near Marine City.

This bird had worked approximately 175 miles to the westward and only 90 miles to the south on the 200 mile migration. It seems probable that had not this duck been taken, its line of flight would have been down the Mississippi Valley, by way of Kankakee, or to the Wabash and Ohio and then along the Mississippi to winter either among the many birds using the swamps and marshes along this river, or to continue the trip on down to the delta and gulf coast country.

Federal Game Laws Enforced

Canadian sportsmen will watch with interest, the fight being waged by the Game Protective Association in its endeavor to make the game law offenders live up to the terms of the Migratory Bird Treaty. The latest bulletin received from the American Game and Protective Association states:—

"Eighty-three violators of the Migratory Bird Treaty Act have already been convicted under fourteen United States District Judges and two hundred and forty-one cases have been filed for prosecution. We have been informed by the Biological Survey of the U. S. Department of Agriculture that these cases will be presented to the courts and disposed of as rapidly as possible.

"Among those in waiting is the Attorney General of Missouri, who is under \$1000 bond, pending his trial. The chief law officer of Missouri and several of his friends were arrested at their private club and seventy-six ducks and one goose seized as evidence.

"The only place where an organized fight is being made against the law is at Kansas City, Missouri. A demurrer was filed, alleging the law was unconstitutional, in the case of De Lapp and Samples, two Kansas City

gunners arrested February 25th for shooting ducks after the Federal season had closed:

"This case was hailed as the "test case" by the newspapers of the Middle West, and those favoring spring shooting gathered to the defence of these men. The best of legal talent was furnished them gratis, and the public has been assured that the case will be appealed and a United States Supreme Court decision secured as quickly as possible, no matter which side wins in the District Court.

"Shortly after the arrest of the Attorney General on March 6th, he, with his assistants, joined those attacking the law. In the name of the State of Missouri, an injunction was asked for restraining U. S. Game Wardens from enforcing the law in that state. Kansas also joined, through her attorney general, and this restraining order was argued on April 21 and 22, at the same time as the demurrer in the so-called test case.

"A decision is expected at any time and those favoring the law feel that if the opposition cannot win with their present array of counsel, there surely is no merit in the claim of the spring shooter that the law is unconstitutional."

Amendment to Migratory Birds' Act

Probably the most important change which has taken place in Canadian game legislation this year is made by one of the 1919 amendments to the Migratory Birds Con-

vention Act. This amendment allows the Governor in Council to make regulations for limiting the number of migratory game birds which may be taken by a person in any speci-

fied time during the open season. Regulations providing for the manner in which migratory birds may be taken and the appliances that may be used in taking them can now be provided for under the act.

In order to enforce these new regulations, as well as the ones which have existed previously throughout Canada, in such a way as to keep our promises made in the Migratory Bird Treaty, the Dominion Parks Branch,

Department of the Interior, requires the voluntary assistance of sportsmen throughout the country, especially those located in districts where game birds are abundant.

It is proposed to make a number of properly qualified sportsmen honorary wardens to assist in the enforcement of this Act. Will you help game conservation by assisting in this good work?

International Conservation Meetings

At a joint meeting of the Executive Committees of the International Association of Game, Fish and Conservation Commissioners, and the American Fisheries Society, held in Washington, D.C., June 3rd, it was decided to be for the best interests of both societies that the next Annual Convention be held in Louisville, Kentucky; the International Association of Game, Fish and Conservation Commissioners to be held on October 6th and 7th, and the American Fisheries Society on October 8th, 9th and 10th.

On account of central location these conventions will undoubtedly attract large and representation delegations from all parts of the country and private game and fish breeders, commercial fishing interests, officials, anglers and sportsmen should all be largely represented.

Honore Mercier of Quebec, is Vice President and Hon. F. G. MacDiarmid of Toronto, a member of the Executive of the International Association of Game, Fish and Conservation Commissions.

The Keeper of the Forest

(To G. W. Bartlett, Superintendent Algonquin Park.)

G. W. Bartlett

The Woodsman—big and wonderful is he,
As the great heart of Canada he keeps—
The heart of woods and lakes and rocks and
streams,

Where Nature's glory undiscovered sleeps.

This is his task—the task he loves so well,
And every flower looks up and knows his
face,

And every tree by him is understood—
He shields the shyest wood-life's hidden
place.

He holds each mound of moss a miracle,
Each unnamed leaf a study for the mind,
And every mood of water, woods or sky
The most exquisite mystery man may find.

And thus in ways all beautiful and wise,
He sees the wonder-working Hand of God
And walks with reverent steps and tender eyes
Such beauteous paths as man has ever trod.

Amy E. Campbell.

Nimrods

M. FOSTER

THE packing and talking went on lazily in the smoke filled room. As they were leaving early in the morning, it was absolutely necessary that they finish packing. A lot of conversation, however, could easily have been dispensed with, for the trip had been thoroughly talked over and the plans cut and dried long before fall. Cliff claimed that making the trip later in the fall would be much better, for game would keep. Mac agreed, so later it was, being the 20th of October. In spite of the stipulation that there was to be no calling on their best girls last night, around nine o'clock Mac found he had to make a trip up to Ninth Street. Straightening up from over the grub box, the most important part of the packing, he went over to the glass, made a few hasty passes at his hair, and snatching up his hat, hiked off.

"Hey, there, where you going?" Cliff yelled after him.

"Got to get another box of shells," Mac answered shortly, "be back in half an hour."

Cliff sat on the bed and gazed at the closed door, his jaw sagging. "Shells," he snorted suddenly, eyeing the pile of boxes on the floor. "Like hang!" When Mac returned two or three hours later he found Cliff sound asleep on his bed, the cigar burned down to his lips. Rousing him gently with the toe of his boot, they put the finishing touches onto the packing and crawled into bed around twelve o'clock.

There was some hustling done next morning for they had risen later than they intended. The train left Edmonton at six o'clock; they left the house at ten to six—needless to say they left without breakfast. Mac puffed along shoving a rickety two-wheeled cart, trying to take two loads in one. The fox-hound led Cliff along with his bundle. As they drew near enough to the station to hear the conductor bawling "All Aboard," the cart wheel could stand the pressure no longer, so the rim broke. With a few hot words they abandoned the cart, and taking the grub box between them and each grabbing up an armful, they hurried on, feeling certain the train would not wait for them should they fail to arrive within a short time.

Mac shoved the unchecked grub box and tent roll up on the steps. The conductor shoved it back—"Freight's on the other side,"

he growled. Mac glanced up quickly, his eyes gleaming balefully. He muttered something unintelligible and shoved it back on; some change passed over and it stayed there. He then shoved the dog into the baggage car; the baggage man promptly shoved him back again. "Too late," he announced cheerfully. His palm was also oiled and he drew the dog in, remarking on his many fine points.

When they reached Wabamun and the engine with its long string of cars had snorted disdainfully up the track, leaving them standing on the platform, the dog hearing a shot and taking it for his starting orders, started, and he too left them standing there. The last they saw of him was a quarter of a mile away, going strong.

Lake Wabamun, the Indian word for "looking-glass," did not in the least resemble a looking glass that day. The water reflecting the dark, sullen, grey clouds overhead was rising and falling sluggishly with the wind that had risen. Cliff stood looking down at the fourteen foot canoe which looked rather small for the amount of baggage piled up on shore.

"Darn good thing the dog beat it," he remarked cheerfully. "As it is I'm afraid I'll have to leave my tobacco behind to make room." Mac did not answer; he was ruefully thinking of the twenty-five dollars he had paid for the dog. They got in and paddled slowly down the lake, making for the narrows. The canoe did not bound lightly over the dancing waves—it was too heavily laden.

"Hey," Cliff yelled from his end of the canoe, "let's get out on this point and try loading this junk over again. I'm getting a game arm." It was hard paddling against the wind, and Mac agreed with alacrity. They got out, reloaded the canoe with great care, and then held a council to see whether they would be sports and go on, or wait until it had calmed down somewhat. But sports they were, so climbing in they set out, only to wish after going a quarter of a mile that they had camped awhile on the point. The wind was rising steadily and cold wind it was, carrying with it hard, stinging snowflakes and to make matters worse, water occasionally lapped in over the edge of the canoe.

Mac sat humped up in the stern, paddling doggedly. Both were silent. Mac glancing up beheld Cliff reach around gingerly into

his hip pocket, fish out his plug of chewing tobacco, then without taking a bite, gingerly replace it.

"I hardly think that shifting the cud in your mouth would upset us," Mac said sarcastically. "That is" he added "if you are very careful."

"It wasn't that," Cliff answered gravely. "I would hate to have my folks find my body with a chew in my mouth after thinking me their white-haired boy," Mac grunted.

After paddling hard for an hour they landed and made camp in a sheltered spot. Courage returned after having something to eat and some good hot coffee. A calm, peaceful feeling settled over the camp as they sprawled smoking around the fire. Although it was Sunday and no shooting allowed, they put their guns together and kept a wary eye out, for one could never tell when wild geese or ducks would swoop down in savage attack, destroying the peaceful atmosphere about the camp in the pines. But the geese and ducks, apparently sensing their presence in that neck of the woods, wisely kept out of the way. A large eagle, however, flew over, and Cliff grabbing up his shot-gun, or as he expressed it, "slobber tube," fired at it. The eagle fell in the lake, raising it, Cliff swore, fully a foot. Launching the canoe, they brought it in, and measuring with the gun found it to measure eight feet, as near as they could make it. One of Mac's brilliant thoughts came to him and he acted on it; taking the eagle, they tacked it on the bow to keep out the water.

Then as they had about five miles to go down the lake to the portage where they wished to spend the night, they started out to try and make it before dark. Upon reaching Goose Quill Bay they found it covered with ice where it was sheltered, and in trying to break through, punched a hole in the canoe. Cliff, with great presence of mind, stuffed his handkerchief in the hole and tried lowering the water which had been pouring in, by bailing with a cup, then snatched up a frying pan and bailed in earnest, while Mac doubled up like a jack knife and paddled in earnest for shore. They reached shore all awash like a submarine and drew the canoe up. Mac stood there and cursed Cliff roundly, (having in the excitement neglected to do so) for persuading him to make the trip so late in the fall. Their blankets were soaking, and as a matter of fact, everything else was in the same condition. They packed the outfit up to an old shack which

had been devoid of human habitation for many moons. Climbing up on the roof, Cliff chopped a hole to let out the smoke, while Mac rustled around for dry wood to make a roaring fire in the centre of the shack. After cleaning out a portion of the rubbish they brought in some spruce boughs for their bed, then lying around, had some target practice with the twenty-two, shooting at every conceivable object that presented itself as a suitable target.

In the morning they hunted up a Scotchman with his ox-team to pack the outfit across the portage to Low Water Lake. There were oddles of chickens in the grain field. The Scotchman "didna hae a gun," and would be greatly obliged if they would shoot some for him, so reluctantly dragging out their guns, they bombarded the field. They were treated right royally at the Scotchman's house, and Cliff falling madly in love with the handsome wife, caused Mac some anxiety, and it was with difficulty that he was finally dragged away.

Upon reaching Shoal, or Low Water Lake, they found ice on it, but hearing geese honking down the lake thought there must be open water and they waited impatiently, Mac in the meantime going over his former remarks and adding a few more here and there about making the trip so late in the fall. The wind soon cleared the ice, also making it necessary to follow the north shore. Low Water Lake was quite a large body of shallow water with deep mud in the bottom and reeds growing about the shores, there being only three or four good landing places. There were quite a few geese on the lake but owing to the rough water and small canoe, they scored many misses on their way down.

The Island was reached late that night and after hunting around some time they found the weed covered landing, and both being solicitous for the inner man, they hurried on a roaring fire and prepared some eats. The tent, being wet, was not put up; they were too cold and tired to even pick goose quills for their bed, and when they did try to sleep, they could not. For there appeared to be hundreds of geese feeding about the Island and the din grew so loud that around two o'clock they got up, fired a couple of shots in the general direction, gave two or three blood-curdling war-whoops, then ominously threatening much more for morning crawled shivering back into bed. In the morning, however, the geese were not so boisterous, nor were there any in evidence in any direction when the two mighty hunters sat in their blind just before daylight, their teeth chattering loudly. Just before giving up their futile vigil they noticed some birds flying over the lake and although two miles from main land, these proved to be prairie chicken. They managed to slaughter half a dozen and beat it back for camp and breakfast, and as they sat around their camp fire shortly after, flock after flock flew directly over their former hiding place. Jumping up with one accord they cursed heartily, but unfortunately were too far away to be effective. They did not linger long on the Island for there was danger of being frozen in, so they paddled for main land and from there hiked down to the farm to get someone to haul their outfit down to the Saskatchewan, four miles away. Arriving at the river, and thinking their boat altogether too small to take a chance on running the curly water, they fixed it up by placing a dry spruce log on either side with a rope underneath to hold them, and then replenishing their grub box somewhat, started on their way rejoicing.

They went on rejoicing as far as the Coal Arch and there found they were sailing much lower in the water than they had upon starting, and consequently were sitting in a good deal of water. They reached shore partly submerged, and camping on a mud flat, dried their things and lugged out logs for a raft. As they did not work overly hard, and "eat, drink and be merry" was their motto, it was noon the next day before they started out, one on the raft and one in the canoe. Ducks rose now and then and at times circled near enough to commit suicide. Three miles farther on, coming to a likely looking flat for chicken, and thinking the farmer might be

friendly, they landed and sauntered across a field, killing fifteen going half a mile, and eleven coming back, the whole procedure taking an hour. They then went on to another likely looking place and the road being near the river, it was agreed that they separate, taking opposite directions. Mac was bagging them right and left until his shells gave out; Cliff's slobber tube, as far as Mac had heard had been strangely silent and going in search of him, he found him sitting on the river bank swinging his foot lazily and looking wise.

"Where's your birds?" Mac asked suspiciously. Cliff leaned over and carefully spat at a small twig which flipped to and fro in the edge of the water. "Ain't none," he drawled indifferently. "Did shoot one but it flew off somewhere." He waved his arm vaguely. "Met a couple of fellows with a jug and after taking a couple of snorts thought I had better beat it back to the raft while my legs were good."

Piling onto the raft they went on again, arguing earnestly about the chicken they might have had if Cliff had not met the two lumber jacks with their jug. That evening when looking for a good place to land, they spotted a couple of coyotes on a sand bar. Mac dragged out his long barreled Ross, the bullets being packed in salt to the meat from becoming high, and syringed down on one, and after three attempts managed to make him stay put. They hauled the skin off, rejoicing greatly over the three dollars earned, then made a big white man's fire for warmth with a small one to cook on. Cliff took up the axe and scrambled slowly up the bank. "Goose quills tonight," he grunted. "I'm too dog-gone tired to get ostrich down." When he was gone Mac made a bannock and cooked some partridge. That night they crawled from their warm bed into the chilly night air three times to try and get a deer that came around camp. Mac loaded his shot gun with the intention of sneaking up pretty close, resting the gun on its tail, and blowing its head off, but one might as well have thrown by hand as to try to shoot a deer with a fox gun loaded with buck shot. Upon looking for the deer next morning they found it had vanished completely. It was so cold they had to keep moving; cutting some spruce boughs, they draped them artistically about the raft for a blind and lay there scarcely breathing, waiting to assassinate some mallards, for they were never out of sight of them; all

the way down they had seen large flocks, and as they rose, they shot holes in them.

Grub was getting scarce. Instead of letting out their belts after every meal, they tightened them. They had figured on making town in three days, but three days were gone already, and they were still a long way from town. They made a pair of oars and started to put on speed.

At the mouth of Weed Creek they thought they would have a change of diet. Two miles farther on there was a path leading up the hill from the river and they flipped a coin to see who would follow the path to see if there was a homesteader at the other end of it. It fell to Cliff, and taking his shot gun, he hiked off up the path and after walking until his legs threatened to give out, he came to a deserted shack, the windows being boarded up. The path led on past and Cliff went on another half mile and came upon an ideal homesteader's shack in a small clearing. He heaved a deep sigh as he saw the open door and the thin wisp of smoke curling up from the battered stove pipe. A fierce, hungry-looking mongrel dashed out and without preliminary sparring seized him by the pants' leg, and subsequently near dropped dead, but Cliff was wise and he knew if his gun went off in the dog's direction he would not get anything to eat, so he spared the dog, fervently hoping he would follow him out of the clearing. He managed to get two small loaves of bread, half a dozen eggs, and a pound of butter. The dog became quite friendly, but not friendly enough to go part way back to the raft with him. Mac had some chicken and a couple of pails of water boiled. Although the bread looked like the mischief, it tasted better than they had expected, and getting extravagant, they cleaned up on everything but the butter, then went on down stream quite content.

That night Mac cooked a couple of partridges and they had a crust of bread or two. They figured on being in town next night, but striking a stiff head wind, found they couldn't make it, and had to camp at Big Bend. Everything, the tobacco included, was getting alarmingly low and after a slight breakfast before daylight, the ducks were so thick they could not resist the temptation, so down into the blind they went, and as a result did not make good time. At three o'clock, thinking they could go no further on an empty stomach, they landed and hurried some chicken into the pot, and with a little overlooked flour, made some dough-boys to

put on top. It did taste very good and they could easily have dispensed with three times as much. Cliff tightened his belt, sighed dismally, and commenced rummaging in the grub box.

"Great old Snakes!" he ejaculated. "Here's a piece of cheese!" He snatched up a neatly wrapped package from the bottom of the untidy grub box. Mac started up, his face brightening. "Gawn," he jeered, falling back gloomily. "I eat the last of that cheese, I'd swear to it." Cliff was unwinding a towel. "Maybe it's cake," he said, briefly. Mac's eyes were watching the unwinding like a cat watches a mouse. The last turn came off quickly, revealing a perfectly good bar of unused soap. Two jaws dropped simultaneously. "Well, I'll be dinned." Cliff heaved the offending soap as far as he could into the river. "Now who in thunder put that in to take on a hunting trip?" And judging by appearances it could easily be seen that soap had not been used very frequently. "We should worry, we'll be home and have some of Mother's cooking tonight, anyway." Just to show he didn't care about the piece of cheese he flung the tea pail up and filled it full of holes; other camp articles met the same fate; there was nothing eatable left; he even dumped out a little tea that remained.

Hustling onto the raft and canoe, they rowed for all they were worth to make home and Mother's cooking that night. But alas! they ran into a very large flock of ducks. Mac swore there were a thousand more than they had seen all the way down the river, so into the blind they went, disguised as spruce

boughs. When the smoke from the bombardment cleared away they found three ducks. After chasing a green head a couple of hundred yards Mac got Cliff off the raft and they went on shore to limber up.

Say, Mac, what in the dickens is that swimming down there?" Mac did not pay much attention, thinking Cliff was "seeing things." "Too big to be a dog or coyote," Mac looked. Down the stream a deer was swimming for their side. Mac, who had the misfortune to break his suspenders while chasing the green head, handed his rifle to Cliff to go meet the deer, while he shot at some ducks that were flying up and down the river in clouds. Upon reaching the bank he hitched up his waders and stood legs far apart to keep from being exposed to the chill October weather. His shells were heavy loaded with 28 grains of ballastite and he shot, pulling a couple of green heads out of the clouds.

"Some shooting," a voice broke out at his shoulder, and glancing around he beheld Cliff taking in the shooting. "What in blazes are you doing here?" he snapped. "Get after that deer." And Cliff awoke to the fact that the deer had reached shallow water and was standing shaking himself. He drew a fairly good bead and made gravel fly two feet on the other side. Next shot hit near his feet and by that time the deer got very anxious to be on his way. Before he disappeared however, Cliff managed to get a small lock of hair for a souvenir. Mac waddled up, holding trousers up with one hand, his gun in the other, and cussed Cliff for a rotten shot. They piled onto the raft again, feeling rather blue. There was a strong head wind blowing; moreover it had started to snow, and it was so

cold they had to stop rowing and paddling to swing their arms.

"Well," Cliff remarked with assumed cheerfulness, "if this weather keeps up there will be no danger of our game spoiling."

"No," Mac retorted sarcastically, "there won't."

Although they were only ten miles from town they decided they could not make it that night, and after dark they pulled for shore. It was very cold and wood seemed scarce. Someone evidently was clearing a subdivision in the Edmonton district. They finally found a few dry branches and hung their blankets around the fire so they would be warm, if not dry. The tent was frozen so hard they had to tramp on it before they could put it up. Tightening their belts up another notch they turned in, waders and all, pausing only to take the shells from their coat pockets.

Next morning they found a couple of inches of snow on the ground, and bundling the outfit together as well as they could, they hit out, making two miles before they had to land and warm up. They went on another two or three miles and landed again by an old sawdust burner to get warm. Upon reaching town they drew the canoe up on shore and beat it for the house, thanking their stars they did not have far to go. Cliff's sister, shaking rugs at the door, thought they were tramps coming for a hand-out. While Mac explained politely that they were not tramps, Cliff asked with brotherly frankness for the hand-out, also asking that there be no delay in placing it before them. He heaved a deep sigh and turned to Mac.

"When we are finished we'll just slide under the table and go to sleep."

TWO CANADIANS ON CHESAPEAKE BOARD.

At the annual meeting of the American Chesapeake Club, held at Mason City, Iowa, July 8th, the following officers were elected.

President, Earl Henry, Albert Lea, Minn.; Vice President, A. A. Felt, Mason City, Iowa; Treasurer, M. S. Barron, Mason City, Iowa; Secretary, W. H. Orr, Clear Lake, Iowa.

Board of Governors.

F. E. Richmond, Calgary, Canada; Wm. B. Maercklein, Danzig, North Dakota; Dr. W. D. Jones, Devil's Lake, North Dakota; Henry Steers, Findlater, Canada; John A. Considine, Marfa, Texas; Joseph Pulitzer, Jr., St. Louis, Mo.

This meeting was perhaps the most enthusiastic gathering of Chesapeake Breeders on record. Members travelling as far as fifteen hundred miles to attend.

SMALL MOUTH BLACK BASS PLANTED.

Brockville, July 23.—100,000 small black bass, ranging in size from an inch and a half to three inches in length, were turned loose into the River St. Lawrence to-day in various feeding places, all within two miles of Alexandria Bay. They were taken there by an agent from the State Hatcheries at Ogdensburg, who was accompanied by F. L. Raymond, one of the leaders of the Anglers' Association of St. Lawrence River.

A. BOURCHIER

AT eleven, Murray Becker was the oldest of a family of five. He was tall for his age, slight of build, and long of feature. His hair, which was coarse and shaggy, was not unlike in color the tawny freckles that bridged his Roman nose. Not a lad to whom you would give more than a passing glance, unless perchance, you caught the glint of his steel grey eyes from whose wistful depths shone a light of intelligence, much out of keeping with the boyish countenance.

But Murray had been trained in a hard school. Ever since he could remember, he had been nurse-boy, chore-boy, errand-boy, and every other boy around home. His parents were very poor. It took all his father could earn, and more, to keep the family on just the mere necessities, so, to even get books and decent clothes for school, the lad had to turn out holiday times and Saturdays and earn what he could by doing odd jobs for the neighboring farmers.

One Saturday, late in the fall, Murray was helping Sam Crone, a neighboring farmer, to take in his turnips. All day, a raw, damp east wind had blown, and just when they had finished for the day, and were going in for tea, a heavy rain set in. Not thinking it wise for the boy to start home through the rain and darkness, the farmer told him he had better stay the night. At first the lad de-

murred, but when he went out and encountered the driving rain, he decided he would stay.

Drawing up an easy chair before the spacious fire-place in which a bright roaring blaze licked around an old pine root, the farmer bade the boy to make himself at home, flinging as he did so, a large packet into the lad's lap.

"There," said the farmer. "is Hallam's fur price list, just came in from the mail, look it over for a few minutes if you care to, while I glance through the 'Globe,' and then I'll skin you at a game of checkers."

Murray did not know what a fur price list was, but anything in the line of reading matter was always welcome, so, opening the large envelope, he proceeded to examine the contents.

Of tags, memos, etc., there was a plenty, but the boy saw nothing of interest to him until he opened the list of quotations.

Skunks, \$2.50; \$2.00 and \$1.50; was the first item that struck him.

Wondering of what good these stinking little wretches were, he ran his eyes on down the list until he came to muskrats, for these, Hallam was offering from fifty to eighty cents.

Never before, did Murray know that muskrats were worth anything. Of what good were they anyway; did people eat them,

he wondered. Why, he knew where there were heaps of muskrats. The little creek that came from the big marsh, and ran along at the foot of the hill on which their house stood, was just alive with them.

Hoping that Mr. Crone might be able to tell him of what use muskrats were, he waited until the farmer laid down his paper, then he went over to where he sat and asked him what Hallam did with muskrats, that he would give such prices for them.

Taking off his glasses, the farmer looked enquiringly at the boy.

"Why, my lad, don't you know what muskrats are used for," asked the farmer.

"No, sir, I never knew they were any good at all until I saw this paper," replied the boy.

"Well! well! well!" exclaimed the farmer, "I guess instead of playing checkers, I'd better be telling you something about muskrats."

"Geel! I wish you would," said Murray, his face beaming with eagerness.

Drawing his chair up to the grate, the farmer told the lad all he could about the muskrat; why they were caught and killed, and of all the fine furs that are made from their soft, brown skins.

"And do you think I could catch any," enquired the boy, when the farmer had finished.

Now in times gone by, Mr. Crone had been a great hunter and trapper and many a fine mink, fox and rat had fallen prey to his skill. Rheumatism had come his way, however, and so of late years he had given it up. But the boy's eager questions, brought back to his mind a time, long years before, when as a boy he had been given his first trap by an old trapper friend, who had kindly gone with him and shown him where and how to set it, and great, too, had been his delight when upon going to the trap one morning, he had found a muskrat in it—his first muskrat. Now, in his turn, he would pass on to the boy what the old trapper had passed on to him.

They talked muskrats and trapping until bedtime, by which time it had been arranged that Murray was to come over the next Saturday, and go with the farmer to the creek for a lesson in setting traps.

The days of the following week passed slowly to the boy. He did not say anything to the folks at home about the plans he and the farmer had made for fear they would laugh at him; but all the same he cherished hopes, that the trapping scheme would be successful; and visions of many things he

would like to have—things he soon would have if he could but get a few muskrat skins to sell—danced before him.

Saturday morning came at last. After doing up the chores around home and running an errand to the village store for his mother, he dug off, and was soon at the farmer's, who was just in the midst of his noon-day chores when Murray arrived. The boy pitched in and helped him, and by the time Mrs. Crone called them to dinner, everything was done up spick and span, ready for the afternoon's trip.

Dinner over, the farmer and the boy set out for a small stream some two miles from the farm. It was the same stream that ran past the boy's home, but the farmer aimed to hit it a mile or so farther up and work down, setting the traps as they found suitable places to do so.

They had scarcely reached the stream when they heard a loud splash. Looking in the direction from whence the sound came, the farmer saw the wake caused by a muskrat swimming under water. Running as fast as he could for twenty yards or so, cocking his old muzzle loader as he ran, the farmer caught sight of the rat and let blaze into the water, hoping to bring him up. But the water was too deep, and by the time the commotion in the water had cleared away, the rat was nowhere to be seen.

"Well the rascal got away that time," said the farmer, "but we'll look around and perhaps we'll be able to get him yet. He no doubt lives around here somewhere."

They searched the banks but found no further signs of rats until they came to an old cedar stump, from under which the spring freshets of many years had washed most of the bank, leaving a roomy cavity, guarded in front by a mesh of knarled old roots and brush. Here, there were signs in plenty. All about were innumerable broad footprints, and here and there could be seen a shallow furrow, made by a muskrat dragging his tail through the soft mud. Further back under the stump, was a goodly bed of grass and cress to which the rats gained access from the stream by diving deeply under the barricade of roots.

"H! h! h!" said the farmer "here's a place where we ought to get one or two if we are careful."

Sorting over the half dozen traps he had brought with him, the farmer picked out the one with the longest chain, explaining to the boy as he did so, that in making a set

under the stump it would be necessary to stake the trap securely in order that the rat when caught could not crawl away with the trap, and hide up in the roots and brush.

"But why the one with the longest chain," asked the boy.

"Oh! that's so the rat will be able to get where the trap will drown him. If the chain's too short the rat will twist it round the stake until tight, and then chew off his leg and escape," explained the farmer.

Having set the trap, the farmer placed it in a small corner away back under the stump where the water was just deep enough to cover it an inch or so. Behind it, and far enough back so that the animal would have to cross the trap to get it, he placed a few slices of parsnip—the bait he always used—and then staked the trap as near the deep water as the chain permitted.

"A likely looking set," said the farmer, surveying his work.

A little farther down the stream was a thick bed of water-cress, where from all appearances the rats made a feeding place, and through which they had made a clear runway. Here the farmer set another trap, baiting it as before with the parsnip, only in this case he put the bait on the end of a stick which he stuck in the banks suspending the parsnip about eighteen inches above the jaws of the trap so that the rat, in attempting to get the bait, would get caught by the hind foot, thereby lessening the danger of the animal chewing off its toes and getting away. He did not stake this one either, just made a loop in the chain through which he drew a good sized stick, explaining to the boy, that on small streams such as this where there was little danger of the water washing the trap and stick very far, it was best to just fasten the trap to a drag so that the rat could get to deep water where it would soon drown.

Musk rats seemed plentiful along the little stream—at any rate good places to set traps for them were—so by the time it was time to get home to do the night chores, the farmer had made six excellent sets for the boy.

Arrangements were made for Murray to visit the traps the following day, and on Monday night after school, then to report to the farmer, bringing with him the two days' catch for a lesson in skinning.

Sunday morning Murray was up bright and early, and after choking down a few mouthfuls of breakfast was off for his usual Sunday morning walk, which took the form this time of a visit to the traps.

The first two sets the boy visited were just the same as they had left them the day before. The third one which had been set at the foot of an old elm was nowhere to be seen. Wondering what had happened to it, he proceeded to hunt for it along the banks. He had not searched long however, when he saw the slab to which the trap had been fastened lying on the surface of the water a few feet from the bank. Reaching out as far as he could he grasped the end of the slab and hauled it ashore, bringing with it the trap with a good sized muskrat in it, which, having been able to reach deep water, had drowned.

Murray reset the trap in the same place as before, and then hurried on to the others, none of which had been molested.

Monday afternoon, as soon as school was out, the lad was off to the traps. He found everything as he had left it until he came to the one set in the cress. This one was pulled away out on the bank with a big live rat in it, which bit and tore fiercely at the trap, chattering all the while.

At first, Murray was a shade shy of the furious little chap, for every time he got close to it, it would dive viciously at him, snapping its teeth ready to take a piece out of him, if by any chance it should get a hold. Finally a well directed blow between the ears finished its activities, and Murray hastened on to the last trap—the one under the stump—which was sprung, but had nothing in it.

The farmer had stretching-boards ready, and when Murray arrived with the two rats, he had them skinned and stretched in short order. The pelts were prime and well furred and much was the lad's delight when the farmer told him they were worth at least sixty cents apiece.

At home that night, Murray told his parents all about the trapping, and how he hoped to make a lot of money that way. At first they laughed at him a little, but when he showed them the two dandy pelts he had already taken, and told them what the farmer said they were worth they became really interested, and encouraged the boy to go on and do the best he could.

Murray tended his traps very faithfully, and by the time winter set in with its deep snow and frozen streams, he had taken eighteen fine skins. These he sold to a passing trader for twelve dollars.

Trapping on the streams was now impossible, so upon the advice of the farmer Murray took his traps and set them around

the muskrat houses, of which there were dozens in the big marsh near his home. Here he worked them with fair success until the floods of early spring cleared the streams of ice.

The spring season passed all too soon for Murray, who was having better luck with his traps as he gained experience in their use. He had done very well however, and when at the end of the season he received a cheque for twenty dollars for his catch, he was more than satisfied.

Summer had come and gone, and it was trapping time again, Murray planned on doing big things this season. Weeks before the season opened he had gone over his territory studying the habits of the muskrat, and spotting out all likely places to catch him. The farmer had given him another dozen traps too; which with the ones he had from last year would set a line just long enough for him to look after nicely. Prices were good too, and everything pointed to a very successful season with the traps.

One evening, some three weeks after he had set his traps, Murray was sitting by the fire looking over the local paper, when an item of news caught his eye, which set him thinking. It ran somewhat as follows:

"The Jones Hardware Co. will give a Steven's twenty-two calibre rifle, to the person catching and placing on exhibit in their store, the largest mink. Contest to close December the twenty-fourth."

Now, a rifle was something Murray had wanted as long as he could remember, but money had always been too scarce for him even to think of getting one. Here, however, was a chance for someone.

Mink, he knew, were quite plentiful in the locality, but he had always heard that they were very cunning and hard to catch, so had never tried to trap them. Then, to set traps for mink, would mean that he would have to take some traps off his muskrat line, and they were paying so well just then that he hated to do that. Doubtless, too, there would be many after that prize who had trapped mink for many years, so it would be utter foolishness to risk the lessening of his catch of rats, on the chance of winning that rifle.

Thoughts of the rifle and mink trapping stuck in his mind all the same, and one night soon afterward he dreamed that he was walking along a little creek through a sparsely wooded lot not far from home, known as the half-bush, when a monster mink jumped out of the water and ran under

an old stump not far from the bank. Setting a trap just outside the hole where the mink had disappeared, he hid behind a tree and waited. In a few minutes out came the mink and walked right into the trap. My, but it was a big one, and thoughts of the rifle went dancing through his mind.

"Murray, it's breakfast time," called his mother, from the foot of the stairs, and Murray awoke from his dream.

Rubbing the sand from his eyes the lad hopped out of bed and looked out the window, and, lo! before him lay a world transformed. Snow had fallen during the night, and where but a few hours before, the landscape lay all brown and sere, now as far as eye could reach all lay mantled in a shroud of white.

"Don't suppose there'll be anything in the traps to-night" thought Murray, as he hurried home from school that afternoon. Nevertheless, he didn't feel right until he had visited them all.

It was getting late when he reached the last one and turned for home, so instead of following the creek back, as he usually did he took a short cut across the fields. The course he followed took him through the half-bush of his dream of the night before so just for curiosity he made a slight detour to visit the old stump; and would you believe it? Just as he was about to cross the stream, that ran between him and the stump, a great big mink, the biggest he had ever seen, sprang out of the water and ran under that very stump.

For a moment the boy stood paralyzed. Then remembering the happy finale of his dream, he hurried over and set a trap in the very hole that the mink went in, and then sat down to wait.

But, alas his dream came true just so far; and he waited, and waited, and waited, but no mink came out.

The next night when he visited the stump, Murray found that the mink had been out. Tracks were thick all around. The mink had gone in and out under the stump at a dozen places but at the same time it had kept mighty shy of the trap.

For two long weeks did Murray try to catch that mink. He tried every ruse he could think of to lure him into a trap, but all in vain. The mink would come out; run around; hop over the trap if he so chose; but never did he take the fatal step that would have landed his hide on a stretching-board. As day after day slipped by with no success, Murray saw his chances to win the much

DU PONT CANADIAN INDUSTRIES

The Shooter's Instinct

THE man who shoots soon comes to know by instinct what he can expect from a powder. The best powder is the one that most quickly and unfailingly "responds," exploding with clean, quick energy, with maximum speed and an even pattern and with low recoil.

These qualities have made DuPont Powders universally accepted as the standard for field, forest and trap. For over one hundred years we have been making Powders for sporting and military purposes. DuPont Powder is used by all ammunition loaders for shells and cartridges of all gauges and loads. You can be sure of the reliability, penetration and speed of shells and cartridges loaded with DuPont Powders, and of their high and uniform quality.

DuPont loaded shells are sold by hardware dealers, sporting goods stores and most departmental stores throughout Canada.

Wilmington, Del., U.S.A.

DU PONT

coveted rifle grow less and less. At last but five days remained. Something must be done at once.

It was then Murray resolved to put into effect the very next night, a set he had had in mind for some time. This he made preparations to do by hunting a spade and fitting his old fishing pole with a snare.

He was home the next night in double-quick time and off with the spade and pole. First, he went to the old sucker hole, where after considerable hard work, he landed a good-sized fish. Taking the fish and the spade he hurried on to the stump, the home of the crafty old mink.

Some little distance up from the stump, the banks of the stream rose twelve inches or more from the surface of the water. Here Murray decided to make his set.

Taking the spade he dug a pocket from the edge of the stream back some eighteen inches. This he made about five inches wide, and just deep enough that the water would cover the bottom to the depth of an inch or so. Next, he took the fish, washed it thoroughly, and fastened it to a small stake. The stake and fish he placed at the very back of the pocket. Taking the trap, he set it at the mouth of the pocket, and staked it as far out in the stream as the chain would permit, making sure that the trap and chain were covered well with water. Next, he dug up a sod with which he roofed the pocket. The set was finished, yet just by way of precaution against any odors sticking about, that might put the cunning old rascal on his guard, the lad splashed water all about where he had been working.

Murray visited his new set each of the three following nights, and at each visit found it just as he had left it the time before.

Nor did he see any signs of the mink. It seemed to have left the stump altogether.

December the twenty-fourth was a holiday. Murray was up and had his chores done early, intending to make a hurried visit to the traps and then go to town. This was the day the contest closed and he wanted to be on hand to see who won.

The rat traps were nearest, so he went to them first, and then hustled on to the mink trap, with the sole intention of taking it home, seeing the contest closed that day. Nothing seemed disturbed around the set and Murray was just about to pull the stake, when something caught his eye that made him shout for joy. There, on a knoll about a yard from where the trap had been set, lay the mink, caught well up on the front leg and dead as a "nailer."

Realizing that there was still a chance to win the prize, he grasped mink, trap, stake and all, and rushed off as fast as his legs could carry him to Mr. Crone's.

The farmer was hitching up to go to town when Murray arrived; sweat streaming down his face and all excitement.

"Why what's the matter and where did you get that dandy mink?" asked the farmer, before the lad could get breath to explain.

Then Murray related the story of the contest, and of his dream, and how after many days of vain attempts he had at last beguiled the sly old mink into a trap.

There was much satisfaction in Murray's smile that afternoon as he and the farmer emerged from the Jones' Hardware Store with the greatly coveted prize, which the "Dream Mink," as Murray fondly called the beautiful pelt had won for him, over the finest bunch of skins the farmer had ever seen.

Fatty's Luck

JIM BLEA

SUNDAY, 9 a.m., Oct. 27th, 1918, when the Spanish "flu" was creating havoc in Toronto, Charles D., James G., the writer and his hound, "Dan," left the above mentioned metropolis in a flivver for Petit's Point, Lake Seugog, with the sole intention of murdering a few wild ducks. The dog was only taken as mascot, also to make it inconvenient for Charles D. in the back seat, who placed one arm around him, the other restraining

five guns, four valises, and three dunnage bags in their respective places. However, Charles D. manipulated this clever acrobatic stunt with only one exception, and that was when I turned the car on a sharp turn and sunk on a three foot hole going at twenty miles an hour without giving warning, result: Dan was gracefully discharged from our midst and stood on the road giving an illustration of a camel, howling "The last rose of

summer." I was more than thankful he was not hurt after all, not only is he a good hunter but speaks two languages (his and mine).

We arrived at James G.'s chateau in less than three hours, and I must say here that James G.'s chateau has everything from a cake of ice to a real bed. After dinner prepared by James G., which was fit for the gods,—imagine, porterhouse steak, boiled potatoes, carrots and several of Heintz's 57, on a shooting expedition,—we then dressed up as "bums,"—old hats, boots large enough to accommodate five pairs of socks, and pants discarded several years before. After carrying three boots, two skiffs and one canoe down a steep hill we proceeded to sort out thirty decoys apiece, of course we knew what kind of ducks were going to fly so naturally we picked the wrong decoys as is often the case with the wise ones. This done, we sat on the shore and watched three lone divers a mile out from shore drifting in the calm lake all afternoon, which was not a very promising outlook for the next morning, but we coaxed ourselves into thinking that the wind might blow hard, and the North Pole freeze harder and drive the ducks south.

Monday a.m., one hour before daylight, James G. had us up. Breakfast over and the dog locked up, we made for the boats. As the wind was coming across the lake we chose the far shore for shooting. Just after I got my thirty decoys nicely spread out the rain started. They say the rougher the weather the better the luck, so I stuck to my guns. Now when I left camp I had no thoughts of rain (only ducks) and as it was cold when I got up I put on woollen socks, two woollen sweaters, woollen mitts, and tweed pants. Being a large man, 256 lbs. stripped, and 59 inches around the dining room I considered I absorbed enough rain in four hours to make Lake Skugog jealous. Three lone wild geese were the only feathered passengers that morning, and all we got from them was an imitation of an auto (honk! honk!) four hundred yards away. After drying my clothes we resolved to take Dan, the dog, to the swamps and see if rabbit shooting was any better. However, not a bunny was given a run, but Dan gave tongue in a language I did not understand, and as he did not get anything going, we went back to camp and prepared for the next morning.

Tuesday a.m. we were away to new points on the lake, the wind coming from a different direction, Charlie D. and James G. shot about a dozen ducks while all I got was the

flu (flew—English not Spanish), and judging by their straight course, they were making for General Villa's water resorts. After three hours trying to keep still, and warm at the same time, three ducks were actually making for my decoys. When about to pitch in they changed their minds, and on looking around I saw Dan tearing down the hill towards my decoys, he having deserted the camp to locate us. No duck shooting, and Dan on the job. I decided to take him alone to the swamps and see if he would give tongue as he did the day before. Sure enough he did and away he went at the rate of a mile a minute. To follow him up with my 256 pounds and excess baggage, I went first into low gear then on high. Pretty soon my cut-out started to puff. Ordinarily fifty yards run puts me to the mat, but there was blood in my eye and murder in my soul and was going to shoot that weasel or elephant or whatever it was. I cleared the first swamp like a rabbit. Midway through the next swamp I came to a stream. Stepping on a log to cross the miserable thing it took exception to my weight and refused to carry me only half way over. Dan, by this time had gained a long lead, his voice sounding many miles away. Picking myself out of the stream, I just strolled or wobbled until I came to the end of the swamp and in climbing over a snake-fence I discovered a nice seat right on top. There and then, I and myself agreed that the dog should bring this terrible creature he was chasing back to me, if I was to be the executioner. I sat there half an hour congratulating myself for losing a few pounds in weight, when Dan's voice came nearer to me. Between his swamp and myself was a ten acre field. I kept my eyes glued across this when—"Jumping Gee Whitackers"—if a large red fox didn't come out a head of him, he stopped and peeked around some brush at the swamp where Dan was, then turned and made for a fence to my right, jumped up this and took a few steps, down again, then for some unknown reason came straight for me. My 16 gauge gun had only number 6 shot shells, and I dare not move a muscle to change them. In a few seconds "bang" my gun went off, but it was in the proper place, I broke a hind leg first shot and the second shot finished him. Dan by this time was in the ten acre field going the same direction the fox had gone. I hollered to him that I had shot him but he didn't believe me, for he took no short cuts and followed the course right to me, where

Make Every Shot a SURE Shot by Using MARBLE'S Sights

Marble's Flexible Rear Sight

A universal favorite with both professional and amateur sportsmen. Stem is not rigid, but is held by a strong spring in base. Does not break when struck. Spring permits sight to give and instantly brings it back to correct shooting position. Price, including two discs with different apertures. **\$3.30**

Sheard "Gold" Sights

Widely known and deservedly popular because they are sights of the first quality—in principle and construction.

The sight blade is concave and oblique shaped, so as to reflect the rays forward and to the point and center of the long egg-shaped gold bead, so that it will not blur in the bright sunlight; will show up clear and distinct in dark timber. Made for practically all rifles, revolvers and pistols. Price, **\$1.65**

MARBLE'S REVERSIBLE FRONT SIGHT.

Has two beads—one ivory, one gold. Sight can be instantly reversed, so that shooter can have the ivory or gold as light requires. Choice of 1-16, 3-32 or 1-8 inch bead. Price **\$1.65**.

MARBLE'S IMPROVED FRONT SIGHT.

Gives the shooter a long look ahead. Makes accurate shots possible at any range without stopping to adjust rear sight. Object aimed at can be seen over or under bead. Ideal sight for snap shooting. Choice of ivory or gold bead, 1-16, 3-32 or 1-8 inch. Price **\$1.10**.

MARBLE'S V-M FRONT SIGHT.

Gold face and gold lined aperture. Used with a peep rear sight it gives a telescopic effect making quick sighting and extremely accurate shooting a matter of habit. Many experts prefer it to a bead sight. Price **\$1.65**.

MARBLE'S SIMPLEX REAR SIGHT.

A splendid sight for target and small game shooting. Stem can be quickly set in any position by raising the lock to a horizontal position and moving stem up or down as desired. Lock holds stem rigid at any elevation. Stem can be folded and locked down. Price, including two discs with different apertures **\$1.65**.

MARBLE'S STANDARD FRONT SIGHT.

A high grade, dependable sight for all sporting rifles. The ivory or gold bead instantly reflects the faintest ray of light and makes early dawn or twilight shots more certain. Choice of ivory or gold bead, 1-16, 3-32 or 1-8 in. Price **\$1.10**.

Can be used alone or in conjunction with peep rear sight, folding down leaf of adjustable when peep is being used. Marble's Adjustable has two different size notches as shown above. The notch piece is held at desired elevation by a screw and is reversible. Price **\$1.10....**

MARBLE'S ADJUSTABLE LEAF SIGHT.

GLADSTONE, MICH.

after a good rub with his nose he allowed me to start for camp. Next day the same time Charlie D., James G., Dan and I tried to locate another fox. Sure enough the hound was off again on another run but did not get this one so turned back to us. While going home through the swamp we noticed in a small pool, two green winged teal. One of

these we shot; the other soon got lost in the trees. Ducks are not found very often in these places. We broke camp that night. I had the fox done up into a neck-piece for my little girl as a Christmas present. Now I have an order from her for the muff that goes with it.

Pacific Coast Hunters Secure Albino Bear

THE following descriptive account of a unique bear hunt resulting in the capture of an albino bear was kindly forwarded to *Rod and Gun in Canada* by Mrs. Manley Hedden of Seattle, who with her husband Mr. Manley Hedden, is spending a few months at Ocean Falls, British Columbia. Mr. Hedden is connected with the Pacific Paper Mills Limited which has a large mill at Ocean Falls.

June the twenty-fourth was a red letter day for three hunters from the Ocean Falls Paper Mill of Ocean Falls, British Columbia. The party consisting of Fred Seivers, one of the most successful amateur hunters of the Ocean Falls district, accompanied by two men Messrs Spear and Spurb, crossed Link Lake, which is approximately half way between

Vancouver and Prince Rupert, and after a short walk came to a large muskeg. Making a detour of a few hundred feet they were delighted to notice a splendid albino bear and two cubs in a tree. The albino was dispatched with a few well directed shots but not before she charged for a distance of fifty feet from the base of the tree. She died game like all members of the bear family.

Mr. Seivers made a lasso of a rope and a sapling and climbing a tree close by he succeeded in lassoing both of the cubs and lowered them unharmed to the ground. The mother was a beautiful golden color weighing in the neighborhood of two hundred and fifty pounds. Her cubs, one of which has an almost human look as can be seen by the photo, were ordinary black bear cubs except for tufts of golden hair in their ears.

It is not hard to imagine the females of the wild life of the Pacific coast muttering, "Drug store blonde" when her ladyship passed their way and now that she has been gathered into the great Forest we can imagine the relief of the jealous housewives in the dens of *Ursus americanus*.

From Darwin's time and even before that, breeders of animals both wild and tame have endeavored to breed true to type. They have met with a wonderful degree of success but just when they thought that it was possible to breed an animal true to color for time eternal, Nature stepped in and with a playful thrust, set at naught the work of years. It is not the albino itself that causes the damage to the color line breeding, as it is invariably a freak white or golden color that could easily be disposed of, but the trouble arises through the mongrel color of the albino's progeny.

Bird Dogs I Have Met

THOMAS HUBERT HUTTON

NO doubt you will be surprised to learn that one of the very best bud-dogs I ever met was nothing more nor less than an Airedale terrier. His name was "Blake's Laddie" and beyond the peradventure of a doubt he was the equal of any pointer or setter I ever hunted with.

Possibly right here it would not be amiss to describe the Airedale in brief. The Airedale is the largest and hardest terrier yet produced owing his great and growing popularity to his adaptability to every kind of sport. Singular as it may seem, he is the product of mere chance, having been evolved some sixty years ago, in the valley of the Aire river, between England and Scotland. In the region where he first appeared were sturdy out-of-doors Yorkshiremen, keen huntsmen by land and water, whom the local game wardens in all probability branded as poachers. These men owned all kinds of dogs including the big and aquatic otterhound, several species of the intelligent and aggressive terrier, the old reliable English sheep dog, and the indomitable bull dog. Out of this potpourri of dogs evolved the new type which combined the best qualities of all his motley forbears. He got his size and strength, trailing ability and love for water from the otterhound. He got from the terrier quick, keen wits, a bright alert eye and a swiftness of movement apparently incompatible with his weight. His adaptability for driving and guarding stock was his inheritance from the old English sheep dog. The bull dog gave him tenacity and courage to the death.

Naturally the Airedale terrier as we find him to-day is the most versatile, the most accomplished, and the most daring of dogs. He is a natural hunter, has a keen nose, and is easily broken to gun. He will do all the work of a spaniel. A capital water dog and retriever, he is a first rate workman on shore, and when hunting along the banks of a river there are few dogs that can equal him, for his close, wiry jacket enables him to withstand the effects of the wet, whilst being such a big dog he is more than a match for any sort of vermin he may fall across. Rats he will destroy as quickly as one can wink an eye, being almost as quick in his movements as a mongoose.

The Airedale will hunt rabbits with the zeal of a beagle or foxhound, tree a coon, and

kill him when he drops; as for muskrats, otter and mink, he is swift and certain death. No hole is too deep in the water for him to follow his quarry; for hours he will work indefatigably, and woe betide the object of his search when found. In addition to this, he is easily taught to retrieve ducks and geese, and on account of his size and strength no sea is too rough for him when in pursuit of wounded wild fowl.

The city fancier enjoys his companionship at home or in cross country tramps, at which times the Airedale is always busy and ready to find something of interest, whether chasing rabbits, yarmints, or shaking a mountain beaver, or treeing some noisy squirrel or grouse, or pointing a bevy of quail, all for the fun of it. If a swim is on hand, he is first to enjoy it and stands ready to retrieve anything or if at the shore handles himself dexterously in the surf, and in shoal waters an Airedale will fish for hours at a time, running up and down the flats, following the little darting fin bearers with head under water seemingly as often as out.

The farmer and rancher have found in the Airedale a dog that combines more than any other breed everything that is useful in a dog. He will drive cattle and sheep like a collie. He loves to continually hunt for and exterminate all vermin and pests to poultry. He is the one dog that can be depended upon at all times to quickly sound the alarm of molesting marauders being about, and he is a willing assistant in driving away the howling and mischievous coyotes and when it is possible to corner one, will single-handed kill it with neatness and dispatch. When the farmer finds his place visited only too early for his slumber by 'coons in the chicken coop or a visit from the destructive skunk, if he is without an Airedale on his place, he begins to think it's about time he had one; for nothing ever destroys bird or animal life on farm or ranch without an Airedale knowing it and he loses no time in dispensing the enemy instantly, and all so naturally and willingly, without guidance or suggestion.

Hunters and trappers have come to find in the Airedale a dog par excellence for their life. The slightest movement in an adjoining thicket, he hears and detects instantly, or he scents distant game long before one has any

Wm. F. Nye, New Bedford, Mass.

1. Mrs. Stanley Blake's favorite dogs are Airedale terriers.

2. None are cuter than Airedale puppies.

3. Mr. Stanley Blake is also very fond of Airedales.

idea of its presence, leading his master still-hunting to it, or if allowed his freedom, going off with a bound and at a pace that no other dog can surpass, out of sight and hearing until he has rounded up his quarry and has a bear at bay in some recess, or cougar treed, or bobcat cornered, when, with unceasing and noisy tongue, he tells the tale to the otherwise peaceful hills and dales, that he is there to stay hours if needed, until his hunter-master comes to put an end to the wild prey of his finding. Instances are reported of Airedales staying with big game treed for two days' time and more before being found.

In point of disposition, no dog could be possessed of more qualities that would endear

him to his owner. He is far from quarrelsome with other dogs, is inclined to shun them at walk; but let another dog dispute his right to advance, he is up and at it in a moment. Then his opponent must look to himself, however, big and strong he may be. The Airedale's jaw, of wonderful length and punishing power, soon does its work, and he would sooner die than turn tail. At home he is docile in the extreme, fond of children, and a good guardian, also obedient to a wonderful degree, which coupled with an intelligence almost human makes him a most enjoyable and trustworthy companion. The Airedale, moreover, possesses another great recommendation in the eyes of many dog lovers, this being the possession of a very hardy constitution, which causes little trouble to his owners during the early stages of his career, and when grown he can stand an unlimited amount of rough and tear work. Altogether, he is one of the most useful dog's living, and has a personality all his own.

“Blake's Laddie,” combined all the qualities of the Airedale and possessed in addition all that goes to make up a perfect bird dog, being absolutely staunch on point, steady to wing and shot, and a careful, slow worker. I found this out one day last fall. Here is the way it came about:

Stanley Blake, the owner of “Laddie,” invited me to accompany him on one of his numerous hunting excursions. Of course, I gladly accepted the invitation, as he is a jolly fellow to be out with and a sportsman of the first water. Mr. Blake had frequently told me about his bird dog “Laddie,” but my big surprise came when I asked him whether “Laddie” was a pointer or setter and he startled me with the declaration that he was nothing more nor less than an Airedale terrier.

To me, it sounded most too incredible to believe and when I voiced my skepticism jokingly, friend Blake immediately threw down the gauntlet and accepted the challenge to prove his statement, to wit: That “Laddie,” the Airedale, was a sure enough thoroughly trained bird dog.

That was his impelling reason for extending the invitation to me to accompany him on the hunting trip, so on the morning of one delightful autumnal day we started out, “Laddie” and “Jingo” (one of Blake's fine string of Pointers) held firmly in leash, but not without difficulty, as “Laddie” especially appeared very ambitious to get loose. At the moment I did not attribute this quality to any desire on his part to get to work on quail,

THE GREAT ENGLISH FIELD says, "We must never forget that it is to HARDY Bros. of Alnwick we owe the supremacy we have achieved as Rod makers."

merely thinking his evident anxiety to be freed was nothing but pure wildness, and I remarked to Mr. Blake that when "Laddie" did get loose that would be the last we would see of him. I never saw a dog carry on so frantically in my life. He looked as though he'd die if he wasn't liberated right then and there. "Jingo," aside from wagging his tail and giving his master wistful and anxious glances every now and then, showed no inclination to be freed from the chain.

We were steadily tramping 'cross country and by this time had gotten well out of sight of the little town from which we had started and soon we would come to good bird country.

It wasn't long, therefore until the eager "Laddie" and "Jingo" were set at liberty, and as I had predicted "Laddie" made a wild rush and was soon clear out of sight while "Jingo" was more careful, hunting every bit of the ground thoroughly that he went over.

"Now," said I, to friend Blake, "Laddie's actions right from the start show he's no part of a bird dog and explode your claims completely."

"You just be a little bit patient," Blake retorted "and give the Airedale a chance. That first little initial dash of his is just to get his blood circulating right. He'll simmer down in a minute and then he'll work even slower and carefuller, than "Jingo" is workin' now."

"Maybe you're right," said I, "but you know I've adopted the "show-me" attitude. It's up to "Laddie" to redeem himself if he's got sense enough, which I begin to seriously doubt."

Considering this a pretty hot shot, I closed my chops and remained silent a spell, giving it plenty time to soak in.

But a moment of time proved that Blake was right and I was wrong, for "Laddie" did simmer down and got busy in a manner that immediately stamped him as a first-class bird dog. He out-hunted the pointer forty ways, and in no time at all, it seemed, was pointing a bevy of quail, one forefoot uplifted and his whole body held as rigid as a statue of stone.

The best "Jingo" could do was to back him, and a pretty picture it would have made, had a camera been handy, but that's nearly always the way of it, one never has his kodak ready at the right time.

When the smoke cleared away "Laddie" and "Jingo" retrieved the two birds Blake shot and I saw that "Laddie" was just as tender a retriever as any pointer or setter

dared be. My surprise melted into admiration and I forthwith congratulated my friend and assured him the smokes were on me the moment we got back to town.

The Airedale terrier as a breed has not only shown his sterling qualities as a sportsman's asset, but he has also proven his worth in the recent great European War.

Originally bred in England, in the Valley of the Aire river, developed with no end in view greater than utility, he is the ideal dog today for war duties. He has well been called "the most self-contained dog"—one of his most valuable traits when he is considered for purposes of war. He is never unduly excited or disturbed even under the greatest strains of terror. His sagacity, fidelity, nose and hardiness stand him in great stead. I was a long time realizing that the Airedale was something more than a "passing fad," and I was only convinced when I saw "Laddie" worked alongside a thoroughly trained and pedigreed pointer and saw that he was even superior to the pointer in bird dog qualities. I was just a Doubting Thomas, as no doubt many of those who scan this page still are, and to these I would say all you have to do is try one out and see for yourself their value as an all around utility dog, no matter what you want to use them for.

The Airedale was bred originally for a real working terrier—and he is actually all that has ever been expected of him, and more. By instinct and training his senses have been developed towards the end of value. He is without a peer in the world of dogdom for intelligence. No dog can boast greater gameness, none has a keener nose, he is supreme in the water, and his size, being the largest of all the terriers, stands him in good stead. He never seeks trouble—but is always ready for it when it comes.

The Airedale is almost universally healthy, and his heavy double coat enables him to stand even the most severe climate. He adapts himself anywhere, from the equator to the North-Pole, and from the home to the battle field.

From the Otter Hound the Airedale inherits a nose as keen as any of the hound family. This valuable nose is backed up by a sense of hearing that has no superior. In their native land experiments have been made at Scotland Yard which prove that the Airedale can detect sounds far away by hundreds of yards for the most acute ear. In the English army they put this faculty into practical use: The Airedales are trained not to bark at

The three words that tell the whole story of a perfect cup of coffee, from plantation to breakfast table—— "SEAL BRAND" COFFEE.

TELLS HOW FAR YOU WALK

THE AMERICAN PEDOMETER

Regulates to Step and Registers Exact Distances; Simple, Accurate, Durable.

Indispensable to every lover of outdoor sport and especially to those who love WALKING. Instructive because of value in determining distances; a necessary adjunct to compass and as useful to SPORTSMEN. It furnishes the true solution of many a disputed question of how far it is to or from various points. Best of all it is a wonderful health promoter because its interesting notations afford real incentive for WALKING. Whether you walk for health, business or pleasure—anywhere, everywhere, the AMERICAN Pedometer tells the whole story of just how far you have travelled.

strange sounds in trench warfare, especially at night, but to give low growls—and in this manner warning of the stealthy approach of the enemy. By both scent and hearing the Airedales can do this when the human ear would not enable the soldiers to detect the presence of danger. The degrees of the dog's growl indicate the nearness of the danger in these cases. They are trained to express themselves just a little more positively as the danger is greater, or otherwise. No other breed would lend itself to such subtle training.

In the ambulance service the Airedale is also most valuable; he can tell, better than can any human, whether or not life is extinct. The dogs are taught to go about the fields of slaughter and single out those of the wounded in whom there are yet signs of life—and many of these are thus saved who would otherwise perish. A noble work for a dog, as you will agree! But what animal has ever done nobler work than man's greatest friend—the dog?

The highest praise for the Airedale is given by those who have seen his work on the bloody fields of battle in Europe. He even thrives on the battlefield by reason of his gameness, quickness, and hardy constitution. He learns to actually love the sound of heavy gun firing. He can tell the English Tommy from the German Hun, and in many hand to hand trench conflicts he has lent his aid and proved himself a fearful assailant. No doubt now the great war is over many a soldier owes his life to the timely assistance of an Airedale, and I venture the prediction that there will be very few returning soldiers who will not be dog enthusiasts for the remainder of their lives. This will necessarily create renewed interest in man's greatest friend and assure the dog human sympathy for many

years to come. Here's hoping that one of the fruits of the war will be to evolve a better understanding on the part of the great mass of the people as to the value of the outdoor world in general, and the dog in particular.

"Laddie" was not only a well-trained bird dog, but he had the breeding to back him up and it would not surprise me one whit if some day he should slip up on the "dog world" and capture first-prize as the greatest BIRD DOG in America. In all probability, however, he will not do that, as the general run of bird dog judges would likely be somewhat prejudiced in favour of the setter and the pointer, even though the Airedale's work as a bird dog was superior—a decision in favour of the latter might be called "a comic mistake," or something like that, and work detriment to the offending judge. The successful judge knows that he must strive to please the majority and the setter and pointer men would assuredly resent having their dog bested by an Airedale terrier. It would submerge their pride to such a depth that it is doubtless if they'd ever be able to get their "periscopes" above the surface again. Any judge would know that. So I guess "Laddie" has a slim chance.

But that doesn't keep him from deserving the honors anyway and I'd sure love to gamble on him before an unbiased judge. "Laddie's" real name is "Haughty Lad of Ashborne," 167025 A.K.C., by Ch. Soudan Swiveller, ex Red Riot of Ashborne, so you see he is well fortified in the best Airedale bloodlines. I only wish he could get a chance to show his equality as a bird dog at some Field Trial event where the best setters and pointers in the country were participating. He'd sure make the wise ones sit up and take notice.

A Vision Realized

AN AMATEUR

*"Yarrow's stream unseen, unknown,
It must, or we shall rue it,
We have a vision of our own,
Ah! why should we undo it."*

Not being a poet, and when one's larder provider's theme is ducks, first, last, and all the time, one must inevitably yearn to see the vision realized, a vision which you will

perceive finally culminated, not like the vision of Yarrow, which failed miserably to measure up to the reality, but rather the reverse.

The afternoon we had planned for our journey proved ideal. The air was clear and just crisp enough to be exhilarating as we tramped along on slaughter bent.

Having soon left the town far behind, we

Vacation Days

Take Along a Gillette

For the Gillette owner, life is one long holiday from stropping and honing. It is a round of daily luxurious shaves. The shaving quality of the hard-tempered, keen and lasting Gillette Blade is a never failing source of satisfaction.

You, who are planning a vacation, should include one pleasure you can enjoy twelve months each year—buy a Gillette Safety Razor. Free your holiday from strops and hones.

The new Kit Set—the Pocket Edition Gillette Safety Razor—in a limp leather roll case, complete with twelve double-edged blades and a mirror, takes only a few inches of space in your kit.

Remember how the Gillette was the choice of the soldiers of all the Allied armies. You will need a Gillette to remove your open-air growth of beard.

The price is \$5.00

took to the fields to shorten the distance. I don't know how many we crossed, but they included pasture, stubble and ploughed ground, and in spite of minutes lost in seeking means to avoid climbing the fences, we made quick work of them, arriving at our destination in less than an hour.

Running along the west side of the northern end of the marsh was a snake rail fence, and parallel with that and quite close, was a path, evidently worn by cattle. From this eastward, the ground overgrown with willows gradually sloped to a pond, at the edge of which earlier in the season a hide had been built.

My larder provider had been offered the loan of a punt, with which to retrieve the ducks. This, he had been informed, was hidden in the willows near the fence. Long afterwards he discovered that the reference had been to another fence stretching diagonally across. However, after he had spent about ten minutes in a vain endeavor to locate it, I thought I would have a try. The ground looked solid enough and I was anxious to get a glimpse of a muskrat house, but before I had proceeded far, I felt the water oozing through my boots. Needless to say, I lost no time in retreating and establishing a firmer position on the fence, leaving the boots unoccupied on the end of the top rail, as a target for the sun.

Ultimately abandoning all hope of finding the punt, he next decided to attempt wing-shooting at another smaller pond farther south where the water was shallow.

I watched him as he followed along the path until he came to where the fence turned directly westward. Southeast of this corner, a distance of perhaps forty yards, were several uprooted pine stumps standing in a row. This was his objective, as it was the only cover the place afforded and the pond lay just east of them.

He had not been there long before three came sailing over. I saw the gun spit fire and one drop. Then I saw him as he waded through the long grass after it, but just at that time my attention was directed to the willows, where I was sure I heard something moving. I climbed down from the fence and in doing so, jarred the boots off on the opposite side. Having managed to reach one through the rails, I tried to pull the other nearer with a stick but it refused to come. Meanwhile, the sound became more and more distinct until I could hear every step. Terrorized, I grabbed the one boot but in turn-

ing to flee, I beheld just emerging from the bushes, the head and shoulders of a big steer. My fears allayed, I resumed my vigil on the fence just in time to see the hunter, minus the hunted, disappear behind the stumps again.

By this time the sun was on the horizon and the tall trees scattered along the fence, cast long, dark shadows across the marsh. I didn't relish the idea of moving any farther south, as the walk home would be long enough but I eventually concluded I should, at least, feel more secure nearer the ammunition depot, so having slipped the fence and crawling under berry bushes, then climbing back, I trudged along the path.

On coming to the turn I sat down and made an effort with the inadequate aid of a hair-pin to button them, but after repeated exertions the buttons on the proper side resembled hen's teeth, which they say are few and far between.

Meanwhile away to the south I heard an occasional shot fired and after each one I looked up expecting to see some ducks but none came.

As I sat there musing, I recalled the words of the great poet who gave as a reason why men went hunting, "It's the lure of little voices; It's the mandate of the wild." Surely he didn't mean the mosquitoes, they were the only little voices I heard and to me they were rather more repelling than alluring.

My reverie was interrupted with "Bang! Bang!" followed by indistinct words. I was not sure whether he was trying to assure those two still unscathed but frightened ducks that all was well or whether it was a call for more to come, but I had grave suspicions that it was neither, and I resolved then and there to listen better to the next item.

As I gazed about to see if more were coming away to the south-west, I observed a black line looming up which proved to be ten ducks but just as they came within sight of the pond, they veered to the north as though disappointed in not seeing others of their kind feeding there.

Nothing followed, not even the report of the shot-gun, and my curiosity was aroused beyond restraint, so that after the ducks were out of sight, I called to him to know why he didn't shoot and after expressions of surprise he said that they were out of range.

I called myself stupid for spoiling my opportunity but it made no difference, for although we lingered some time longer no more came and when I ventured, as we

Double Service From Your Canvas

Tents, ground covers, bed-rolls, pack-saddles, canvas wearing apparel, duffle bags, and supply covers are just a few of the many things that go to make up the complete camping equipment. And for these needs there is no material that gives the same service and economy as canvas properly treated with a preservative waterproofing.

PRESERVO through the universal satisfaction it has given is recognized as the standard soft finish waterproofing and mildew-proofing for canvas. For many years the canvas users of America have used PRESERVO to waterproof and preserve canvas. For experience has shown that plain canvas does not provide economical protection.

Untreated canvas is not waterproof against any but the light rains. PRESERVO treated canvas is waterproof against the hardest storms.

Untreated canvas is short-lived—mildew causes rapid decay, and exposure causes it to become stiff and hard to handle. PRESERVO

treated canvas is absolute proof against mildew and decay, it remains soft and pliable and wears at least twice as long as plain canvas.

PRESERVO is inexpensive and easily applied to new canvas or to old canvas. Almost any canvas goods dealer can supply you with PRESERVO-treated canvas or with the liquid PRESERVO. You can add new life to your old canvas by treating it with PRESERVO.

Insist on the Genuine PRESERVO.

While there are other methods of waterproofing canvas, there is only one genuine PRESERVO. You can insure maximum service and economy by insisting on the genuine.

Write us about your canvas needs and let us tell you about the saving you can make by using PRESERVO-treated canvas. Ask for our special book for campers and sportsmen.

wended our way homeward, to ask him why he didn't try a duck call again he said: "That is a secret and women can't keep a secret". Well if I was ruffled, there were no visible signs for it was then dark and I instinctively knew we were approaching a barbed wire entanglement in the shape of a fence and without assistance I might possibly be an unwilling picket there through the long night watches. Within an incredibly short period heavy black clouds had obscured

even the faint light of the stars, making the intervening fields, before we landed on the King's highway, seem so rough that they suggested the thought of No Man's Land and all that it implied and we invariably uttered something particularly impressive about Prussianism, whenever we unexpectedly fell over a stump or bumped into a fence. Weary and worn and sad, we reached home at last and our one regret was "We had a vision of our own, Ah! why did we undo it?"

A Camp Fire Reverie

W. MCCARDELL

THERE'S a valley over the White-Man's pass that's never been explored. I've heard strange tales from the Indians of things that have happened there and I'm going to make it a point to visit that valley. You can make it a safe bet that there's something mighty curious in a valley that an Indian won't explore; when he stands longingly at the entrance to a promising hunting ground and refuses to enter. Nothing less than something approaching the flaming sword at the entrance to the Garden of Eden can prevent him from entering. It has to be something very mysterious."

The speaker was a bronzed bearded giant in the centre of a party of men gathered about a camp fire in the hinterland of the world. They were part of the vanguard who are gradually extending the limit of their exploration until it encompasses the loneliest valleys and they are gradually pushing the world's frontiers out to the farthest out-posts of the unknown.

They were discussing what might be in this valley. The bright circle of flame lit up the quiet faces of the other men; around them was the darkness and eerie silence of the night. By the time each had speculated as to what might be in the lonely and undiscovered valley, one would have thought that it was the place where the God of Adventure sat on his twilight throne, under the canopied palace of sunset. Then I realized that the Camp-fire is a witch's cauldron in which is conjured up the strange tales of the woods.

I knew they were just romancing and were wishing for the perfect valley that only the explorer dreams of. I knew what sort of

scenery they required in this valley to which one could not get until they had crossed a rugged barrier of mountains where the lean blizzards swept the peaks and the mist constantly trailed across the scarred cliffs. Over the other side of this rugged barrier to which one was conducted by some Indian, who was loyal enough not to show any one else, one descended into a valley where summer lay eternally and the creeks ran with gold. There would be a long blue lake stretching through a deep forest and one day the quiet dip of the paddles would be heard over its surface and then a lovely dream girl would quietly run her light canoe ashore, step out and immediately fall in love with the daring explorer who had conquered the barrier.

If only one could gather all the strange tales that are whispered in low-voiced murmurs over the flickering campfire

The brotherhood of the camp-fire is the oldest institution in the world. It had its dim beginning in those days when the cave-men roamed the earth. The camp-fire was the first mother of literature. The cave-man gazing into its profound depths was stirred with visions that could not be expressed in words and his bosom throbbed with dim, eerie feelings. This was the dawn of thought for thought was born in the crucible of a camp-fire.

These men talking out in the depths of night are the glorified inheritors of the cave-man's first vision. They too, are just as profoundly stirred and as they look into the flames they are seeing visions that are carrying the cave-man's dream farther out into the timeless sea.

The camp-fire is the emblem of discovery

PHONE MAIN 4630

SIGNAL SYSTEMS, LIMITED

CROWN OFFICE BUILDING

TORONTO, August 15, 1919.

ATTENTION:

Executives and
Business Managers.

Gentlemen:

What is going to be the outcome of this Labor and Industrial Unrest, Strikes, etc.? Does it predict shorter hours at a higher rate of pay, or to cut it short, increase the cost of production. This is what it very much looks like. That will mean that you will further have to investigate your production costs and your general plant efficiency and strive to get 100% efficiency in order to get scientific production. It is here, that we can be of great service to you.

A Loud Speaking Telephone System that will multiply your executive efficiency.

Electrically controlled "IN" and "OUT" Time and Cost Recording System.

Electro-Call System that will locate a man around your plant in 30 seconds.

Inter-Communicating or Departmental Telephone System that will save you steps and get things done, and many other Automatic Systems that will help to get you the 100% efficiency in your Organization.

We have complete illustrative Bulletins on these Systems and will be very pleased to hear from you as to when it will be convenient to call upon you and go into the matter very fully. Will you drop us a line?

Always at your service, we remain,

Yours very truly,
Signal Systems, Limited,

and when through the myriad valleys of the world, the camp-fires flare up out of the darkness it seems like the hoisting of a signal, spelling out the day's march into the realm of distance.

I wonder when the day will come when the earth will have no more undiscovered hinterlands, when all the Eden-valleys that lie in the mysterious realm of the unknown shall be discovered. I wonder when all the brooding silences of lonely continents will at last echo to the sound of human voice.

I know that when that day comes the camp-fire brood will not rest and be sluggish.

From this they will turn to the master exploration; and the lonely planets gleaming out in space will be their goal. The 'Columbus' of the world's far places will pass on their spirit and it will live in the 'Columbus' of space. They will fare down to the dim regions beyond the farthest ebb of the twilight sea; down through the moonlit glory of the plains where Jupiter wheels in

his stately orb with his attendant train of seven moons to accompany him into the stellar halls down into the far away depths of the blue-gulf.

These men of the out-door world are carrying the dream of exploration to that day when the sea will be marked and charted like the currents of the ocean and man will venture down to the murky halls where flaring comets die. These men are the forbears of the superman whose members will belong to the 'Earth and Martian Aero-Graphical society.' And the wheeling planets and the lords of the outer marches of space at the edge of night shall be their stamping grounds.

Yes these men gathered about the camp-fire all of them dreamers, are opening the door for a greater and wider exploration, where man, Mahomet like, rides to the palace of creation.

The dream of the cave man is still soaring its way into the silence and will never end so long as there is space to conquer.

A Perfect Day

M. I. TAYLOR

"Maggie—oh, Maggie!—Maggie; do wake up."

At that whispered injunction I opened my eyes lazily, just to show that I had been awake for as long as—ten seconds—and stared at the eye which peered through the knot that by some oversight on the builder's part, graced the partition between my room and the girls' at our summer cottage. The eye blinked back accusingly at me and the whispered conversation continued, although we might just as well have shouted aloud at one another, for the nature of summer homes is to magnify the slightest rustle into a whole advancing army and a gentle breath into a megaphonic blast.

"Well, what do you want now, Nora?" I asked.

"It's going to be a perfectly 'scrumptious' day and Vee and I think it would be just the time for our walk to the Point. We can leave at ten, have lunch at the hotel or picnic outside with what we can buy at the stores; catch the noon boat up the Lake again and have a perfect day. Won't you persuade mother to let us go?"

The Point, I may explain, is a thriving

little hamlet at the junction of the Lakes. It had been our ambition always to row to the mainland and follow the road down to it, the tramp being approximately seven miles. Somehow, lack of energy had prevented the consummation of our plans, but to-day the inclinations of all three coinciding, we prevailed upon our fond parents to give us their permission. Forgetful of the fact that the average temperature for the last week had been 100 degrees F., oblivious of the headshakings of our advisors, and undeterred by the fact that none of us had been really walking for two months, we started off—and thus began the realization of our dreams.

Of course, it was very hot on the water, but that was to be expected and the cool shady roads would soon refresh us; and, too, walking shoes did feel rather uncomfortable after the running shoes in vogue on our rocky island, but our feet would soon become accustomed to them; and as for the smiling looks of incredulity among our friends at the wharf where we landed,—why they were naturally lazy, that was all.

As we struck off along the road, father called us back and gave us a little makeshift

Pure coffee—not denaturized, not decaffeinated, not de-anythinged. It is the real thing ready for instant use. A little can makes many cups and saves coffee-pot and cooking. Easy to carry—easier to use.

Ready instantly—when you pour on the water—hot or cold.

lunch of cookies and apples which had been prepared for our use along the way, in case we should develop famishing appetites. In a rather superior fashion, we accepted the gift with thanks, but inwardly meditated dropping it at the first convenient place by the roadside. Having, however, a Scotch sense of economy, we deplored such waste, consumed what we could of it on the spot, and then resumed our way, leaving the remnant amongst the grass and thus automatically ruled out one chance for future happiness.

It was hot, and although there were "cool and shady" spots along the road, they were very few and far between. We could feel the mercury creeping up and up, and our own opinion was, that it had reached somewhere around 200 degrees before we had gone a mile. The meteorological report of the day belied our estimate and gave it conservatively at 98 degrees—but as I said before, it was hot.

For the first part of our pedestrian effort, we found the road running through the midst of a great raspberry patch, and inevitably we stopped to pick the fruit. Why, I wonder, does everyone feel it incumbent upon him to pick wild fruit when he sees it? We knew that the seeds of the raspberries are most unpleasant; that the sweet acidity of the berries would draw our mouths; and that the fruit still left on the bushes was of a most inferior quality as the season was late, but still we ate them, and regretted it immediately.

Finally we reached the spot where our crossroads joined the main thoroughfare and we felt sure that our objective lay just around the bend. Others were not so optimistic, as we found out, when we questioned a kindly old gentleman, who sat under the shade of the only tree in sight, consuming a supplementary breakfast or lunch of bread and cheese, with the all too apparent aid of his pen-knife.

"How far to the Point? Is the Falls near here?"

"Yes just three miles on."

"Um—well it must be six miles good to the Point. Warm to-day isn't it!"

With which bright and original remark the conversation closed but our informant looked as if he thought it was a distinct pity the Point did not boast a lunatic asylum.

The raspberries now gave way to chokecherries and every fence-corner had its great bush-like tree literally covered with the

rich luscious, deep red, almost black fruit. Again we illustrated the frailty of human kind by insisting upon sampling the product of every tree, until as a result of raspberries chokecherries, dust and heat, we felt that there might be something after all in the stories of the men who were willing to trade with Mephistopheles for a drink of cold water. The surrounding country was fertile farming land, but most uninteresting scenically. Thrashing operations at one establishment did something to enliven the landscape, but apart from that it was all equally monotonous. We tried to beguile the time by imagining that we were touring England, but that recalled poignant memories of cool green hedges and frequent villages, where one could procure an abundance of Devonshire cream, fresh fruit and muffins, and we knew, alas, from sad experience, that the gaunt, lonesome, farmhouses around us, would yield nothing more inviting than skimmed milk, unpalatable green tea, or water, the latter beverage being always chosen by the wily traveller in self-defence.

Miles further on, another bend in the road aroused our hopes anew. Alas! too sanguine were we, for they were dashed to the ground by the long, unblinking, dusty white ribbon that stretched ahead of us, when we reached it. Even water appealed to our no longer fastidious taste, and we decided to petition for some at the first farmhouse which we passed. Curiously enough not one building darkened the horizon, and it was not until a mile or more had been traversed, that we again saw the unlovely bulk of a Northern Ontario farm house ahead of us. A profusion of gaudy flowers cheered our drooping spirits as did the bright little bride who drew crystal clear and icy cold nectar for our delectation and of it you may be sure we partook liberally. At last the world looked rosy again and thinking of the lunch awaiting us at the hotel, we felt our pleasant anticipations re-asserting themselves, only to have our hostess, like a croaking raven, blight our hopes.

"Yes," she was saying, "I've had a rather busy day, for one of the boys from town has just left. He's on his way to see his brother who is dying, and, mind you, the doctor says it's from drinking very cold water when he was overheated."

She thereupon, proceeded to give us with commendable accuracy and realism, all the symptoms and lurid details of the illness, and as a result, queer uneasy sensations in the region of our digestive apparatus and a futile

HUNT—

effort to remember whether the hamlet ahead of us had a resident doctor, disturbed our equanimity considerably. Ah, well, to-morrow we may ourselves be "with yesterday's seven thousand years," as our friend Omar says, so we decided to make the most of what yet remained to us, again thinking of the philosophy of the Eastern poet. At this point in our meditations we turned another corner.

Then there faced us a high hill—at the foot of which, one member of the party went on strike and insisted upon resting, so we called a halt and discussed the mathematical probability of our surviving the day. With a confidence that I did not altogether feel, I insisted that I remembered (although I had never been along the road before) that we could see the settlement from the top of the hill and again we walked. This time it did happen as I had foretold and the consciousness of a successful conclusion to our trials filled us with gleeful anticipations. There were hotels, two of them; stores, two of them; a park, the Lake, and best of all there would soon be the steamer and HOME. What more could one want?

We decided to see what the chances for a picnic were, before we entrusted ourselves to the tender mercies of the hotel proprietor, and entered the general store, with the modest request for some fresh fruit of any kind. To our amazement, we were told by the store-keeper that he had none, but so patent was our disappointment that the gentleman took pity upon us, searched more diligently and ultimately recovered three skinny little oranges, which we took most thankfully. Neither biscuits nor candies were to be had, there, and we were told to try the other store, while "pop" and ice-cream were to be procured next door.

"Next door" proved to be a disreputable looking hotel having in its windows a sign on which had been scrawled the legend "Ice-cream parlour." We were served in a dismantled sitting-room, which contained one rusty stove, two relics of the family portrait gallery, one oil-clothed topped table and five chairs. A rustic Ganymede in the shape of an ancient sailor, took our order and reappeared, bearing three diminutive glasses of lemon sour and cones that were even more limp than we ourselves. As I was endeavoring to prevent mine collapsing, he inquired solicitously, "Is it leaking, lady? Here wipe it with this," at the same time handing me an indescribably dirty pocket handkerchief. Fortunately our sense of the ridiculous came to our rescue, and we retired hastily to indulge in unrestrained merriment.

One hotel and one store still remained. A glance into the abyss-like interior of the former, led to its elimination and dismissal as a possible candidate for patronage, and we were forced to content ourselves with some very soft milk chocolate (sanitarily wrapped, however) for our last hope. Oh how good those cookies and apples would have tasted just then. With our hunger only partly appeased, we betook ourselves to the lock, which was being opened for the steamer. On board our buoyancy of the early morning again appeared and we amused and mystified the crew and passengers by talking very volubly in French, a language in which we all had some little proficiency.

On looking back over our outing, we found that the bright spots soon flooded out those that were gloomy, and when we disembarked at our "ain hame," we called out vociferously and in single voice (and we meant every word of it.)

"We've come to the end of a perfect day."

A Day's Tragedies

IAGO

EARLY that morning the eagle left his mate, who flew over the ridge in search of prey to feed the hungry eaglet in the eyrie on the rocky promontory.

For a time the mate kept on a straight course but finally began to circle. Far below him he saw the roads, mere lines at that height, joining the ranches to the settlement.

One of the ranches (if you could call it a ranch) he passed over was a sandy field of about two acres cleared land and three more in timber and stump land. At one corner of the cleared piece was a small log cabin and in the centre a ruined and dried up well which was the haunt of gophers. The land was planted in fruit trees and a mixture of

EVINRUDE

Detachable Motor for Watercraft

With an Evinrude you can go quickly, without rowing, to the holes where big catches are almost sure. Distance makes no difference to an Evinrude owner.

Variable speed, suitable for trolling. Swift, smooth, flexible power for canoe, rowboat and other craft.

Built-in flywheel type magneto. Automatic reverse. Maxim silencer and tilt-up arrangement if desired. Our special method of balancing practically eliminates vibration.

Nearly 100,000 Evinrudes have already been sold.

The Evinrude is used by 25 governments.

CHESTNUT CANOE CO., Limited, Box 445, Fredericton, N. B.

thin timothy and clover was withering and turning yellow with the heat and drought all over the field.

Here and there was a mound of yellow sand made by the gophers that infested the place and sitting on one of these bolt upright was the maker of it scarcely discernible against the background. The eagle shut his wings and dropped perhaps a thousand feet. Still he was evidently unnoticed. He was about to swoop down upon the gopher when something in the brush caught his eye. It was merely a cock pheasant in a little patch of soapberry bushes. Instantly the eagle forgot the gopher and shut his wings. Down, down he swooped until almost on the bird.

The pheasant had been wandering round the bushes in search of food and at last had found a nest of black ants and was busily engaged gobbling them up when a sharp hissing sound overhead took its attention and it ran under the stump pile not two feet away, just as the eagle hit the ant nest. The eagle circled about two or three times and then flew toward the river. Far off down the river he saw a whitish streak plunge into the still water. It was a fish hawk diving after a large lake trout. Instantly the eagle flew towards it. Now the fish hawk was falling heavily with the trout clutched securely in its talons. The eagle took after it and soon caught up with it, whereupon the fish hawk dropped the trout and it went tumbling down, a gleaming shape, into the placid river. If the trout fell fast the eagle went faster and splashed into the water a couple of seconds after the fish, which was now heading towards the deep water.

Then the baffled bird flew inland about a mile seeing no game. Suddenly he stopped, hovered and suddenly shot downward.

The sharp crack of a twenty-two rifle split the silence and a woodchuck toppled over and began kicking. The boy was standing with his smoking rifle at the side of a willow bush when he heard a sharp hissing sound and like a flash down came the eagle and clutched the woodchuck and started away when again a sharp crack split the silence and he fell with a broken wing into the meadow.

Three more shots in quick succession echoed across the clearing and the eagle was no more. One of the bullets pierced its brain and now the bird adorns the wall of a certain farmhouse stuffed as it never was before.

The eagle's mate after flying over the main peak, flew down along the hogback at a height of perhaps a thousand feet.

She sent a piercing gaze down to earth,

taking in even a small chickadee chirping and hopping on the bushes. Suddenly she saw something that looked promising, so closing her wings hurtled downward straight as an arrow. A large brown snowshoe rabbit lay panting in the shade of a rock that harmonized with his coloring. A bunch of sage brush screened him on the other side, ten feet away. A brier bush grew at one side of the rock while overhanging the rock was a smaller slender birch tree.

But for the quick wiggling of his nose and heaving sides nothing seemed to be there.

A slight stirring in the sage brush attracted his attention and instantly he froze. Out stepped a large mountain blue grouse and strutted a few feet towards the rock then sat quite still its plumage blending with the ground to such an extent as to make it invisible.

A long gaunt mountain wolf loped along the slope and climbed up through the timber and presently emerged in a fairly open place among poplars and birches with little undergrowth. Through this he went quickly and silently, ever alert. Higher he climbed till he passed out of this and struck opener ground, a rocky and desolate area except for the mountain grouse, rabbits and small birds that inhabited it.

Just as he reached a large brown rock with brier bush growing beside it he heard a sharp crack as of a twig snapping under a heavy weight. Instantly he stiffened and sniffing suspiciously a smell of mingled rabbit, grouse and man smote his nostrils.

Joe, the poacher, and out of season killer plodded wearily down the mountain after an unsuccessful hunt for blue grouse. As he neared the brown rock he stepped cautiously for had he not shot more than one rabbit in the shelter of it. He watched intently, waiting for the least sign of game. A sharp hissing sound was heard over his head and looking up he was in time to see a black shape plunging downward toward the rock. Like a flash he brought his shot gun up. With an agonized squeal the rabbit sprang in great bounds towards the sage brush, colliding with the blue grouse just as the eagle clutched him. The wolf sprang in upon the eagle bearing him to the ground. There was a loud report, and a burst of shot hit the group one ball penetrating the eagle's neck close to the head, and killing him instantly. Another shot pierced the wolf's jugular vein inflicting a slow, but mortal wound, while others pierced his hide in various places. The

SARNIA **Limited**

grouse, unhurt, rose on thundering wings. The rabbit, more scared than injured, disappeared over the rise into the woods. The wolf sprang back over the rock, flattened to earth, and raced for the cover of the woods. The eagle lay whereshe had fallen. The man ran out from the trees and taking the eagle by its legs, raised it up and pulled out all its wings and tail feathers; then chucked it down again and walked on. The wolf having got clear

of the man began to feel sick from loss of blood so circled around and at length lay down under a stunted fir tree, not twenty feet from the dead eagle. A steady, if small, stream was trickling from the hole made by the B.B. shot in his throat. Soon his eyes lost their lustre and stretching out he kicked convulsively, then lay rigid. The wolf was dead and high over the hogback a raven croaked harshly.

Stick To It

"Bo"

Bad luck? No name for it! Here he'd been out after partridge two whole afternoons and not even a feather to show as a trophy. Jim, the farmer's boy, was certainly disappointed. He looked about as sad as the honorable Billhelm will when he orders his own funeral. But he didn't give up, not he. The never say die spirit was still dominant within him. "I'll get 'em yet" he muttered grimly and proceeded to finish the morning chores.

Dinner finished he left the table and took down his 20 gauge single shot shotgun, a present from an uncle who had gone out West. Breaking it he looked with pride down the inside of the barrel which was clean and shining. After putting some shells and a couple of big apples in his pocket he picked up his gun and left the house. Bill, the hired man, hailed him as he passed.

"Be careful you don't shoot anything" he said with a broad grin. Jim pretended not to hear him and strode on rapidly.

A walk of a few hundred yards brought the expectant hunter to the brush and he entered cautiously, picking his way to a small hill a short distance away. Once he stopped suddenly and looked up. He heard geese honking and presently saw the flock far above his head, coming from the north. After watching them for a few minutes he started forward again, being careful not to step on any twigs or pieces of bark that were on the ground.

Off to the left a chipmunk noisily proclaimed his presence but the boy did not stop for him. His .25 Stevens was better for that kind of game. Behind him he could hear the cow-bells tinkling softly as the cows moved about in the big pasture field behind the farmhouse.

Quit! quit! quit! Jim heard the warning note of the partridge and stood still. Again he heard the warning repeated and moved ahead, making not the least bit of noise.

"If I could just get to that little knoll I'd——"

Whirr-rr-rrr! The partridge flew away. Jim fumbled for a cartridge. Too late! A much surprised and startled partridge had disappeared among the trees.

"I'll be ready for him next time" he thought and put the shell back in his pocket. He went in the direction the partridge had taken but not seeing it went another way. Still he kept going, getting further into the bush all the time. When he came to a small rocky clearing, Jim sat down on a convenient log and ate one of the apples. Heading off to the right he went into the bush again.

Coming up to a small grove of evergreens he thought he saw a movement and stood still. He looked again. Yes sir! Not twenty yards away was a fine partridge! Quietly he inserted a shell in the gun, pulled back the trigger and raised the gun to his shoulder. The partridge strutting around proudly stopped for a moment.

The finger on the trigger tightened. Bang! The shot sped on its way, found its mark and the partridge toppled over dead.

Jim, proud, happy and excited, ran forward, picked up the bird and started for home. His feet were wet, and he was hungry, but he minded no such trivial things. "I should worry" he said to himself and hurried still faster.

His smiling face as he entered the door told his story even before the partridge was noticed.

And the partridge dinner—Yum! Yum!

Duck Shooting in Alberta

"CALGARIAN"

WHIR, whir, whir!—a reverberation as of thunder, moving thunder that is full of a thousand crashes. There is nothing like it in the world—the sudden rise of a myriad of ducks in the first dawn of the opening day. At that great moment duck fever is liable to tackle the oldest and most steadfast of our hunters in Canada. Even R. G. Robinson, the daddy of them all, or Ben McLaren, or Big Bill McLaren, with his 350 pounds of bone and muscle, or the cool-eyed Alex. Martin—anyone is liable to fire wildly when the inaugural boom of mallard, grey duck, teal, widgeon, redhead, spoonbill and pintail fairly shakes the morning air. It is not so much that the nerves are shattered as it is the exhilaration of the moment.

Man, red-blooded man, is in his element, with a gun and a dog, and with the ducks a-flying. Keen eye, alert mind and quick muscles co-ordinate to bring down the 90-mile lightning express of feathers, flesh and bone that whizzes through the air forty or fifty yards away. That is, it is forty or fifty yards away for the fraction of a second. The next fraction, it is out of range.

But to get that brief shot the hunter will stand up to his waist in water—with waders on to be sure—for many hours. He will go without food, without drink, without sleep, and even without his beloved tobacco, to get that instant's chance to measure skill with the hurtling duck. Even if he does not dust a feather, he counts the duck-hunting day one of the finest of his existence, and lives it again and again in memory.

There is no sport like it. It broadens the mind, strengthens the muscles and gives zest to this old world such as few other things can give. A man in love feels pretty good, so it is said. He looks through rose-colored glasses, and is alleged to be, for a brief space, the happiest mortal under the sun. He says so himself. But lead him to a confirmed duck-hunter, Harry Ford or Frank Coyle, for instance, and they will smile tolerantly, and perhaps there will creep into their manner a shade of superiority, for, after all, what is the pleasure of being in love to that of hunting the festive duck in his favorite marshes and sloughs and nicking him at 40 or 50 yards with a well-timed shot? That is the life, and there's nothing to compare with it, say they and so says every other devotee of the sport.

Why, here in Calgary there are many men who look to the duck season all the rest of the year. They do not exactly live for it, for they are invariably the finest of our citizens—big-hearted chaps of the purple-blooded line of sportsmen who have varied big interests. Honestly, they feel sorry for the fellows who do not shoot, for the men who miss the gorgeous dawns when the ducks fly low and fast, and the twilight shadows when the big birds come tumbling in like black cannon balls from the north. And then thermos of coffee and the duck sandwiches which top off a perfect day.

They can talk about golf and the electric sensation of a strike by one of Larry Larmour's bull trout, or walloping that old baseball square on the beak for a homer or a raise in salary, but, oh man, they are flat, stale, tame and insipid alongside the sensation that comes from a nifty double on a pair of mallards burning the air at anything above 60 miles an hour.

"How much did you lead him?"

"Was that bird in range?"

"Dashed if I didn't strain my gun going after that old drake. Couldn't tell till he was 250 feet above me." (Remember the clear air of Alberta is deceiving, and leads many a shooter to take a crack at a duck that is nearly a quarter of a mile out of range.)

"Blamed if I was on today. Couldn't get the range. Shooting behind 'em all day till near night, and say, did you see me drop that brace? Some shooting there, boy, some shooting. I jumped my lead about two yards, and they just naturally walked into the shot. Clean kills."

"Say, I remember when Charley Stone up at Carstairs shot his gun off by the ear of that guy in the black suit who came over and sat in front of his choice blind. We certainly miss that boy."

"And believe me Col. Walker was a real shooting guy. Never missed the opening day, and brought them down, one-two, one-two, like he was learning the two-step."

"Tappy Frost is some artist with the gun too. Trouble with him is that he holds his little old firearm too loose, and it's like to kick him to pieces. He showed me his arm one night after bringing in a bag of 62, and he was black and blue from his wrist to the back of his neck. He declared to goodness

Klim

THE BIRMINGHAM SMALL ARMS COMPANY, LIMITED

Canadian Representative—

FRASER COMPANY

10 Hospital St., Montreal, P. C.

that he never knew where that gun was going to hit him next."

And so the reminiscing goes on while the auto purrs homeward. It is indeed the life.

And now, a word of warning. Take plenty of ammunition. It is one of the saddest experiences in life to run out of shells just when the ducks are flying free.

Take your time on the bird, and get the lead right. It is far better to be too far ahead than too far behind. A leading shot may carry a few straggling pellets that will bring down your bird, even if the main charge is too far ahead, but when the shot is behind there is not even this remote chance. The best of our shots declare that their great mistakes are in not leading enough and in shooting too low. Give your bird a good lead and raise a little, and your bag will be heavier.

Respect the other fellow's rights. If you intend to shoot on a farmer's slough, go and ask his permission. Alberta farmers are the most reasonable chaps in the world, but they want to know who is shooting on their land.

They figure that the man who shoots without asking them is the careless chap who puts a charge into their cattle or horses, by mistake, of course, but the weapon is no less lethal because an error is made.

If another fellow is shooting on the slough, keep out of range and keep under cover.

Keep off the skyline, and wear a grass-colored suit. Khaki is the best color.

Remember that the duck can see a great deal further than you can, and keep under cover always.

Do not be impatient. Let the other fellow stalk from slough to slough. He will scare up the birds for you to shoot. Patience is 50 per cent. of duck shooting.

Keep your gun well oiled, and tighten up the screws before every trip and while you are out. Keep a little screw driver in your pocket.

There's nothing to beat a thermos for the end of the day or in the early morning.

And for advice, ask any of the men in the stores that handle sporting supplies.

They will give you the right information.

A Rabbit Hunt

K. LAWRENCE

BEFORE starting to tell you of one of my rabbit hunts I will describe what I consider necessary to successfully hunt rabbits. First thing is a good ferret, which must be trained to go in the rabbit hole and drive the rabbit out. If it kills the rabbits in the hole it should be muzzled. Some hunters break the tusks of the ferret. This is not a good plan, however, for it hurts the ferret's mouth.

Then a good dog is necessary. My dog is part foxhound and part beagle. He is a very good hunter and once he gets on the track of a rabbit he is almost certain to catch it or chase it to a hole.

The last thing that is necessary is a shotgun. A double barreled gun is preferable because if the first shot misses another shot can be fired within a few seconds. A single barrel is also good but not so good as the double barreled weapon.

On one of the most enjoyable days I ever spent hunting I started out early in the forenoon with my dog, ferret and gun. A good fall of snow during the night had made an ideal day for tracking rabbits. About

a mile behind our farm is a large woods. As soon as we got into this, Bob, my dog, started on a track. I went a short distance into the woods and sat down on a log. Soon I heard Bob barking and knew he had run a rabbit in a burrow. I went in the direction of his barking and found him standing at the mouth of a rabbit burrow. I then called him back and placed my ferret in the hole. Soon I heard a rumbling in the hole and a rabbit jumped out, followed soon after by my ferret. I let it get about twenty yards away before firing. It was running so fast that I would not have been surprised if I had not hit it. But as luck would have it the first shot I fired killed the rabbit.

Cutting its head off I put it in my game bag and resumed my hunt. For about an hour I tramped around the woods without seeing a rabbit. I grew tired of hunting in this woods and decided to try my luck in a field covered with underbrush. Here tracks were very numerous and it wasn't long until I saw Bob chasing a rabbit. Evidently the rabbit had not seen me as it was running straight for me. I fired at it when it was about thirty yards

NORTHERN ONTARIO

This vast new land of promise is one degree South of Winnipeg, and is big enough to include the six New England and four Middle States of the American Union.

Aside from its immense resources in timber, mineral, waterpower, fish, game and scenery, NORTHERN ONTARIO contains millions of acres of fertile, arable land fit for mixed farming which may be had by returned soldiers and sailors in 160 acre blocks free; to others, 18 years and over, 50 cents per acre.

Already there are thousands of miles of colonization roads and steam railways spreading like a spider's web over a huge part of that immense forest-robed territory.

away and missed. It then ran around through some underbrush and managed to make good its escape.

I knew where there were some rabbit holes in the field so I decided to try these. The third one I put the ferret in I heard a rumbling. I placed my hands over the hole and the rabbit jumped right into them. I grabbed him by the neck and cut his head off.

Just as I had finished I heard a whistle. I whistled back and soon a farmer's son whom I knew joined me. He had a dog with him and a ferret. We sat down for a short time

and talked. Soon we heard his dog barking and made haste to where he was, expecting to find him standing near a rabbit's burrow. Great was our surprise when we found him standing at the foot of a large tree. A large coon was sitting on a limb far up in the tree, but at the first shot from my shotgun he tumbled to the ground to be pounced upon by the two dogs. We hunted for the rest of the morning, my chum's dog catching one rabbit. As it was getting near noon I decided to go home. I skinned and stretched the coon before dinner.

Hunting Ducks in Bygone Days

ROBT. H. MACNAIR, M.D.

THERE was once a famous duck bagger named Wall, generally known among his associates as "that fellow Wall." Wall was quite an oddity but he brought in many wild ducks.

On a certain dreary, drizzly December morning I was invited to join him for a go at the "quackers," out toward a great flat country well stocked with feeding places for the wild mallards, etc., and at certain intervals there were wide pools of water fringed with wild rice and thick growths of the buttonball. The latter in many places afforded excellent stalking covers. The usual very effective hunting stunt practiced by Wall was to get in the first as a pot shot, when the ducks were well bunched on the water and then put in a wing shot as they arose. I had known this great greedy beggar to slay ten or a dozen duck with a big ten bore muzzle loader with the two shots.

Just as we were nearing the ponds one drizzly December day when it was necessary to keep the fowling pieces well covered about the percussion caps, we heard the lusty quacking of an old green head.

"Never mind, I'll be with you in a little while," was Wall's reply to the mallard drake. As we neared the first pond on our visiting list (there were about six in all) travelling very cautiously, a nice bunch of blue wing teal swooped down over us in beautiful range going straight to the pond. Involuntarily my gun went up but only to be stopped by Wall.

"You'll spoil the whole d— business by shooting now," he complained.

I had for the moment forgotten that I

was hunting with a typical "game hog" of the old days but for my own sport had far rather gotten in a double at the flying teal.

However, our stalking was very successful and there just within good range sat a fine bunch of mallards. Wall was just a little in the lead and as he turned his head to invite my participation in the murderous pot shot, my chicken heart and love for sport interfered. I motioned to the potter to shoot on the water and that I would come in a wing shot. We bagged nine ducks and I only succeeded in getting a double from the wing, but to anyone but a game hog the latter method should have been the most enjoyable, hence I was satisfied for that occasion. We hunted hard throughout most of a typical day for duck shooting. Our success was very good indeed but what rather spoiled the pleasure of the outing for me was that my friend, the G.H., seemed unable to get beyond the point when he could stop saying "just a couple of more shots."

Finally as we were nearing the last pond on our circuit—the day was very nearly done—down swung a handsome flock of mallards. Wall became excited, probably from the fact that he would not get the two more shots—and missed both barrels. However, the ducks circled and lit in the far end of the pond, affording an excellent stalking place.

"Golly man! I have used up every d— bit of my wadding. I haven't even a piece of paper and I haven't time to stop and cut off the end of my shirt. I didn't wear socks in these boots. What a fix!"

My gun was twelve gauge, besides I was out of wadding that was not ruined by the

constant rain. Diving thumb and index finger into a watch pocket, Wall suddenly exclaimed:

"Golly, I found the paper." The paper, however, proved to be an old two dollar bill. Without a second's hesitation the G.H. ripped the old green in half and used it for wadding.

With that expensive charge he bagged first four mallards that were sitting on the water just before the roosting hour. Expensive shot, some good sports may think. Well, not so very when Wall could count upon selling out his bag at one dollar a pair. Besides

he had enjoyed an immense day of duck-shooting sport and had some fifteen quackers about his person.

Not frequently during our present era of conservation laws I have had some amusement in recalling this episode of hunting with a somewhat interesting character. But in fairness to my partner I may say that these were the days when no restrictions were placed upon a day's bag nor the manner in which the shooting was done. Wall at the present day may have been a really ethical sportsman had he lived and learned.

A Prophecy Fulfilled

Fraser River Salmon Threatened With Extinction—A Fateful Rockslide—American Inactivity

"CONSERVATION, OTTAWA"

Although reports from British Columbia indicate that the salmon pack last year was the largest on record, it must not be inferred therefrom that the salmon industry is still

the utilization of, the "pinks" and "chums," varieties of the salmon, for which there was no sale until the sockeye became scarce. The run to the Fraser during 1918, was "very

as flourishing as ever. The facts are, as reported by J.P. Babcock, Asst. Commissioner of Fisheries for the province, that the large pack is due entirely to the increase from, and

much the smallest ever known. The river may be said to be fished out of sockeye, and the run of pink salmon, which was not used previous to the war, is fast disappearing."

IDEAL MANUFACTURING COMPANY

264 MEADOW STREET

NEW HAVEN, CONN.

The sockeye commands a higher price than any other Pacific salmon and it is the salmon that made the Fraser River fisheries famous. The destruction of this valuable fish is exactly in line with a prediction made by Mr. Babcock, before the Commission of Conservation in 1917.

In the year 1913, a big rockslide, incident to railway construction work, occurred in Hellgate canon on the Fraser river. This slide was nothing short of a calamity to the sockeye salmon-fishing industry in British Columbia. All familiar with the conditions there know that a phenomenon known as the "big run" takes place every four years. Big runs occurred in 1905, 1909 and again in 1913, the fateful year of the big slide. In

"big run" has been wiped out and, now, all years are lean years for sockeye, so far as that district is concerned.

Another factor enters into the situation. The fishery might be perpetuated and in some degree restored if conservative fishing were practised and if sufficient fish were permitted to pass up to the spawning grounds. Unfortunately, Canada cannot of herself limit the fishing, as the sockeye, in its course from the ocean, passes through waters under the jurisdiction of the state of Washington. Canada has repeatedly manifested her willingness to enforce remedial measures.

Following an investigation in 1905, by a joint Commission representing Canada and the state of Washington, the Dominion offered

each of these years the run of sockeye was very much larger than in the intervening years. The phenomenon of the "big year" is due to the fact that the sockeye takes four years to mature. Thus, the fish of 1913 were abundant because of the abundant spawning in the year 1909.

The slide above-mentioned unfortunately occurred during a "big run" year. It so narrowed the river (see illustration) that the force of the water was too great for even the sockeye to overcome and they were unable to reach their spawning beds. The other illustration gives a glimpse of the crowds of fish held back by the obstacle. Although the slide was removed before 1914, it was too late to allow many fish, of the 1913 run to ascend the river, and, in consequence, most of the sockeye of that year failed to spawn.

It was feared, therefore, that the run in 1917 would be seriously reduced. The fear was only too well-founded. The pack for that year in the Fraser River district was only about one-fifth of that in 1913, and there is little doubt that the pack for 1921 will be still less. In fact, the phenomenon of the

to suspend all sockeye fishing in the Fraser River district during 1906 and 1908 conditional upon identic action by that state. The State Legislature refused to take the desired action.

In 1908, Great Britain and the United States concluded a convention providing for the protection, preservation and propagation of the sockeye, but the United States Senate, after years of delay, refused to approve the treaty.

This year, a new treaty is awaiting action by the United States Senate. It provides for an international commission of two Canadians and two Americans to make investigations and to make such recommendations governing the fishing as may appear desirable.

It is earnestly to be hoped that this proposed treaty will go into effect and that the recommendations will be acted upon. Otherwise, the Fraser River sockeye is simply threatened with extermination. Canada has done and will do all she can to preserve this valuable food fish. The fate of the sockeye lies in the hands of the state of Washington.

THE LARGEST IN OUR LINE IN CANADA

Mr. J. WARD WINS OIL PAINTING

As intimated in our August issue we are pleased to be able to announce a winner in the ROD AND GUN MECHANICS CONTEST. This contest, which was open to all readers of *Rod and Gun in Canada* opened in June 1918 and closed in July 1919. A splendid oil painting was offered to the reader sending in the best kink for the Department. Mr. Robert Page Lincoln, a well-known staff correspondent and editor of the Fishing Notes Department, was asked to act as judge and we publish his award as follows:

"The Kink by Mr. J. Ward in the February Number I have selected as the winner in the contest started in *Rod and Gun* in the June 1918 issue. I have selected this one for the simple reason that there are thousands sleeping out every year who do not know how to make a balsam bough bed; or who do make beds of boughs and sleep uncomfortably for the reason that the branches are not arranged right. Mr. Ward's arrangement is good and makes for a fine, springy, comfortable bed. Since this is a kink that will cause thousands to enjoy healthy sleep I think it is well worth the painting that the Publishers are donating to the cause of kinkship.

Robert Page Lincoln."

We would ask Mr. Ward to look over the covers of the past issues of *Rod and Gun* and make a choice of one of the cover paintings and we will be pleased to forward it to him.

USEFUL CAMP UTENSIL

Robert Hodgson.

The birch bark lantern shown in the illustration is very picturesque as well as serving

the purpose for which it is designed, that of light giving. First cut the bottom out of an inch board, boring a hole in same to hold the candle. Then cut the bark to fit well around

this bottom. Where the bark overlaps it should be sewed up, the sewed part being fastened on the bottom with tacks. Add a handle of leather, bark or other material and your lantern is ready for use around the camp.

NOTICE TO FRANK BICKNELL

Will Mr. Frank Bicknell, whose inquiry re a Winchester '95 appeared in the July issue of *Rod and Gun*, kindly send his address to the office of *Rod and Gun in Canada*, Woodstock, Ontario.

About Your Own Vigor Sent Free To Men

MR. READER:

Here is something I have to offer you absolutely for nothing—a little private book of special information about the legitimate uses and unnatural abuses of manly vigor; about the preservation of manly strength and its possible self-restoration; an illustrated pocket compendium of 8,000 words, 72 pages and 30 half-tone photographs, reproductions—which I am very pleased to send by mail, absolutely free of charge, in a plain, sealed envelope, to any man, young or elderly, single or married, who writes for it.

Over a million of these books have been thus sent to applicants all over the world since my free offer first appeared. Publishers are charging as much as \$2 for books on sex subjects, while my book is free. Therefore, reader, if you would like a great fund of inside information relating directly to the subject of manly vigor, all put in perfectly plain, easy-to-read language, with many hints that you can surely apply to your own self no matter how strong you may be, or how nervous or run-down you may be—if you want to know the facts about this particular subject, given to you without a single scare, then fill in the coupon below, send to me and receive my book, sealed, by return mail. In one part of this little publication I describe a mechanical invention of my own, which I call the SANDEN Vitalizer, something you wear at night as an aid to the restoration of lost or waning strength; but you are not expected to get one of these appliances unless you decide for yourself that you want one. The book is complete, and there is absolutely nothing you are required to buy or pay, either now or in the future. Therefore, please send your name and address to-day. SANDEN, Author.

MANHOOD! The quality which rules the world to-day. My friend, there never was a time in the history of the human race when real, sturdy manhood, manly vigor and manly courage counted for as much as they do now, this very minute. No matter what your years, whether you are 20 or 60, you must be either entirely in the race or entirely out of it. It is invariably the fellow who proves up the strongest in this human strength that forges to the front, while weaklings stand aside; it is he also who is in most demand and most sought after by women and men in his community, simply because he radiates that marvellous magnetic influence which only an abundant vigor and rugged manly health can radiate. I believe any man can hope to completely develop or restore this same vigor of manly strength, no matter what his past follies may have been, provided he is willing to **REALLY MAKE THE EFFORT**; and provided, of course, he is not weighed down by extreme old age or is not incurably diseased. To my mind, the road of the one who wants more vigor is perfectly plain,

Manhood Wins in All Walks of Life

but it is a road that any man **MUST** travel if he attains the highest ideals in respect to his own manhood. See information in my free book.

As to the SANDEN Vitalizer, previously mentioned, will say it is a little mechanical appliance, weighing but a few ounces, which you wear at night. This Vitalizer generates and sends forth a certain soft, penetrating force which I call Vitality. It apparently drives this Vitality into your nerves, blood, muscles and organs as you sleep. It is quieting to the nervous system—or, at least, so users say. Men write that it takes pain out of the back and restores vitality in 90 days. Remember the general information of the free book is independent of this Vitalizer, and you are not expected to get one of these little appliances unless you want to. You can write me later as to that if you so desire. With special attachments, my Vitalizer is used by women as well as men for rheumatism, kidney, liver, stomach, bladder disorders, etc. If you live in or near this city I should be most pleased to have you call in person at my office, where you may see and test the Vitalizer free of charge. Satisfaction guaranteed in every case. Or if inconvenient to call, do not fail to write for the free booklet.

TO GET FREE BOOK PLEASE USE COUPON

If you live too far to call, or if you cannot call, please fill in the coupon below and send it. You will receive free, sealed, by return mail, our 72-page illustrated book, containing 8,000 words, a complete compendium of useful information for men, young or elderly, single or married, who want the truth about the subject of vital strength, its preservation, its possible self-restoration and its legitimate uses and wanton abuses. You get it all free.

R. G. SANDEN CO., 140 Yonge St., Toronto Ont.,

Dear Sirs—Please forward me your Book, as advertised, free, sealed.

Irish Rifle Association

Annual Rifle Matches, August 4th

J. W. SMITH

THERE were over one hundred entries in the Annual Rifle Matches held by the Irish Rifle Association on August 4th at the Long Branch Ranges near Toronto, and the event was an unqualified success. The Match Committee, under the capable leadership of the popular president of the Association, Captain Dave Spence, had made perfect arrangements for carrying out the program, and the various events were shot off with a smoothness and precision which elicited favorable comments from both competitors and spectators. The weather was bright with a light east wind which remained fairly steady all day, creating ideal conditions for good shooting.

During the afternoon, General Gunn and General Mitchell watched the proceedings for a while, and were very favorably impressed with the manner in which the shoot was being conducted. Colonel F.W. Brown, the founder of the Association, was also an interested spectator, but did not take an active part in the matches. Several marksmen, whose names are famous in the annals of the sport of rifle-shooting were to be seen among the competitors. The duties of Range officers were efficiently carried out by Captain A. E. Gooderham, Captain E. H. Price, and Mr. W. J. Kingdom, and the success of the meet was largely due to the capable manner in which they did their work.

The General Match Aggregate was won by R. Storrar, a member of the 48th. Highlanders and the I.R.A., with a score of 101. R. Williams, of the Queen's Own Regiment was second, his score at 600 yards being one point less than that of Storrar. No less than five men made the creditable score of 100, the best being that of E. Edmond, who hails from Australia, and is a member of the 12th. York Rangers and the I.R.A. This is Mr. Edmond's first season in this country, and he is considered quite an acquisition to the sport in Canada. T. W. Younger, of the Grenadiers, and the I.R.A. was most unfortunate in making the splendid score of 102, which was ruled out by his failure to properly challenge a shot according to the O.R.A. rules, under which the meet was conducted.

The Extra Series Aggregate was won by

W. A. Hawkins, member of the 48th, Highlanders and the I.R.A., and well-known as the winner of the King's Prize at Bisley in 1913. J. E. Fitzgerald is one of the newer shots, and belongs to the 110th Irish Regiment and the I.R.A. G. W. Bull is also one of the newer marksmen, and has been shooting consistently well this season.

One of the features of the matches was the fine form shown by marksmen who will rank as tyros in the coming O.R.A. matches, and it is expected that these new men will carry off many of the honors at the matches in August. An account of this shoot would be incomplete without mentioning the invaluable work done by the captain of the Association, A. Emo, ably assisted by his lieutenant, S. Dean, and the two other members of the Match Committee, R. W. Murray, and J. Sharp. Credit is also due to the majority of the members of the Association who worked hard all day as register-keepers, and competed in the matches at the same time. The following shows a complete list of the prize-winners with their scores—

FIRE DESTROYED GAME.

Writing from Midnight Lake, P.O. Sask. Mr. B. W. Broatch tells of the awful damage done during the recent holocaust. He says in part—

"I have just been over a few hundred square miles of the fire swept area trying to locate a good hunting ground for this Fall. Found a good sized tract (about 20 sections) that the

fire missed. Moose tracks were plentiful so I conclude there will be some moose left in the unburnt patches. I saw plenty of deer.—

The fire made an awful wreck of our northern woods, and must have wrought terrible havoc on the game too. One can ride for endless miles without seeing a living thing.

Sincerely yours,

B. W. Broatch.

Canadian Makes Good at Chicago

Joe Jennings, Second Place At Chicago.
Frank Troeh Makes World Record.

Chicago, Aug. 12.—New records for the American amateur trapshooting championship and the professional championship of the Grand American Handicap Tournament were established late to-day, when the winners in the respective events. Frank M. Troeh,

Vancouver, Wash., and Bart Lewis, Auburn, Ills., broke the entire 200 targets thrown.

Never before in competition from eighteen yards had the entire program been run without a miss. The best previous performance at 18 yards was by Troeh here two years ago, when he won the event with 199 out of 200.

J. E. Jennings of Todmorden, Canada, was second to Troeh, with 198. He ran 140, and then missed a pair, finishing out his string without a miss. W. Henderson of Lexington, Ky., champion of that State, and T. L. Edens, Phoenix, Ariz., Arizona champion, tied for third place with 197. Henderson won the place in three shoot-offs, hitting all twenty targets, after each had made 20 and 19 in the first two.

For the professionals, Charley Spencer of St. Louis, Mo., and Fred Gilbert, Spirit Lake, Iowa, each broke 198 targets, with William Crosby, O'Fallon, Ills., next with 197.

The squad in which Troeh shot, composed of Mark and Nick Arie, Chas. Powers and E. V. Kirby, broke 977 of 1,000 targets thrown. That was also a new world's record for 18 yards. It also surpassed any shooting ever done from 18 yards by a squad of five.

Other Canadians who finished in the first flight in the South Shore Country Club event, with their scores, are as follows:

Norman Brownlee, Ottawa, 97; W. H. Gooderham, Toronto, 94; W. H. Hamilton, Winnipeg, 91; Ted Kerr, Crediton, 94; J. Vance, Tillsonburg, 85.

"MODEST" FRANK WRIGHT AMATEUR CHAMPION.

Winner at St. Thomas, Won Amateur Singles Championship.

Chicago, Aug. 13.—Frank S. Wright, champion of New York, won the American amateur trapshooting single targets championship to-day after a tie at 199 out of 200 with R. D. Morgan, of Washington, champion of the District of Columbia, and John William Akard of Fairplay, Mo.

On the shoot-off of 25 targets Akard missed the 13th and was eliminated. Morgan missed the first on the second shoot-off, while Wright ran his second 25 straight making a total of 249 out of a possible 250.

Nick Arie, Menard, Texas, won the American amateur championship at double targets with 91.

George Andrew Miller, a ten-year-old Brewton, Ala., lad, the youngest competitor, won the junior championship with 49 out of 50, and Andrew Mayer, Madison, Wis., 71 years old, won the three-score and ten championship.

Successful Shoot at Peterboro'.

The Port Hope and Lakefield Gun Clubs paid a visit to the local Gun Club's grounds.

There was a very high wind and it made the shooting difficult, but some very good scores were made.

H. Reynolds and R. S. Watson, of Port Hope, and Roy Hutchinson, of the home team, were high guns with scores of 41 each.

The Port Hope squad won the team shoot for the cigars with Peterborough two birds behind. Mr. Reynolds won the blind handicap with 22 and T. Curvin and Chris. Graham were tied for second with 21.

The Port Hope Club is shooting fine and sent up two squads. Lakefield had a nice turnout of gunners and are doing great work for a new club.

The executive of the Peterborough Club were delighted with the number of shooters who attended the evening's sport, there being twenty-seven.

Return visits will be made to Port Hope and Lakefield in the near future.

Hamilton Gun Club.

The regular shoot was held at the Hamilton Gun Club on July 9, and the cooler weather must have been conducive to good shooting, judging by the scores made. The main event of the afternoon was a 25-bird merchandise, and the scores in each class ran very close.

In A class H. Lennox and N. Long tied for the lead with 24, and, instead of shooting off the tie, the coin was flipped, H. Lennox coming out the lucky one. E. Harris and E. Sturt were both close up with 23, while Geo. Beattie, W. Barnes and C. Thompson all had 22 each.

J. Smith sprang a surprise in B class and put on a 25 straight, thereby winning the prize, but even then only nosed out Geo. Stroud, who broke 24. A. Parmenter and Dr. Greene each got 22.

In C class A. Smith came out the successful one with 20 out of 25, but was followed very closely by A. Glover with 19, and J. Moyer, who had 18.

H. Lennox shot only the one event, but had the high average with 24 out of 25. H. Barnes was in good form and broke 118 out of 125. Third high average honors were won easily by M. E. Fletcher with 92 out of 100, E. Harris with 46 out of 50, and N. Long, who also had a good run of 115 out of 125.

RUNNERS UP FOR CANADIAN CHAMPIONSHIP.

Although not quite good enough to represent the Dominion at Chicago, the runners-up for Eastern and Western Canada displayed considerable class as shown by their scores:

Western Canada—J. A. Black, Winnipeg—282.

Eastern Canada—William Barnes, Hamilton—286.

CANADIAN REPRESENTATIVES AT CHICAGO.

Dominion Shooters were ably represented at Chicago by the champions of Eastern and Western Canada. Their scores which qualified them for entry as Canadian Champions compare favorably with those of the various state champions with whom they competed. Scores made in winning the title are—

Western Canada—W. M. Hamilton, Winnipeg—288.

Eastern Canada—S. G. Vance, Tillsonburg—290.

IN LEADING FIFTY AMATEURS

Included in the leading list of fifty amateur shooters of America, who have broken over 1000 targets is J. Wesley Hart of Dresden. Mr. Hart holds 31st place having broken 1104 out of 1150, giving him an average of .9513.

HAMILTON GUN CLUB

July 12th.—The first shoot of the season at Dynes Beach park, was run off on Saturday, and good scores were made. John Hunter won the prize in the first event with 25 straight, B. J. Pierce won the sweepstake with 24 out of 25. Watson, Choate and Jones taking second money with 23 each, Nelson Long, the local professional was high gun for the afternoon with 73 out of 75, smashing the last 61 straight.

Name....

Address.

this event proved to be the banner attraction of the year. The scores made by some of the ladies certainly set a mark for even the male members of the club to look up to.

In the first event of 5 birds Mrs. Lennox and Mrs. Harris tied with 5 straight, while right behind them were Mrs. Lutz, Miss Hunter, Miss Ecker, Mrs. Stockford and Mrs. Livingstone with 4 out of 5. In the shoot off Mrs. Lennox again broke 4 straight carrying away the first prize, while Mrs. Harrison took second prize, having gotten 2 out of 4. In the shoot off for third place Mrs. Lutz and Mrs. Livingstone again tied with 4 out of 5, Miss Ecker and Mrs. Stockford getting 2 and Miss Hunter 1. By this time the excitement was running high and Mrs. Lutz ended the battle by breaking 5 straight and Mrs. Livingstone got 4. Other scores were Mrs. Choate, Miss Harris 3 out of 5 and Mrs. Taylor, Miss Fletcher, Miss Long, Mrs. Fell, Miss Howsego and Miss Devine 2 out of 5.

One of the other pleasing features of the afternoon was a 25 bird race for the men, each lady present having drawn a ticket of the name of one of the contestants, two handsome prizes being given to the ladies holding the winning shooter's name. A surprise was sprung in this event when W. Livingstone put on a straight score of 25 and tied with G. Beattie for the lead and then went right back and in the shoot off scored another straight, while G. Beattie broke 24. Mrs. Dr. Groves held the winning ticket and Miss Ferguson received second prize.

There was also a consolation drawing for those ladies who had not won a prize in the other events, and in this Mrs. Shepherd proved the lucky one.

During the afternoon dainty refreshments were served by A.B. Crawford after which the prizes, consisting of beautiful cut glass were presented to the winners, everyone then leaving, pronouncing the afternoon a grand success.

The scores of the men were:

The Ithaca Gun Company have placed a splendid single barrel trap gun on the market. They have named it the Victory Grade and have produced a well made, 12 gauge gun at a remarkably low price. Standard specifications and quantity production allow them to offer the Ithaca Victory Grade at a figure that will allow the man of moderate means a chance to purchase a gun that will "bust 'em" with any of the higher grade guns. With a 34 inch barrel the Victory has racy lines that will appeal to all lovers of good firearms.

HELP PREVENT FIRES—FOLLOW THESE RULES.

1. *Matches*—Be sure your match is out. Pinch it before you throw it away.

2. *Tobacco*—Throw pipe ashes and cigar or cigarette stumps in the dust of the road and stamp or pinch out the fire before leaving them. Don't throw them into brush, leaves, or needles.

3. *Making Camp*—Build a small campfire. Build it in the open, not against a tree or log or near brush. Scrape away the trash from all around it.

4. *Leaving Camp*—Never leave a campfire, even for a short time, without quenching it with water and then covering it with earth.

5. *Bonfires*—Never build bonfires in windy weather or where there is the slightest danger of their escaping from control. Don't make them larger than you need.

6. *Fighting Fires*—If you find a fire, try to put it out. If you can't, get word of it to the nearest forest ranger at once.

The above rules for the prevention of fires, prepared by the United States Forest Service, are equally applicable to Canada. Their observance would go far toward lessening the tremendous toll taken each year by the forest fire fiend.

ENQUIRY CONCERNING THE LAKE OF THE WOODS.

Editor:—

I spent ten days on Lake of the Woods last year during the last two weeks of October. Business will take me to that region again this fall and I would like to time my visit so that I may take advantage of duck hunting. Perhaps you or some of your correspondents may be able to tell me the most favourable portion of the lake for hunting and the best time of the season to go there either for mallard or the late fall duck.

I shall greatly appreciate any information.

Yours very truly,

J. B. A.

Open Seasons for Game in Canada and Newfoundland, 1919

Compiled by GEORGE A. LAWYER and FRANK L. EARNSHAW
U. S. Dept. of Agriculture

THE OPEN SEASONS HERE SHOWN ARE INCLUSIVE OF BOTH DATES. When the season is closed for a fixed period the date terminating the closed season is given.

The term rabbit includes "hare;" quail, the bird known as "partridge" in the South; grouse includes Canada grouse, sharp-tailed grouse, ruffed grouse (known as "partridge" in the North and "pheasant" in the South), and all other members of the family except prairie chickens, ptarmigan, and sage hens; introduced pheasant is restricted to the Old World pheasants.

PERSONS ARE ADVISED to secure from Provincial game commissioners full text of game laws in Provinces where hunting is contemplated, as provisions of minor importance are omitted.

**Under the regulations for the protection of migratory birds the season is closed on swans, wood duck, cranes, curlew, willet, godwits, upland plover, and all the smaller shore birds in the United States and Canada, and on band-tailed pigeons in the United States.

ADDITIONAL PROVISIONS AND EXCEPTIONS.

British Columbia.—Open seasons on game fixed annually by Order-in-Council which will be available from Secretary, Game Conservation Board, Victoria, B. C., after August 15, 1919.

New Brunswick.—*Deer*, on Grand Manan and Campobello Islands, no open season.

Read This Great Dog Story!

A TALE OF THE NORTHERN WILDS

In the old Klondike gold rush days, Jack, a full blooded Airedale terrier, followed his master up from The States, to Dyea and Skagway, to Dawson—and to Nome. Up back of Nome he died—to save the life of the master he loved.

This great story, which will bring tears to the eyes—yet gladness to the heart, is one of the most truly realistic animal stories ever written. Very handsomely and attractively bound in cloth and extensively illustrated.

OUTDOOR BOOKS

By Warren H. Miller

Editor *Field and Stream*

The Outdoorsman's Handbook

Everything for the hunter, wing shot, fisherman, camper, canoeist and dog owner, condensed into compact, handy reference form. In canvas binding, \$1.50; with a year's subscription to Rod and Gun, \$2.25.

Camp Craft

The latest and best of camping books. 282 pp., profusely illustrated. All the modern camping equipments that you do not find in earlier works are described in this work. Cloth, \$1.50; with a year's subscription to Rod and Gun, \$2.25.

Rifles and Shotguns

Military rifle shooting, big game rules, and how to learn shooting at big game; sights, targets, rifle mechanics, trap-shooting, wing shooting, patterns, snap shooting, etc. A complete and authoritative work for the big game and feathered game hunter. Special chapters on the U. S. Springfield. Cloth, \$2.00; with a year's subscription to Rod and Gun, \$3.00.

The Boys' Book of Hunting and Fishing

With ten chapters on camping for boys. How to catch trout, bass and muscullonge, and the tackle to get that a boy can buy. How to learn wing shooting and rifle shooting. How to make your own camping outfit. Cloth, \$1.25; with a year's subscription to Rod and Gun, \$2.00.

The Boys' Book of Canoeing and Sailing

Has also chapters on the motorboat, besides many on canoeing, canoe cruising, how to build a decked canvas sailing canoe; boat-building and rigging for sail batteaux, dories, skiffs, duckboats, catboats and knockabouts. 350 pp., 127 illustrations. Cloth, \$1.25; with a year's subscription to Rod and Gun, \$2.00.

Airedale, Setter and Hound

With a chapter on the pointer and Irish setter. All about raising and training the principal breeds of hunting dogs. A thoroughly practical work. 160 pp., 50 illustrations. Paper, \$1.00; cloth, \$1.75; with a year's subscription to Rod and Gun, \$1.75.

The Medicine Man in the Woods

A pamphlet in waterproof pack-sack binding, covering emergency, first aid and woods' medicine. 50 cents; with a year's subscription to Rod and Gun, \$1.60.

No. 2---Canadian Natural History Photos

BONNYCASTLE DALE

Female Virginia Rail entering nest. This robin-sized bird has a booming note like a great horn as well as many low, sweet calls. It is too alert to be caught napping by a shooter unless in a wind or either early or late in the day when its flight makes it an easy shot for gunners.

Dredging Within the One Hundred Fathom Line

Written and Illustrated by BONNYCASTLE DALE

WE were off the lonely and isolated island called Forester, due north west of the big Queen Charlotte group in the Pacific. This is the most southerly of the group of islands lying just north of British Columbia. There was much confusion hereabouts. The Alaska Award line was being pushed north rapidly—and too far west we all thought for Canada's good. All the riff raff of the beachcombers of the Coast were flapping along under tattered and mildewed canvas, in homemade craft; of divers and weird shapes—and we felt and knew we would be "good picking" for any of these gentry—just a naturalist and a boy, unarmed at that. So I bought, for specimen work—and the pot work too, a Winchester Special, using .22 Special Long; and hung it on the wall of the shack—we went for a walk—so evidently did someone else for when we returned the rifle had walked off too. We at once tracked and traced a passer-by and off we set for the nearest "Il-la-hie" or "summer grounds" of a wandering fishing tribe. One member I knew slightly and it had been he who had passed my shack.

"I-lost-rifle-this-morning-stolen. If its not laid down by twelve I bring police in." I told him. I knew they were in great fear of the deep sea patrol that was hunting some desperadoes along this coast—still he could have popped us both over and it is a question if our bodies would ever have been found—still the bluff work-

ed, and he was at my shack almost as soon as we were.

"What side you look?" I asked him in Chinook, still pretending to find a lost rifle.

"O-koke" ("this" he answered) then I knew it was on the *other* and started to look.

"Wake Kloshe" ("no good"), he said after a long hunt and changed sides. Pretty soon he grunted in surprise and I went over; and there was the innocent little rifle hiding there in the ferns. I praised him for "finding" it, told him I would put a man in Skookum House (jail) next thing I lost. Then he slyly asked me "If I missed anything else," "No" I told him and off he slouched.

Laddie, Jr., a short time after, went over to the pile of boxes of shells—too light—all emptied and put carefully back in place. We had bought a few hundred, as we kill our geese and brant with the rifle; and Tzum, as he was called—had Tzumed the whole pile.

"Here comes the Nan-itsh!" said Laddie, Jr, and the new boat we had hired came puffing into the wee harbour. Translated she is "To-Seek" —I hope she does. All the boats we had used before seemed to just glide from the arrival to "Pay-me-Now," from the Jap, or Dane or Swede skipper. I guess they had had uncertainlessees before, as they always looked relieved when I promptly paid them. The Captain belonged to the "I ban do it" tribe I think, as he always used these words. I explained

The Dredgers

several times that we just wanted to dredge for a few days in fifty fathoms and he always figured—"One day-ban twenty-five"—"two ban two twenty-fives," and so on and so on. He couldn't get far away from that daily price of his Seeker.

So behold, Laddie and I and "Ban" as the boy called him and "Chew-it-all" as Laddie called the other tobacco devouring individual. He was actually polite, always pushing me carefully aside so that he might spit to leeward.

"I ban starting!" said the Norseman "Ting-a-ling" goes the bell—no start.

"Ole--le! Ole--le!" he yelled. "You stay mit the engine." and off we puffed.

Now it needed both the men to get our big heavy drag-purse over, a net bag twenty by ten; with a ten by two iron frame open mouth. A "splash!" down she sinks and we are at last really dredging again. I just want to remark that dear as the opening day of shooting or fishing is to the devotee of gun and rod, so is the first appearance of the dredge above water on our first day to us.

There was a dull oily roll in from the restless Pacific, just enough to make one sleepy this bright young summer day, the soft coal smoke blew all about us and half drowsed us too when "bump!" went the "gate" far below and "Ollie" rushed up and back. "She got stuck!" he yelled. Away he darted like a madman, put the engine backing against the run

of the tide and soon the big purse mouth rode the boulder and on we went—at about a mile an hour gait.

"Stop!" signalled the Captain—and the drag rope was put on to the winch and up came the purse—bellying out behind—now the men seized the slack and hauled out—and we fell on our knees examining. Evidently we had struck a mass of great polyps and gone right through their peaceful sea villa and scooped them all. There was a mass of sea pumpkins as big as toy balloons, almost transparent and coloured as fantastically as the lanterns about a Chinese Joss-house, great trembling masses of green and gold and purple and wondrous varicoloured jelly—with their stomachs and interior departments plainly in view of their neighbors. You would wonder how they eat and breathe. What a sight of magnificence they must be in their deep homes when I tell you that some are illuminated by a wonderful phosphorescence and others—I suppose—use the Gen. Seabottom Electric Light Co's radiance supplied away down there by countless millions of diatoms; each golden blue in its glow.

"Look out—bite," warned Ollie.

The lad was taking out a green and white beauty of a well shaped fish. "Rat-fish," again. "Lookout!" warned the Swede. I stripped the jaws open. No wonder they called it Rat-fish. Its teeth were fully an inch long; and wide white cutting chisels they were. We were long on Ratfish, must have had a thousand so we dumped them forthwith.

A netful from the ocean.

"Keep him!" both men burst out when I pushed many flapping Red Rock fish into the sea.

"Sell him—Prince Rupert," they told me—and I guess we confirmed their opinion of our madness when sea bass and cod, herring and oulicans, skate and flounder, halibut and rare mackerel followed suit—and we both loudly exulted over a strange thing called a Pompino, or dollar fish and speedily pictured the small, round fat fish.

"Here's a devil-fish," squealed the boy. "Oh I wish we had that fellow who wrote about them eating men here, we'd make him eat this, and he lifted out of the foot deep mess of squirming Marine Zoology—an octopus, a nice five foot long bunch of eight grisly arms hung down like so much gristle from the boy's landing net, the Nature Fakirs stretch the arms wide out and call this a "ten-foot-terror-of-the-seas." This one weighed fifty pounds.

"I want him," said Ollie, appearing with a big butcher knife, so we handed it over and he cut off the eight tentacles and it appeared at dinner that day—just a tasteless mass much like the thicker muscles of an oyster or clam—simply not worth eating.

Laddie Jr. burying a crab

A ninety-foot-long sea weed strong enough to moor a boat

"Sharks," cried the boy, a pair evidently of little fellows, delicately gray as Milady's gloves, all finned in wondrous manner from gillarch to tail, "snappy little brutes," quoth the lad, as one neatly engulfed a too inquisitive finger.

"Keep it in your own mouth now," he says I told him.

"Goot many tings!" said Ollie as we lifted out a mass of most excellent shrimps. I found three kinds here and we got a true shrimp later, the first three were prawns.

"Say! look at the live knitting needles," called Laddie Jr., as he picked up a group of polyps—each one almost forty inches long—just like a bone needle—Yes! white animal bone; and on the top a head as big as your finger and all luminous at night. "I'll bet they have a regular illuminated field of growing wheat down there when all the knitting needles are in position—and just think of a fish swimming through this phosphorescent mass down there and them all waving away as it passed. Oh! Joy," said Laddie, "And these are the things the Chinks eat," he said as he pulled out a ladle net full of sea cucumber, these long jelly-like, grisly things were most beautifully coloured—but excuse me from eating them please—I once had "blird nestee soup" and sea cucumber, and pressed oily duck served in a Chinese restaurant—and I guess they are there yet as I made a nice full meal off plain crackers. Thank you very kindly

I guess they didn't name this one," said the boy as he picked up a thing that looked like a Japanese puzzle made out of bone—another polyp,

a regular beautiful little bone basket, a real embroidery of bone.

The ooze, as you might call it of that first drag was a thing of wonder; we had animals so like sea weeds that we could not tell them apart—and sea weeds so like animals that no man may discover the dividing line—each a thing of wondrous beauty set away down where no man's eye should see it.—What is this scheme of things we call Life, anyway?

Day after day, hour after hour, so long as we could afford that "one-day ban-twenty-five-dollar-boat" we took of the treasures of the deep—and re-deposited them to the amazement of the wondering Norsemen. We could not have kept the perishable eatable part had we wished to do so.

"Throw him all out," lamented the loquacious Ollie—as net full after net full was carefully liberated. We were getting into deeper water now and odd anemone and rare sea whips and strange jellylike masses came in hourly—and at times dark strange shapes devoured them as soon as we liberated them, ground or basking sharks and some odd fluted tailed sharks. Yes! and the big mouthed cod were not averse to filling their stomachs with their late fellow captives.

"Whoop!" screamed the boy once as a great black shape suddenly rose near the dragging rope of the net astern, and a killer whale reared for a moment to sight. Once we ran into a stream of passing salmon with their attendant sea lions, long dim

shapes that swam just outside the school—and ate one every time they got hungry enough. We took one wolf-eel, he snapped and rolled and displayed his terrible mouth and crunched to fragments every mussel or giant cockle shell which the boy threw into his awful maw; he was fully six feet of weird sea life. We got tons of the rarest sea weeds, but alas! we were not preserving, only picturing.

We lived like lords on any and all the know dainties of the sea, but most carefully refused to serve any unknown bit of horribleness. At times, in the shallows, we took rare abalone and moonfish. These last were big shellfish as big as base-balls.

They can exude enough stick-em-tight to make any sea glue manufacturer die of envy—and they roll up and fashion out a nest that exactly resemble gray felt hats with the crown cut out.

At nights when we slept in the man nests made by those Norsemen, too short where they were long and too narrow where they were wide. I used to poke my head out for air, and all the tragedy of the sea was enacted in the moonlit waters down beside me—it seemed as if each chap ate the next smaller one with intense energy—and they literally smacked their lips over it. When one big ground shark came finning slowly along past the little Nan-itsh, and rolled and fixed me with its bright green little eye I withdrew in haste—you see I had not lost any sharks.

Squab Raising

In the present post war-time days, there is, of necessity, an ever-growing scarcity of meat, inasmuch as we are called upon not only to feed our own nation, but European countries as well. Therefore, any pursuits that will add to the fresh meat supply will be at once patriotic and profitable.

In view of this, squab raising should receive new impetus. At present most of the large squab-producing plants of the United States are found

near the larger cities of the Northeastern States and on the Pacific coast. However, pigeons are quite generally distributed all over the country. Many of them are kept on farms in the Middle West as a sort of side issue, also in the South, but the average value of pigeons in these sections is only slightly in excess of 15 to 25 cents apiece, compared to 40 to 55 cents and up, in New York and New Jersey.—T.H.H.

"We caught all the law allowed"

Under Canvas With Moses

or Luring Shigan, the Fighting Bass, in the Timagami Forest Reserve

J. LIVINGSTON

WE called him "Mose" but his name was Moses Missabi.

Mose was a full-blooded, blue-blooded aristocrat among the Ojibways who summered around Bear Island and wintered on the many lakes and rivers throughout the Timagami Forest Reserve in their quest for furs, which furnished them with the necessities of life, but in none too generous quantities.

Just how many summers Mose had to his credit we did not find out for he was as bashful as a maiden of sixteen years when it came to furnishing information, especially personal information. But we know that his father, Peter Missabi, was one of the most active guides around the Hudson Bay post, and as further evidence that Mose was far from being past his usefulness, that his grand-father, Daniel Missabi, a gray-haired old warrior of over one hundred summers, still tended to his potato patch on Obabika lake and paddled his own canoe to get there.

Mose was wife, guide, handy man, bull cook, wood chopper, pack-wrangler, canoe-carrier, piscatorial adviser, center piece for our pictures, fish-cleaner, general assistant, and all around companion of Bert Jackson and Mrs. Bert Jackson, who hailed from Akron, the rubber-town of Ohio, and myself, a humble, hard-working member of the fourth estate.

In addition to all this, Mose was my bed-mate and lying under canvas, with Wasa Te Bicon,—the northern lights—running through the skies like fingers of fire or again marshalling in serried array like soldiers preparing for the attack, we talked of many things, of life as observed from the view-point of a dweller of the silent north, and under the mystic spell of the lure of the out-doors struck many a responsive chord.

Mose told me how Pegigwani—the fish hawk—snatched his dinner from the placid-blue waters of Lake Timagami; how Ammek—the beaver—built his dams and floated his

fallen trees; how Keewadin Coocoo-coo—the great northern owl—whose “coo-coo-coo” often boomed down the lakes in the still of the night, terrorized the smaller animal kingdom; how Ma Quoit—the bear—was enticed to his doom by log-falls; and how Ojik—the fisher—fought to the death even when grips of steel were slowing pinching out life.

Grim tales of the trapping line, when starvation and cold were fought off at every step, when the grub was down and the spirit was low and every breath burned the lungs, were related in an unemotional vein as lying on our backs under the canvas, Mose blew out vast clouds of smoke from a well-burned pipe and I followed suit with “coffin nails.” Without knowing it, Mose painted word pictures of his world that defied the power of the brush or pen to reproduce.

But it was in the canoe that Mose reigned supreme. As he swung his paddle—silently but powerfully—through the water and applied the kick at the end of the stroke which fairly lifted one over the surface and left little rippling swells for a wake, it could be seen that he was on his native heath. With a deft stroke here and there, Mose guided his little craft scientifically.

Mose poses for the camera

To Moses the water was an open book and as we would set out from our camp at the foot of the southwest arm of Lake Timagami and cross one portage into Olier lake, where we were in the habit of enjoying the king of sport with Shigan—the fighting bass—he would read from the blue depths nature's story. He would point out the favorite rock-ribbed nest of Ogoishe—the rock bass; where Kenonja—the northern pike—would lie in wait before hurling himself on unsuspecting brethren of the deep; how Oganse—the pickerel—preferred to wallow in a certain swift current that tumbled into the larger waters; and holes many hundreds of feet deep in whose dark and unknown depths Namaqus—the lake trout—sulked during the day, but left in the shades of the night to roll and splash in the surface sun-beams.

The portage would be taken and if only Bert and I were along—occasionally the “Lady” would remain behind in camp and steal a few hours extra sleep—Mose would slip the canoe easily on his shoulders and balancing it with his right hand would take the axe, bait pails and perhaps an odd sweater and silently glide away over the slip of land separating us from our fishing beds.

In the still of the morning or the calm of the evening, Bert and I carrying our beloved tackle and cameras, would following slowly over the well-worn portage path that could have told us so many tales, strange and weird, if it could have only given tongue. It might have taken us back to the time of the first Ojibway brave, as he made his way to the Hudson Bay post, which in the early days was back of Timagami Island, with his bale or furs; or again to the days when painted bucks, with their squaws left safely behind in their wigwams, stole through the woods and over the waters to partake of the harvest of scalps that were reaped in the early Indian wars around Georgian Bay.

Coming to more modern periods the portage path could have spoken of the first surveyor, the lonely prospector, and the latter-day green-

horn, who insisted upon carrying his canoe by the thwarts or dumping the hot ashes of his pipe into the woods and leaving behind a raging inferno that blazed and scorched and killed until it died out from lack of fodder.

In tender tongue it might have spoken of the honeymoon couples, who hand in hand had walked over its stony path in the wake of the guide and commenced their life of love and sacrifice under a roof of stars and hemmed in with nature's walls, a criterion for them to follow through life's journey.

Once on the water and over the fishing bed of reeds, Mose became possessed of a pair of eyes that could see bass where Bert and I could only see water.

"No bass there," he would say, after a careful look into the blue depths and on the canoe would go until another reed bed was sighted.

"Good place," Mose would grunt and when he said that, Bert and I would brace our feet and begin to look anxious. It always meant fish and big, black gamey fighting bass at that.

Then the hooks would be carefully baited with live minnows, during which Mose would be dropping the anchor, which consisted of a huge rock tied to a piece of clothes-line for the purpose of keeping us over the bass bed. The canoe safely tied, Mose would also bait his hook and then the sport, which has no equal in the world, would commence.

I remember vividly on one occasion I had no sooner dropped in my hook than a three-pound black demon shot from out of the reeds, grabbed the minnow and started to walk away with it.

"You got him. You got him," shouted Mose, and as I jerked the sharp barbs into the scaly mouth, there was a zip of the line and with a flash of spray a darn shiny body broke the surface of the water, spun in the air for a few seconds and then returned to the depths, determined to fight to the last to rid himself of his tormentor.

"Keep him on until I get one,"

The father of the father of Mose

shouted Mose, and while the trick was a new one to me, I played with my catch until Mose had also got one on from the horde of fish that were following my victim, for what reason I don't know, unless it was simply curiosity or greediness to partake of what the hooked one was trying not to partake of.

Bert then threw in, and while I endeavored to land mine, he struck and succeeded in getting another beauty on. As a result, the three of us all had fish and it certainly was pleasant, but no fun trying to land them and only have the canoe to work from.

Eventually the three fish were landed, but Mose had his in, despite the fact that he was second in the water, minutes before Bert and I. The secret of Mose's success was that he scorned the use of the reel and as long as the line and hook held he simply pulled, hauled and yanked until that fish came into the boat or sailed away with the best part of his tackle.

On that occasion we caught all the law allowed and it was a memorable two hour's fishing. Mose worked the same tactics from reed bed to deep rocky holes and very seldom made a mistake on his selection of bass nests. But no matter how big or small the fish, Mose did not take to the reel.

Mose was in the habit of trailing his minnow in the water while moving from the different holes, while Bert and I scorned such fishing methods and always carefully drew in our lines and re-baited our hooks. It turned out that Mose had the right idea in attaching a trailer.

The first time a big bass broke the water and after grabbing the minnow was yanked into the boat so fast by Mose that it must have got out of breath.

"That's the way to catch them. Make them come after you," remarked Mose, amid broad grins, as he unhooked his victim.

Another time when he left his bait overboard, Mose pulled in a bass that run along the top of the water for almost ten feet in its efforts to grab the wiggling and bouncing minnow. Despite the fact that we considered it an unorthodox method of fishing, Mose was more pleased than if he had landing the biggest bass ever caught in the Timagami Forest Reserve. Accomplishing the unusual gave Mose the keenest pleasure and enjoyment.

One afternoon the "Lady" and myself were fishing in one canoe and Bert and Mose in another. For once, Mose was unable to locate the fish and wandered all around the little rock-bound Lake in an aimless manner, while the "Lady" and myself were enjoying the best of sport. We were catching them—big black fellows—and did not go out of our way to give Bert and Mose the laugh anytime they paddled by.

Finally we became separated and after catching three under the shadow of a steep bluff and being pestered to death by little rock bass, which insisted upon swallowing a bait almost as large as themselves, we rounded a corner and beheld an exhibition of bass fishing that

The Lady, but not fishing

will always be remembered as long as bass-are bass.

Bert and Mose were casting alongside of a dead tree, buried about a yard beneath the surface of the water, and as fast as they threw in, their bait was eagerly and voraciously snapped up by a huge school of bass of all sizes that had been basking under the log. For five minutes there was a confusion of shouts, splashes, ejaculations, flopping fish in the water, on the water, and in the canoe, hurrahs from Bert and grunts from Mose. When the smoke finally cleared away ten fat black bass twisted and flopped on the now scaly and bloody floor of the canoe. Bert was wearing a triumphant grim that extended from ear to ear, and Mose, his face wreathed in smiles, chuckled and said: "Some fishing."

It was the most extraordinary bit of bass fishing that had ever been my good fortune to witness and that night, while Mose and I were having our smoke before pulling up the blankets, I asked him what was the reason for the bass taking the bait so savagely, considering the fact that it was during the hottest hours of the afternoon.

"Fish mad and want to fight" was his explanation, and I guess he knew what he was talking about, because I have never witnessed such an occurrence since and as a matter of record, never had before.

As we spent day after day with Mose he continually turned over new leaves from the book of nature. One day it was a new method of baiting and the next a novel way in which to string our catch. He fitted into his surroundings without the least trouble and proved a guide among guides.

Breaking camp was not as pleasant as setting up, though a heavy rain fell, and when we pulled away from the rock-ribbed point where Mose

had erected our home of a few days, it was with sincere regret. We wrapped the "Lady" well up in a rubber coat, Bert threw on a heavy sweater and I donned the pack-sack, but Mose scorned the rain and with his pipe alight and bowl upside down in order that the drops would not put out his tobacco, sent the canoe humming through the water at such a rate that Bert and I had to exert ourselves to keep in the going.

A few hours stiff paddling against a head wind-landed our little party at Turner's. All of us were soaked through, but thoroughly convinced that Mose had lived up to his reputation of being the last word in guides.

ALBERT E. JAY

NEARLY every body of water of any magnitude has at some period of its existence, been credited with harboring beneath its calm and placid surface some species of the denizens of the deep. Even the Grand River, which flows so serenely and peacefully from its source through the beautiful agricultural districts, cities, and towns of southern Ontario, eventually pouring its large volume of fresh water into the turbid waters of Lake Erie at Port Maitland was at one time supposed to be the

abiding place of some unnamed species of the deep sea tribe. Just how the gentleman had managed to navigate the dam at Dunnville was not explained. He probably landed and skirted the dam while the night watchman at "slabtown" slept. Be that as it may, there were several reputable people who had heard from a very reliable source that Mr. So and So talked to a man who told him positively he had met a fellow, whose father knew a man, who had seen this scaly monster rise out of

the water anywhere from twenty to fifty feet, snap its jaws like a clap of thunder, survey the surface of the river for a few seconds, and disappear again beneath the water. Once a rumor gets a real running start a prairie fire, or a spread of chicken pox has nothing on it for getting around, and like an avalanche it gathers size, and momentum equally. The big fish as some referred to it was reported to be anywhere from twenty to one hundred feet in length, and from the size of a man's thigh to that of a sugar barrel. To be sure no one gave the rumor the least credence, not any at all, but certain of the boys between the ages of short trousers, and their first manipulation of Dad's razor, herded in pairs or squads, and gave the river bank a wide berth after the twilight shadows began to fall. The story had about died out for lack of fuel, and the kids were once more taking an afternoon dip, with a sentry posted, when four boys ranging in years from sixteen to twenty, planned a little fishing party to take place that night. Notwithstanding the fact that it was a violation of the game laws it was not unfrequent for the boys along the river to load up the old flat bottom boat with pitch pine, set the light-jack up in its socket in the front of the boat, push off quietly and when in the middle of the stream light up and let her go. Game laws were less stringent then, and fish more plentiful, therefore some of the first families' sons were fish bandits without their conscience clamoring a very violent protest. Arrangements were about completed when Tom, the wag of the party, wondered aloud if the sea serpent would be prowling around that night. The joke did not bring forth much hilarity, and from the man in the tree's standpoint it looked as if the wonderworks of the other three boys ran about parallel with Tom's. However, as soon as the big world was shrouded in darkness, there being no moon, the boys secured their spears, paddles, etc., and silently made their way to the boat landing. It was the work of a few moments for them to load

the wood, adjust the lightjack, and with Jim, who acted as master of ceremonies, taking his place in the front with Bert beside him, and Tom and George acting as propellers the boat was pushed out into the creek which leads out into the river proper. Without a word, and scarcely a ripple the boys paddled along until the mouth of the creek was reached. "Whoa," said Jim, and the paddling ceased. There was the flare of a lucifer, and shading it with his hat Jim applied it to the fine wood in the bottom of the jack. There was a little flame at first which was soon fanned into a bright blaze and in less than no time the wood was crackling, and a great glare of light was thrown over the water for some distance. This light has the effect of either dazzling the fish, or making them curious; in either case it is very often their undoing. "I guess we better run up to shore, and swing around inside the island first," said Jim, and the boat swung smoothly to the right, and ahead. It was scarcely under way when, zip, Jim's spear cut the water like a knife, the handle slipping smoothly through his hands. With a chug, it stopped, and a three pound pike, (up here we call them pickerel) was brought into the boat. A little further on Bert shifted his body slightly, and his spear shot out, nearly to the edge of the circle of light, and was retrieved empty. A large fish went tearing through the shallow water making a sousing noise every time his rudder went wrong and brought him too near the surface.

"Wha's th' matter, loosin your eyesight," asked Tom sarcastically.

"No he was afraid of hurtin' his feelins' or breaking the hide," chimed in George. "He's waitin for 'em to jump in the boat."

Bert said nothing. These boys were real experts with the spear and paddle and while they got very little praise or encouragement no matter how many fancy shots they might make they got plenty of roasting no matter what kind of a difficult shot they happened to miss. They were there to get fish and results were expected of

them, not excuses. They had been out nearly an hour and the bottom of the boat was rapidly covered with various sizes and nationalities of fish. The party had arrived at the eastern end of the Island, and Jim opined it would be a grand night to run up the other side of the Island, and down the long mud bar. This trip would require the replenishing of the wood supply from a pile on the creek shore. The boat was headed across the stretch of intervening water. The spearers assisting, the craft was soon pushed through the weeds and soft mud to the shore. Stepping ashore Jim hooked the spear over the edge of the bow platform, and hauled the boat up far enough to enable them to load the wood. Bert then climbed out and gathering up an armful of wood was about to retrace his steps with his burden. Suddenly he stopped short his eyes popping out and his jaw sagging.

"My Gawd, look there," he roared, and flinging down the wood bolted up the hill, and was lost in the darkness. Jim was just getting to his feet with his load when he caught sight of what had alarmed Bert and scattering wood all over the shore followed Bert up the bank and into the gloaming. At Bert's yell of alarm, Tom gave one fleeting glance over his shoulder and yelled "Holy Jumpin' Jackrabbits! It's the snake," and cleared the woodpile in the first bound. His intentions were to clear the boat at the next. He did, but not exactly as expected. When alighting from his starting leap, his foot lit squarely on a big mullet. "Gawkl!" went the fish. Tom's feet went up in the air. He pirouetted like a whirling dervish and landed kerplunk in the soft ooze at the boatside. He landed on all fours, and probably thinking this would be an admirable position for the charging reptile, gathered himself up like a measuring worm - and with a mighty heave extricated himself from the mire. He tarried not, but with a clatter of cowhides disappeared in the general direction taken by the other two. Poor George! He had not seen the

cause of the disturbance at the first look backward, but at Tom's departure he took a second look and saw coming straight for him two gleaming orbits that looked as large as the headlights on a twelve cylinder Cadillac to his terror-stricken eyes. There was a sort of whistling noise coming from the direction of two balls of living fire. George who was an agile youngster, let out a war-whoop that would have struck terror to the heart of a dog ribbed Indian, or a Moro headhunter. He touched the top of the woodpile with one foot, the deck of the boat with the other, and the next spring landed him on terra firma. "Wait for me boys," he called, and proceeded to clip several seconds from Mel Shepherd's best record. On came the monster, George could hear it leaving the water on his trail, and his cowhide boots frisked the oat stubble until the sparks flew like stroking a cat the wrong way in the dark. "Jim," he roared, but received no answer. Stepping on the human accelerator of his system he tore along with his pursuer gaining rapidly, and almost upon him. On it came. Was this moment to be his last! Would he be swallowed whole, and never found? He thought of all the mean tricks he had ever played on his little sister, and the number of times he had disobeyed his mother, of the times he had shirked school and gone fishing, and other horrible crimes.

All these thoughts passed through his terror-stricken mind like Charlie Chaplin's best thriller. On came the reptile, skimming ever the ground with wonderful rapidity. It was now upon the heels of the fleeing boy. Why did it not seize him? Now it was at his side. He could hear its deep breathing as it ran. He felt the hot froth from its jaws on his hands. But listen. What caused the pattering of feet when it ran? Surely those feet were not attached to the body of a serpent. And that skunklike odor, was not the aroma of a reptile. "Bow-wow," went the snake, and at this terrifying moment George recognized his pursuer as Bert's old crossbred shepherd dog,

who made it his business to patrol the shore when the boys were fishing. Becoming lonesome, he had swam the creek when the boys put in for wood, and was coming to pay his respects and perhaps inform the boys that he had enjoyed a little mix-up with a skunk. Had Old Bounce's carcass stopped George's No. 8 brogan, his skunk-hunting career would have terminated then and there.

But he ducked nimbly to one side, and George nearly dislocated his hip joint retrieving his foot. The other boys came sneaking back, and Bounce's ancestry was slightly referred to, and his popularity was at low tide for the remainder of the night. There was no more fishing that night, and the Sea Serpent was never seen again.

EDWARD T. MARTIN

THE ruling has gone forth and the treaties been signed between Canada and the United States protecting migratory game, and its sale has been forbidden, which is good if the law be enforced and bad if only the well disposed who wouldn't sell game under any conditions are affected and the pot hunters and market shooters go on as before only using a little more care as to customers and places of marketing their wares.

The law should go further than it does. It should cover certain upland birds, prairie chickens for example, as well as water fowl, and bay and marsh birds.

Pinnated grouse unquestionably migrate. I myself have seen them going south across the Canadian line. And I have known of others,

presumably birds from Canada, keeping on through Dakota, Minnesota, and Iowa in great droves until they reached southwestern Missouri, Arkansas and other states where winter food is abundant and winter snow largely noticeable by its absence.

This migration has been commented on by many experienced hunters of upland game but was much more talked of forty years ago than now when the chickens are rarely seen going south or anywhere else.

Said Colonel Bob Crockett, a nephew of old Davy, to me one November day when in the White River country of Arkansas we were watching thousands of prairie chickens work in ahead of a coming northerly storm, "These chickens are not local birds, those raised here that passed the summer with us. They are from

the stubbles of the grain raising states and it would not surprise me if some were visitors from as far away as Canada."

Said an old time Minnesota gunner on another November day as from the summit of a little rise of ground we watched great droves of grouse flying from the north, straight south, never slackening their speed, making no attempt to light, "Our summer birds have gone. The ones we are watching are mostly "sharp-tails" from Canada. Some will keep on and some will stay in the neighborhood. Later in the day they will begin to light. I have seen them do this for many years."

It was not necessary to tell me this. I already knew, for on at least one other occasion I had seen a migration from a point near the boundary, of pinnated and sharp-tailed grouse from Canada to the States and if any returned, I feel certain it was not that year but the next.

If any birds need protection it is these same grouse. So why not help them a little more by classing them where they really belong—as migrators, although there are so few now that the migration is of tens and twenties instead of in thousands.

If the non-sale of game is to be enforced, why not include in it the renting of fresh water ponds and marshes that by baiting are made into shooting preserves for the gun clubs? When a land owner rents his duck pond for several times more than the same area of good land close by is worth to crop, what is he doing but selling his ducks at wholesale to the gun club men? What is it but rank commercialism? And if game is to be conserved, commercialism must first be driven out, there being no difference so far as I can see, whether it is a land owner selling by wholesale on the wing, or the market gunner trying to sneak one over on the law except that the first should be judged as the more guilty and fined the heavier.

If the love of money is the root of all evil with man, the desire for a

craw full of good grain is the same with all game.

Waterfowl in spite of constant shooting will hang around a baited pond for the love of the wheat, the barley or the corn that has been placed to lure them there when the common sense with which all are endowed tells them, "danger! danger!" Notwithstanding they take chances and stay.

The mere use of the bait whether it is grain, cull beans or tomato pulp, cuts not nearly the figure as does the desire to kill and keep killing and the mercenary feeling the renting the ponds engenders.

Said a club member to me at the close of the past season, "We shooters have paid old Blank something like two dollars apiece for every duck taken off his two ponds this year. He was paid eleven hundred dollars for the use of those, less than ten acres, while better land near the highway and not 300 yards distant from the ponds, he considers well rented at thirty dollars the acre. He does not need the money, and he had a fifteen year old boy pinched because he sneaked through a hole in the fence, killed two teal on one of the ponds and sold them for a half a dollar. I wonder what he has been doing but selling us ducks all the fall and wish there was some way we could get back at him."

So do I.

There are few people living who have seen game at high water mark and know from their own observation exactly what that mark was, and I am one of the number.

Taking the published records of the top notch market shooter as a guide, there seems to have been but a trifle more game in the late fifties and through the sixties than there was twenty years later. Prairie chickens, I am quite sure, held their own up almost until 1880. They might be termed birds of civilization following the plow, the breaking of the prairies and the planting of grain, doing better on their gleanings of the stubbles than on the insects of the prairies. All they seemed to ask was a reasonable amount of

food and plenty of cover in which to hide and build their nests.

I am told that while in 1850 there were but few grouse in the far North-western states, then territories, and almost none across the line in Canada, in the more thickly settled western and near western states they were very abundant and pioneers in Minnesota, the Dakotas and Canada have often said to me, "We got here before the chickens."

They grew less in Kentucky, Ohio and Illinois. They were never plentiful along the Atlantic seaboard and as they became less in certain locations, they increased in others when hitherto untilled lands were cultivated and bore golden crops of grain, there being fully as many chickens, so I judge, in existence in 1880 as there were in 1850, something like fifty or sixty a day being the average kill of a skilled market hunter in the fifties, while I know of one shooter who in 1880 averaged close to sixty, and another a year later, a farmer too and not a professional, who did nearly as well. This, mind you, for the season and not for isolated days.

It was like pulling a blanket from over one's feet to keep his head warm—the same amount of blanket only in a different position, or at least such is my idea.

All of the grouse family are prolific layers and but for the attack on them being a combined effort by the gun, the mowing machine and reaper as well as the plow, there is no reason why the blanket has shrunk until now the entire body is bare, nor why, under improved conditions, there cannot be a come back.

It is a good thing that a considerable part of the prairie chickens yet in existence are in Canada where game laws are enforced and they receive all the protection that is coming to them, but my! how much better if the powers that would be—class them with rail, with plover, with shore birds and say, "Yes, these also are migratory. They need increased protection and are going to have it.

Don't point your guns in their direction."

Captain Bogardus, king of market shooters in his time, dates his activities ten years further back than my records go. He was at least consistent in what he did and said. He insisted, "No amount of fair shooting makes much difference to game in a good game country" but he urged, "leave them spots of slough grass to nest in and there will be no decrease." I wonder what he would think to come back to earth at the present time, to see things as they are, to hunt as I have hunted this past December, to spend parts of three days in what was a good game country only as far back as 1910, to kill every bird within range for a total bag of one pintail, one snipe and eight "blue mallards." (mud hens.) Still it must be remembered that in the Captain's time there were no autos to multiply the distance where a hunter could go after game, nor automatic pump guns and smokeless powder to aid in its killing.

There is little doubt that market shooter though he was, the Captain would agree the time had come to put on the brakes, to stop the renting of ponds at prices which mean the selling of water-fowl at wholesale, to fine the pond owner as well as the boy who sneaks through the fence. Also to make the fine fit the crime, to put into the migratory class everything that may belong there and if there is a doubt, let the other fellow prove it.

Let us be honest with ourselves and with the game. If "dwarf domestic duck, baked prairie owl, or broiled snowbirds" appear on the menu of any exclusive club or restaurant, investigate and find what it really is, then if every sportsman does his part, it will be easier to obtain the proper enforcement of game laws by others but until all sportsmen show a proper spirit in game conservation and are willing to do their share instead of wishing it onto someone else, well I am sorry for the game.

It Often Happens

HARRY M. MOORE

HE was the King of Buck Mountain!

His four-pronged antlers surmounted a proud, defiant head; a head that set off the thickness and roundness of his sleek neck. (Old Bill saw him once. Old Bill.....).

He was the King of Buck Mountain.

He was the King Buck of the hills, with the speed of the wind, the cunning of the fox, and the courage in battle, of the lion.

Three, four, maybe five years before he tried to steady himself on his wobbly legs while viewing Mother Earth for the first time. That was in the Big Park. There in that eighty-five mile square breeding grounds, he grew to maturity and to wander. One day he wandered outside the limits defined by The Law. And—he never went back.

By day he slept in one of the soft beds in the big swamp back of the river. By night he climbed the slopes of the hills for the tender shoots of the sumach, or to bury his antlers into the sides of any young buck that dared come between him and his does.

He was the King of Buck Mountain. Ah, the king has not the gift of prophesy. He has not the power to say how long he shall reign.

Occasionally he crossed the hills, descended the steppes, and drank from the rapidly running river. Or he would stand in the water and study his moon-made reflection. He was a big deer then—a super-buck in a super-land. Once he came to the river, and—

Unannounced The Kid breezed in on the "mixed" at noon and leaned his old .38-55 against the tent. He poked his face into the door.

Big Brother, just back from France, where he had been killing Huns for The Big Brotherhood of Man, jerked the pan of sizzling bacon from the hot coals, and swore.

"What the h.....l brings you here?"

Big Brother's brow wrinkled with undisguised disgust. Old Bill sat on the bed, setting the table. The

hunting season had been a rotten failure. Neither Big Brother nor Old Bill had carried home a liver. And now—

"Guess I've as much right here as you," The Kid pouted.

"You never saw a live deer in your life," Big Brother stormed. "You'll get buck fever——"

"You got it, too, the first time you were out." The Kid drove home the thrust.

"Let The Kid stay," butted in Old Bill, wiping a knife. "He might change our luck!"

"Luck, h.....l!" yelled Big Brother, turning the bacon. "Why, he's as deaf as a mute." He jerked around to The Kid. "You may stay, but—you'll never go into the bush with me."

Old Bill grabbed the loaf of bread and sawed off a slice as thick as a plank.

"I'll fix it, Kid," he announced kindly. "You'll do as I say tomorrow morning, and we shall see what we shall see."

In early morning The Kid sat on a log beside the rapids. Old Bill and Big Brother had crossed The Dam and were somewhere up over the hills. Old Bill had told The Kid that if he let a deer cross the rapids——

The Kid raised his eyes. Something had moved in the saplings across the water. There had been no sound, the noisy rapids would account for that. The Kid brought his rifle up tremblingly and slowly. And then—

Just then a four-pronged buck stepped out of the saplings and stared across the rapids. For a moment the deer studied the other bank, and then—

He straightened up suddenly and turned tail.

The Kid sprang to his feet and played the lead on the white flag, the while his heart beat in his throat.

The deer leaped over the first ridge and disappeared. Cursing his luck, The Kid jumped into the icy waters

and plunged across. He scrambled up the slope.

Rotten!

He had missed his first deer. And Old Bill had told him if he let a deer cross the rapids—

The Kid raised himself on his toes. On the other side of a log, a few feet distant, a patch of grey appeared.

Along about noon, Big Brother and Old Bill, silent-tongued, crossed The Dam. At the rapids they stopped to enquire for The Kid. He wasn't there. But—

Across on the hill, dragging a deer by the hindquarters, apparently unaware that the animal's horns were catching on log and stump and tree was The Kid who had never seen a live deer before.

"And he would have split that old

four-prong down the back, if I hadn't stopped him," commented Old Bill afterwards. "And just fancy, two old hunters like us to be outdone by a pup of a kid who never hunted before. Well, don't it beat all?"

And that night, beneath the myriad starred November sky a daring young buck picked his steps up the slopes of Buck Mountain and challenged The King for combat. But The King—

The King hung on a white birch down by the river.

And the daring young buck, having challenged and not being taken up, became The King by right of his boldness. And the does without any further recommendation accepted him. For lo, the King is dead; long live the King!

Some Fireside Yarns

E. DALTON TIPPING

I HAD just returned to the City after spending six weeks up north, and as timber cruising in winter is by no means an enjoyable occupation, was more than pleased to get back.

After supper I struck a bee line for the club knowing that I would find my chums there. On reaching the door, it being partly open, I glanced in. Ed. who had recently returned from a big game hunt, held the floor, armed with a billard-que representing his Winchester automatic, he was showing the bunch how he brought down his moose. This being his first moose he was naturally proud of his achievement.

They met me with the same old greetings, "Hello frontiersman, how long since you left the blazed trails? etc." After learning the latest news of the outside world, I was called upon to give an account of my trip, which took me as far as the Pelician Mountain, situated sixty miles north of Athabaska Landing.

On October the eighth I left Edmonton with Pete (my guide) and

packtrain, four in number, including our two saddle horses.

It took us four days to make the Landing, where we forded the Athabaska, it being very low.

We then followed the river, going down stream for fifteen miles where our trail turned due north to Calling Lake about twenty miles from the Athabaska.

I asked my guide if we had left all humanity behind, as we had been travelling a whole day and had not seen a soul.

He told me that we would reach Old Yukon Dan's cabin that night, which is located at the south end of Calling Lake. Dan spends the winter months trapping while the summer is devoted to prospecting.

Just before sundown we got the first glimpse of Calling Lake, where the trail followed along a high ridge, in the distance we could hear the cry of the loon and occasionally would see a flock of ducks testing their wings preparatory to their long southern flight.

We travelled for some distance in silence save for the incessant cries of the waterfowl, when suddenly there came to my ears the clear ringing blows of an axe.

I glanced at my guide who just nodded and said, "Dan cutting his night's wood."

On rounding a bend we came in sight of the cabin and on seeing us Dan dropped his axe and came to meet us.

He gave me such a hearty welcome and hand shake that all formality seemed to vanish.

Leaving my guide to attend to the horses, Dan took me to the cabin, where I met his young partner Ed, who with his sleeves rolled up was busy preparing their evening meal. The cabin was built of hewn logs, the floor of poles hewed flat on the upper surface, at one end was a massive stone fireplace, above which hung a fine pair of moose antlers and across these lay two rifles.

The walls were decorated with the skins of birds and animals including two large bear skins, a cinnamon and a black. All this I took in at a glance while Dan was helping me off with my coat; he then pulled up a homemade chair covered with a wolf skin before the fireplace and told me to make myself comfortable while he helped Ed. prepare supper. By the time supper was announced Pete had got the horses picketed, and told me under his breath he was near starved, which (after the meal) I was perfectly willing to vouch for, and with perfect modesty can say I did justice to it myself. Roast ducks were most acceptable after several meals of bacon and beans.

After supper we got comfortably seated around the glowing fireplace, enjoying our pipes.

I drew Pete's attention to the two fine bear skins, at which Dan got up and brought down the big cinnamon, I then noticed that the head was hacked and cut in long gashes presumably by a knife, after I had examined these, Dan sat down and told his story.

"I had quite a time getting the best of that fellow. Had broken the

stock of my rifle, and Ed was out for supplies taking his with him, so my only weapon was the old Hudson's Bay muzzle loader you see standing in the corner there.

"Well I started out one morning early last winter just after a fresh fall of snow to get a little venison.

Had got down to the north end of the lake when I came upon a fresh bear track, of course I took after him, he followed along the lake shore for a short distance and then hit up into the hills. I figured he might go to his den so I went mighty easy. Well I guessed right, for on working around a windfall I came to his den and there were the fresh tracks going right in, he had a hole dug at the foot of an upturned root about three feet across.

"As my old muzzle loader was only good for one shot at a time I hitched my big knife around on my belt where it was handy." (At this stage of the story Dan got up and took down a big knife in a heavy leather sheath that was hanging on the wall,) "This is my pet," he said, as he drew it out and handed it to me, the blade was about twelve inches long, three inches wide and as heavy as a small belt axe.

As Dan replaced the knife in its sheath he continued, "The bear had dug himself in a good six feet, and had there made his nest, I picked up a chunk of rotten wood and tossed it into the den, and then with my gun ready cocked, I stood a couple paces from the entrance; presently I saw the old fellow's nose through the semi-darkness and then made out the outline of his head; I took aim and fired and at the same moment grabbed my knife in case my shot had not proved fatal; he went to rush out but using a trick I had learned from an old Cree Indian I slashed him across the nose which caused him to instantly draw back. I tried to reload my gun and had got the powder in when again he made the rush, I gave him another slash which had the desired effect. My next move was to reach into my pocket for a lead bullet, moisten it in my mouth and drop down the barrel onto the powder.

"At this moment I noticed a short log laying to one side, I rolled it against the mouth of the den just as the bear made the third attempt. He was bent on getting out and I slashed with all my might till he again backed in, I think if it had not been for the log I had rolled into the opening, he would have gotten the best of me. My final task was the hardest of all, namely, to get the cap on the nipple, as my fingers were getting stiff with the cold. However after dropping several in the snow, I managed it, and then waited for the final rush which was to either be the end of Mr. Bear, or myself, as by this time, naturally his anger was properly aroused.

"I stood waiting, but not for long, when out he came; the log obstruction I had placed at the mouth of the den impeded his progress long enough for me to take good aim; I fired, and down went the bear, so that is the story of the big cinnamon."

I looked at Dan as he gazed into the glowing fire, his face tanned and wrinkled by sixty odd summers of strenuous frontier life; presently I asked, "Didn't you realize what chances you were running?" He just smiled and said. "We who follow this life don't think of that, to us it's a big game of bluff, if you can't play your bluff why you just lose.

"While our conversation is dealing with bear, I'll relate a little experience I had which will show you how far one can carry a bluff with a bear.

"I was prospecting up on the Liard with a partner in the summer of '94. We had an old flat bottom boat that we were lining up the river with our outfit.

"One evening while my partner was getting supper ready I took the old Winchester that we kept for shooting partridge and walked over to a small poplar and spruce grove in search of some birds.

"I was working quietly through the bush when presently I spied what looked to be a porcupine in one of the trees; on drawing nearer I discovered it to be a little cub bear and on the ground at the foot of the tree was another. On seeing me they made a

frightened noise, which brought the old bear on the bound full of fear for her offspring. At the instant she spotted me I was endeavoring to throw a shell into the breech of my rifle, but the blamed thing had got wet somehow and had rusted, making it useless. She hesitated a moment and then charged right for me. I thought and thought quickly; to turn and run would have been foolhardy, to climb a tree would be just as useless, as they were all small, even if I had time. I remembered reading of animal trainers cowering wild animals by the steady gaze of the eye; it was a scanty bluff but I tried it.

"She came within ten feet of me and reared on her hind legs, her ears flat and her eyes blazing like fire, her paws held in midair ready to lay me out, her jaws snapping showing her big white teeth.

"There we stood each holding our ground, if she had only known how scared I was, the game would have been all up with me.

"I can't say how long we stood that way, but presently the cubs started their frightened whining again, at this the old bear turned and ran back to them.

"I took this opportunity and backed away about twenty feet, when she glanced back I stopped. On finding that the cubs were not being molested from that quarter, she again turned upon me. This time she stopped twenty feet from me, and did not raise up, but kept snapping her jaws.

"I held my gaze steadily upon her, I could see my bluff was working as she seemed unable to stand my steady stare. She would watch me for a minute and then let her eyes shift for a second, only to blaze back at me.

"She couldn't quite make up her mind to attack, and yet was loath to let me get away. Presently she thought of her cubs and back she went to the tree, by this time my legs got the best of my nerves, I dropped the old Winchester and headed for camp, and the way I covered that stretch of ground was marvellous. My partner wanted to go right back with our good rifles and land her, but

I said 'No,' I felt I at least owed her her life for sparing me mine, but I maintain to this day it was my bluff that did it."

Next morning again found us in the saddles on the last lapse of our journey. While riding along in silence I thought of Dan's bear stories, and wondered what I would do under similar circumstances, and sincerely hoped that I would never have occasion to play, what Dan called, "His game of bluff." But a trip up in that country would not be complete without a thrill of some kind, but mine was of a nature entirely different to Dan's.

I was coming back to camp one evening, keeping clear of the standing dead timber as there was a regular hurricane blowing and trees falling in every direction. Presently I heard an unearthly bellow and squeal, then a terrific crashing just to one side of me, the brush being

very thick prevented me from seeing what it was. I stood perfectly still with creepy chills running up my spine into the very roots of my hair. Then presently out there came, not forty yards from me, two big bull moose, and then I witnessed a fight I'll never forget. With hair all on end and heads lowered they would charge, their huge horns coming together with a clatter, then they would turn and separate only to come together again. As my only weapon was a 38 cal. revolver, I felt far from comfortable, and was greatly relieved to see the vanquisher in rapid pursuit of the vanquished disappearing in the opposite direction to the one I wished to take.

Then Ed let out a hoop, "I've got it, next fall we'll get up a party and go up there for a big game hunt. I'll bet one of those fellows is a fifteen pointer, with a sixty inch spread." This suggestion was followed by hearty approval from all.

Various Species of Deer

"Reader," Saskatchewan, asks for a description of the different species of deer, including the mule, the black and the white-tailed. The following are quotations from an article entitled "The Larger North American Mammals" by E. W. Nelson in a former issue of the Geographic Magazine.

Mule Deer.

Mule deer are larger than the common white-tails, with a heavier, stockier form. Their strongest characteristics lie in the large doubly branching antlers, large broad ears, and rounded whitish tail with a brushlike black tip. Their antlers vary much in size but in some examples are almost intermediate between those of the white-tail and the elk. Antlers of the mule deer and of the black tail agree in having the tines all pronged, in contrast with the single spikes of the white-tails. In summer these deer have a rich rusty red coat which is exchanged in winter for one of grayish brown.

Black Tailed Deer.

In general appearance the black-tails have a close resemblance to the mule deer. They have the same large ears, forked tines to the antlers and rather "stocky" body; but the brushy all-black tail distinguishes them from any other American deer. In color they have

much the same shade of brown as the Virginia deer. They have the usual cycle of annual changes common to most American deer—assuming a dull coat in fall and losing their horns in winter, followed by the resumption of a brighter coat in spring and the renewal of their horns in summer.

Virginia or White-Tailed Deer

The aptness of the name "white-tail" for the Virginia deer is obvious to any one who has startled one in the forest and seen it dash away with the tail upright and flashing vivid white signals at every leap. The adults have two strongly contrasted coats each year: brownish gray in winter and rusty red in summer. The fawns, usually two in number, are dull rusty brown, marked with a series of large white spots which remain until the gray winter coat is assumed in the fall. Large bucks sometimes attain a weight of more than 300 pounds.

He also asks what kind are found in Saskatchewan. The species of deer found in Saskatchewan are as follows: caribou, elk, deer and moose. At the last session of the Legislature the elk was removed from the list of big game animals that may be hunted in that province.

Coyoteo and Coy

A Tale of the Prairie Foothills

H. MORTIMER BATTEN

I.

THE Love Moon was long since past. Coyoteo and Coy had reared their cubs in the rocky fastness overlooking the Silvertrail River, and now had sent them out into the world, wise in the wisdom of the trails. But with the coming of the first frosts a new restlessness fell upon the jackals of the Silvertrail, a vague desire to wander southwards with the sun to quite a distant range, for at this season their ancestors had wandered southwards at the heels of the great buffalo herds.

Only in one way did these vague promptings have a definite effect upon the resident jackals of the Silvertrail. High on the skyline, at the crown of some grassless butte, Coyoteo and Coy would sit together under the Harvest Moon, pointing their noses to the sky, and howling their lone, sad wander lust. Other jackals would hear and trot to the skyline, over-

looking the wide valley flats, to answer echo for echo, till their thin wavering calls spread north and south, over every range for a score of leagues, dying and fading till lonely ranchers covered their ears and shuddered. Sometimes the song would set the dogs barking at a neighboring farm, whereupon the nearest jackals would change their tune to a sharp "yap-yap" of mockery and defiance, for between the jackals and the farm dogs there existed a deadly feud.

There was, for instance, that blundering old fool of Bethman's down at Prairie End Ranch, part collie, part mastiff, with quite a smattering of bloodhound. Bethman spoke of the dog as "the best prairie wolf and fox hound along the range," but little he knew of the night side of Monarch's affairs.

Monarch was left loose at night to keep the prowling wolves and coyotes from the homestead yard, and

each quavering echo of the jackals' Harvest song called his bellowing roars in fierce response. Coyoteo and Coy would listen with shining eyes, then "yap-yap" in answer till the big hound roared and pranced in rage.

Then one night the two coyotes descended from the buttes, yapping as they came—down across the Silvertrail by Bethman's log bridge, to the very verge of the homestead. Here on the skyline Coyoteo sat and yapped; and the big hound, seeing him, bounded forth in fierce pursuit, to be led across the prairie ridges in a panting tally-ho, down to the Silvertrail again following each twist and turn of the line of scent. Occasionally he lost it, whereupon Coyoteo would appear on a neighboring ridge to yap and lead him on.

Six miles from home the little coyote chased his tail a round or two, then got rid of the dog by paddling down the shallow margin of the Silvertrail.

In the meantime Coy had fully explored Bethman's ranch buildings—had dined sumptuously on Monarch's untouched bowl of biscuits, and having emptied it, had filled the bowl with sand. This done she departed, carrying in her jaws a slab of-fat bacon Bethman had kept in an outhouse for restoring leather goods.

II.

Never before, since the departure of the buffalo, had the Silvertrail known so many wolves and coyotes. The wolves were the direct offspring of the ancient buffalo-runner strain, big husky cattle-killers, schooled in the knowledge of the steel trap and the poisoned bait, and on the head of every wolf and jackal there rested a liberal bounty. Yet there was no professional wolver in the Silvertrail, so this year the local ranchers put their heads together, deciding to supplement the Government bounty by ten dollars per wolf and five dollars per coyote. Thus Wolver Wells appeared upon the scene, gaunt, restless and sun-tanned—took up his abode in the deserted survey shanty north of Bethman's and prepared to settle for the winter. With him he

brought only two ponies, piled high with steel traps and baggage. This man was a veritable wolf himself. He could run from dawn to sunset at a swinging lope, carrying forty pounds in traps, pelts and his rifle—sleeping happily where the night found him, and off again at dawn to follow the circuit of the huge range he habitually covered.

Coyoteo and Coy marked his coming, knew, in that mysterious way the wild folk have of knowing such things, that he was a creature to be watched, and watched him—peering now over a ridge to mark his coming and his going till soon they knew his runways and his habits every bit as well as the wolver knew theirs.

One day Wells made a trip to Prairie End Ranch, returning at dusk with a cart load of manure, which he led across the open plateau to a bare place in the sage bush. Here he emptied his load, forming a lofty mound, and at the top of that mound he placed four steel traps, each exerting a spring pressure of 200 lbs. He knew the weakness of wolves and jackals for ascending such mounds to howl and view the landscape, especially when the hillock be of some material of distinguished scent, and feeling well content, for he had never known the trick to fail, he turned home with the dusk.

But Coyoteo and Coy had watched him through the golden haze, and when the sun sank behind the buttes in a sea of crimson they came nearer to investigate. This human creature with his mysterious way kindled their curiosity, and their very suspicions as to his good will bade them keep close count of his movements. The faint breeze which fans the prairie at dusk and dawn was in their favour, and sniffing here from the scent of a ridge, padding nearer, circling, sniffing, they approached the unaccustomed mound.

No warning scent as yet reached them, and Coyoteo became bolder, trotting out into the open, glancing around at Coy to back him up. He trotted to the hillock, circled again, then prepared to mount it.

Beware, little Coyoteo! This is an hour of deadly peril so beware! The man knows your curious ways, how you must watch and pry and investigate in your striving for a better understanding, and sooner or later he will profit thereby—beware!

Scarcely had he set his feet to mount when Coyoteo shrank back, bristling from head to tail, and muttering a warning “girr-r” to Coy. He began to scratch in the sand with all fours, growling deeply in his throat, for there on the mound he had found the scent of steel!

Now that the jackals knew where the traps were their suspicions of the place vanished, and becoming bold and boastful Coyoteo deliberately sprung two of the traps by scratching earth on to the springplates, while the other two he sprung by rolling on them. Then in the glory of the harvest moon he and Coy scattered the dunghill far and wide, and left the Wolver’s instruments of war marked with the signs of their contempt and mockery.

No longer was there any shadow of doubt left in the minds of the coyotes as to the man’s intentions here. He was there to hunt them—their deadliest foe in all the range, his wits to theirs, their cunning for their lives. Hitherto they had moved in unrestrained freedom about the range, hunting in daylight, viewing the broad panoramas of the Silvertrail from the skyline ridges but now all that was changed. Never did Wolver Wells see the strings of coyotes on the hilltops, as he had been told he would see them, though sometimes when he crossed a ridge, he found freshly made tracks leading up the other side and down again, and he knew that, a minute ago, a coyote had watched him approach from this very spot—as it was watching him now from the ridge over yonder! Sometimes he caught a fleeting glimpse of two pointed ears peering above some near by buttress, but always, if he turned his eyes that way, the points would vanish and he would see no more.

Coyoteo and Coy became creatures of the shadows, keeping always to the

hollows and crossing the skyline only where the sage grew dense. Other mysterious habits they developed, such as making long trips to a neighboring spring where a strong and sickly species of cactus grew. Here they would roll and wallow in the sickly scent, till their coats became impregnated with it, killing the scent of coyote till no dog would have followed their trails with any degree of certainty. Similarly they rolled in filthy carrion till their body scent was overwhelmed, and though they had no knowledge as to why they did these things it was all part of their campaign of self defence against the human hunter. Not that they feared him—O no!—for each night when Wells was at home they yapped derision from a near-by ridge, mocking the man and his cabin and above all the streak of foreign white smoke that rose straight upwards from his chimney pipe.

One morning Bethman and the trapper met on the range. “You want to keep that dog of yours chained at night time, Mr. Bethman,” said Wells. “I ain’t using poisoned baits, but I’ve got a heap of steel traps down, and if he falls foul of a bunch—”

“My dog never leaves the property,” replied Bethman shortly, turning on his heel.

“That so.” drawled Wells. “Then I’m mistaken, I fancied I saw his tracks eight miles up the creek, and it seemed to me the coyotes was calling him out every night to make fun of him. But perhaps you know!”

Bethman turned angrily in his saddle. “That dog knows what he’s about,” he said. “There ain’t no coyote along this range will fool him, so you get around with your trapping and leave the dog to me.”

In the glaring heat of that afternoon Wells set out to lay a long scent trail across the wind away up the foothills plateau, and Coyoteo, peering over the ridge, saw a sight which stirred his curiosity as never before. It consisted of a horseman, riding a small pony whose hoofs were smeared with wolf muck to kill all suspicious scent, and behind the pony drawn by

a long rope, there followed a grotesque, sprawling something that bumped across the hollows in ever-changing postures. Coyoteo stared and stared, and then he went for Coy to come and look and together they watched and sniffed and wondered. Down wind there came a potent and seductive whiff—a whiff of dead calf in just that stage of advance every dog, whether wild or tame, delights in.

Far across the wolf infested region Wells laid his scent trail, so that any prowling wolf or coyote, hunting up wind, would inevitably strike the line, then on a high point he left the carcass, placing around it a wide and scattered line of traps. Each trap was steeped in fat or smeared with musk, and Wells himself wore gloves so impregnated with savory scents that they left no tell-tale sign. Finally, walking backwards, he brushed out his tracks around the bait with the tail of a freshly killed wolf, and rode home by a different route.

No jackal could have resisted following that scent trail, and when the twinkling stars came out Coyoteo took it boldly at a run, while Coy ranged wide, watching him from the shadows. Up to the naked ridge it led them, and there, full in the open, diffusing its enticing invitation on the night wind as it lay with legs aspiring stiffly skywards, was the calf!

The jackals hung back, circling, sniffing, crossing and criss-crossing on the windward side, but slowly drawing in. Each foot of land they quartered with their nostrils, but there was no scent of steel. Coyoteo bellied down and began to creep, eyes shining, licking his chops. Something whispered "Keep way! Keep away!" But a stronger voice urged—"Come on! Come on! It is all for you!"

Then across the plateau, following the very trail they themselves had followed, there came the sound of heavy breathing, of clumsy footsteps in the sand and pebbles. A figure showed on the skyline and disappeared—a heavy body crashed through the sage bush, bounding fearlessly towards them. No wolf this, for a wolf comes like a coyote,

zig-zagging up wind, or if there is no wind he comes in ever-narrowing circles.

The coyotes slunk away, then full into the starlight there plunged, red-eyed, saliva dripping from his massive jaws — Bethman's hound. He roared at the coyotes and plunged on, eager to claim undivided possession of the feast, when—ping! The steel jaws of a trap closed upon his foreleg, throwing him heavily. With a roar of rage and pain he turned, his yellow fangs slashing at the trap, when—ping! A vice-like grip closed upon one of his hind legs, pinning him down in a helpless attitude, and there sounded the whine of a dog in fear and despair.

"Yap-yap! Yap-yap-yap!" Coyoteo and Coy came out from the sage bush, wagging their tails and parading round in a wide circle. The hound bounded in their direction, but now there was a new note in his bellowing roars. The jackals pointed their muzzles to the stars and yapped, but slowly the yaps became longer, less sharp, till they merged into the long ringing cadences of the rally call.

But across the eerie quietude there came another sound, a deep, base, "boo-ooo," palpitating and fierce, but tailing off into a murmur. If filled the hills with multitudinous voices, swelling upwards to the buttes, echoing and re-echoing across the valley indescribably sinister and sad. The hound grovelled down with a shudder of fear, Coyoteo and Coy, with a final mocking "yap," slunk into the sage, then full into the starlight across the plateau there surged a crowd of timber wolves!

It was a large pack for the time of the year, five in number, and they too broke up, circled and zig-zagged, scratching with all fours and peering with cold yellow eyes at the grovelling, trembling hound. Like ghosts of death they came and went—dim grey figures and glowing points of light, but rapidly the circle narrowed, narrowed, then closed in. For a moment there was a bristling, devilish heap, a confusion of ghastly sounds, then silence fell once more, to be broken suddenly by the "yap-

yap" of a coyote at the crown of a distant ridge.

When Wells came up with the first grey glimmering of dawn he found two wolves fast in his sets. Two other traps had been sprung, but the only indication as to what had sprung them were a few scattered remnants of what had once evidently been a dog.

III.

The great silence of the Snow moon came, bringing its biting frosts and its dead clear, hungry nights. Vague and vast lay the plateaux of the Silvertrail under their first fall of snow, tinted each dawn and sunrise with colours beautiful beyond belief. But the awful loneliness of the place was crushing in its magnitude. There was no sound, save the short, sharp croak of the ravens. The laughing Silvertrail was frozen from bank to bank, from surface to bed, and likewise the thousand laughing creeks that fed it. The very buttes were festooned and pillared with ice, flashing in prism colors, and it seemed to Wells that he was the one lone, living thing amidst the abandonment.

Yet there *was* life, and when Wells came to take the census of the range he saw that a rich harvest was yet in store for him. His hunting now took on a different form, he became even more alert and watchful, and always, now, he carried a rifle.

One day, as he trudged alone through the silence, the trapper caught a momentary glimpse of pointed ears protruding above a neighboring ridge. He did not turn and look that way, but presently he stopped, drew the silk shelter from his pack, and erected it roughly in the centre of the plateau. This done he grovelled a hole in the ground with his hand pick, laid something inside it, scratched back the dust, and lit a small fire over the spot. Soon he had coffee boiling, while the savory scent of frizzling bacon filled the air, then, as he sat over his pipe and the fire burnt low, he carelessly tossed a few scraps of fat bacon into the red embers.

Within an hour Wells had broken camp and was under way again, and

no sooner was he out of sight than Coyoteo and Coy came trotting over the ridge, to explore the old camping ground and see what the man had done—incidentally to nose to its origin that delightful sniff of bacon. There are but two things can hide the scent of steel, fire and water, and when the two jackals came trotting up the embers were cold—cold but seductive with the scent of frizzling bacon. Such dainties were for Coy, and seated on his haunches Coyoteo watched her scratching among the ashes for the tempting morsels. But suddenly there was a thud, and a little cloud of ashes rose into the air. Coy started back then grovelled down, whining, frightened, for she was a prisoner in the wolver's trap!

Yes, now at the time when they had least suspected danger—for had they not, hitherto, exploring the camping grounds of every traveller in these hills?—their curiosity had proved their undoing, and Coy, firmly held by a forepaw, knew that the dreaded hour had come at last. She rose, and backed away, dragging the trap from among the ashes, but to it was attached, by a length of chain, a heavy log of wood.

Coyoteo bristled as he watched, then he fell upon the trap in a fury of rage and fear, gnawing at the jaws, tearing at the springs, but still Coy remained a prisoner. He trotted off a few paces, whining to her to follow, and dragging the trap with her she limped a few paces till the heavy log hitched up in the sage bush, then she crouched and sobbed—long, pitiful moaning sobs that shook her whole slim body.

Again Coyoteo was at her side, rubbing his flank to hers, showering his kisses upon her muzzle, then he fell and attacked the log, holding it between his forepaws and gnawing it in a frenzy of hate. But the log was of well seasoned ash, and soon the splinters were stained with blood from the coyote's jaws, yet he had taught that log a lesson, taught it not to interfere, and triumphantly now he trotted off, looking back, and whining for Coy to follow.

Again she tried, but again the hateful log jerked her back, and she sank whimpering in the snow.

Coyoteo bellied up to her, grovelling, entreating, soothing her heated muzzle with his soft, warm tongue, peering up into her face, seeming to say to her—"Come away with me come! O leave this hateful thing behind!"

But he did not understand—he did not understand! Diligently now he began to scratch beside the log, but the ground was ice hard and he made no progress. He attacked the sage scrub, tearing at the roots and twigs, scattering the ground with them, then he scooped up roots and twigs, swept up little mounds of snow on and about the log, trying to bury it, trampling it in, then scooping more and more till the hateful thing was covered. Full of confidence now, assured that the chief hindrance was effectively done away with, he whined for Coy to follow, but as she did so the log was jerked from its covering and she sank trembling in the snow again.

"Coy -- Coy, what can I do for you? I know only that some great misfortune has befallen us, but I know not how to contend with it! I do not understand—I *cannot* understand!" He lay panting at her side, at times caressing her, snapping at the trap, the chain, the log, covering one then the other with snow, hiding them with infinite care, trampling them in, but always, when she rose to follow, the hateful things were there.

Over the brow and across the plateau there came a "tramp—tramp—tramp." Wells, looking back from a distant ridge, had seen the two coyotes, one fast in the trap, and so was returning home. As he drew near Coy lay very still, watching, watching, but Coyoteo fell in a frenzy upon the trap, the chain, the log, tearing at one then the other, while across the stillness rang the sound of his frenzied yaps and whines.

Only two hundred yards separated them now, and Wells dropped to one knee and fired. The bullet cast up a cloud of stinging snow at Coyoteo's

very muzzle, he stole back into the scrub, whining—calling, calling, for Coy to follow, but she did not answer. She looked up into the man's face with great, pleading, sorrowful eyes, while Coyoteo circled round watching—dreading—waiting.

IV.

Wells did not kill the little vixen, for he knew that he now possessed a certain bait whereby he could bring about the fall of Coyoteo, and that night found the little jackal chained by a heavy chain under the wall of his drying-out shed. She knew she was a hopeless captive, and having learnt the extent of her liberty she crouched in the snow, and made no further attempt to break away.

Long after darkness, when there was no sound in all the frosty land, there came a soft "gurr-woff" from among the boulders near. Coy answered it by a little soft note of similar kind, then full into the starlight opposite her, whining as he came, appeared Coyoteo. He carried something in his jaws, but for a long time he circled and sniffed, testing every foot of ground ahead, till at length, gaining her side, he dropped a dead bird at her feet and licked her muzzle. With little soft love sounds they nosed each other, Coyoteo licked and caressed her wounded paw, but he did not try to lead her away, for he knew now that it could not be so.

He came every night after that, appearing like a ghost from among the shadows with little cautious sounds of greeting, braving the man with his traps and guns, trespassing on his very threshold. Each night he brought her food, a storm-stayed bird or something picked up on a distant ranch, while he himself became gaunt and thin, for food was scarce. Little Coy ate nothing from the man's hand; Coyoteo supplied her needs, faithfully, lovingly, yet as he knew in mortal peril of his life.

And so Wells allowed the coyote to grow used to coming to and fro quite undisturbed, and then one evening he surrounded the little vixen with an impassable barrier of buried traps.

Coyoteo came as before, but he did not fall. Perhaps some warning from his little captive mate, perhaps his own quick senses, conveyed the hint, for at midnight the trapper heard the pitter-pat of paws across his very roof, then over the roof of the drying shed to a point directly above the imprisoned vixen. Here Coyoteo dropped to earth, and an hour later Wells heard the returning pitter-pat of paws.

Next day Wells extended his barrier of traps around the building, then betook himself to his trapping line.

It was a dull day and windy, and it happened that towards noon Bethman, passing that way, bethought himself to call on Wolver Wells. The disappearance of his dog had caused him much speculation, and though he had scorned the condescension of making a special errand of enquiry from the trapper special errand of enquiry from the trapper whose pointed warning he had ignored, this seemed a favourable opportunity of gleaning, perhaps, a little information.

But he found the door closed and the outlook bleak and lonely, so

spurring his cayuse he turned across the ridge.

Wait! Was that a coyote playing 'possum under the very wall of the outhouse? Without turning his head Bethman drew his rifle from his stirrup, swung round and fired at the crouching form.

The bullet grazed Coy's neck, cut the hair in a clean line down her flank, and she leapt and darted aside. As she did so the choking collar fell from her neck, cleanly severed by the bullet. She leapt again, but the chain did not jerk her back. Hesitating, uncertain, unable to believe, she leapt again—into and over the line of traps, then fleet as a deer among the boulders! In vain Bethman strove to bring the sights to bear, but his cayuse, started by the first shot would not stand, and Coy was free!

Away over the ridge and through the sage scrub, on three legs now but lighter than ever before, loped Coy, and by the frozen creek Coyoteo awaited her. Gaily he chased his tail, eagerly he licked her muzzle, then over the river flats and through the birch grove, heading now for quite a distant range, they ran flank to flank as in their honeymoon days.

English Partridges in British Columbia

ED. S. SHRAPNEL, R.C.A.

These fine game birds were imported into this Island several years ago and have increased very rapidly, the climate being very similar to that of England. They were placed on several districts of Vancouver Island. Last year for the first time sportsmen were allowed to shoot at them for the last two days of the season, in the District of North Saanach. Having experienced splendid sport at these birds over half a century ago, both in England and Ireland I was anxious to have another few shots at them. But it so happened that the days appointed so very late in the season turned out very wet, in fact, raining heavily all of both days, making trudging through the muddy fields and rotten stubble, anything but pleasant. The birds under such circumstances were very wild, making it almost impossible to approach

near enough to take a shot, large coveys gathered together and when started put a good mile between themselves and danger before settling again, greatly to the disgust of sportsmen generally, whose energy and enthusiasm was completely ruined. The opening of the shooting season for nearly all the species of wing game on this Island is far too late, as the weather is generally very wet in October which turns an outing for a few days with a gun, into wet misery and naughty cuss words at the framers of the game laws. The English game laws for all game would suit this Island perfectly in my opinion, and I have hunted here without missing a season for over twenty-eight years. There is a great necessity for really sensible and reasonable game laws for B. C. to be enacted in the writer's opinion.

The Kejimikijuk Monster

PHIL. H. MOORE

AS far back as 1902, stories began to drift into the settlement about him. Some fishermen claimed to have seen him and several claimed they had hooked him, and lost their fly or leader as a result. Some wise old fishermen on their first trip had the temerity to infer that it wasn't a trout at all but a mud-turtle or an enormous eel. For the next few years stories about him were consistently sprinkled through a great number of narratives told by various peregrinating fishermen from all parts of the world. Since all true lovers of the rod and reel, sooner or later, drop their fly in Nova Scotia trout streams, tales of the monster were naturally spread from coast to coast. Talking one day in Vancouver with the editor of a sporting magazine published in Chicago, I heard again the yarn with expected variations. This was in the winter of 1908. I remember the date well as it was the year our camp was built near the mouth of the Kejimikijuk River, on Lake Rossignol. The Chicago editor's story so impressed me, that I resolved to make some careful inquiries of the Indians and guides in the Rossignol district, as soon as we could get out to camp for the spring fishing.

Upon my arrival in Caledonia, I asked Old Joe and Darce, Frank, Tom, and others what they knew about it. They had all had experiences with him, or had guided "sports" who had either hooked or raised him. Although generally speaking guides are notorious fabulists these men seemed to be perfectly sincere in their belief that there was a monster trout in the lower waters of the Kejimikijuk River, ranging between Arthur's Ledges and the mouth. From their accounts there was a perfectly reasonable inference to be drawn that there might be a number of "him."

There was a peculiar similarity about the ending of all these fish stories. It seems that although the

fish had been authentically hooked a number of times, and played for some minutes, he would never come out of water but only show his enormous black back or broad square tail, at the time he took the fly; but after that would keep well submerged in the deep pools. No city fisherman had yet been equipped with sufficiently strong tackle to pull or "pump" the fish enough to take in any line after the first downstream rush of this powerful outlaw. He took line sometimes with a rush and sometimes with slow, persistent tugging jerks; then he would go into a deep hole, sound and sulk. Failing in his attempt to dislodge him, the angler, finding himself hooked to the trout instead of vice versa, would have the canoe dropped down stream so he could take in line and prepare for another rush. After navigating as close to the chosen lair of the big scrapper as was thought prudent the fisherman would increase the strain on his tackle to the limit, with the object of starting the fish. Finding no response to these manoeuvres, he'd try jerking and pulling and end by breaking his leader and losing it, or would give up the fight, slack his line, paddle right into the pool, pulling in the line hand over hand, only to find it securely wound around a submerged log or a wind-fall. Almost every story ended with the leader fast to a sunken log.

Ma-tee-o, an old Micmac Indian was sitting in front of his tent making pack-baskets when we arrived at our new camp at Lowes Landing, on Lake Rossignol, in the memorable spring of 1908. After partially getting our house in order, we wandered over, after supper, to sit with Ma-tee-o in front of his little Indian fire.

I asked him what he knew about the big fish. In the usual contemplative Indian way, he said:

"Him there."

"Just where, Ma-tee-o," I ventured.

"Sometime big eddy..... Trout Rock. Sometime Boom Rock, where

waters get mad." (He meant where the waters divide and run in separate streams to the mouth of the river.) "Mostly first big eddy.....dark side below Arthur's Ledges."

"Do you think there is more than one big fish in this part of the river?" I asked.

"Not like him," he replied quickly.

"Did you ever see him?" again I questioned.

"Three.....four time," said Ma-tee-o.

"Did you ever try to catch him?" I persisted.

Old Ma-tee-o's eyes twinkled.

"Me spear him once."

"You speared him!" We both exclaimed together, "How'd he get away?"

Before answering Ma-tee-o knocked the ashes out of his old pipe, and indicating a lack of both matches and tobacco by feeling in all his ragged pockets for them, he exercised the prerogative of the Indian race in its dealings with the intrusive white man and accepted my tender of both as his just due. Ceremoniously filling his pipe and tossing a pinch of tobacco over his shoulder to his friend the Wind, he lit up and courteously handed back my pouch. After a few quiet puffs he gravely proffered the pipe to the lady burdened with a portion of my (up to this time) good name. Outside of a humorous twinkle in his eyes, one would have thought his surprise at her confused refusal was genuine. Patiently waiting for Ma-tee-o to take up the thread of the tale of his experience with the big trout, I smoked and did not urge him.

"Wigumi," he muttered as to himself. Then "Adookse."

"It was this way, Camp-builder. I was young man trapping on Kejimikijuk River and Big Lake. Big and strong, then. (At this time Ma-tee-o was seventy odd years old, small and wizened.) "Plenty moose-meat, new squaw, two.....three.....papoose, wigwam on tenting ground at Trout Rock. New ice come quick. Had many steel traps set 'long the river. Had to chop 'em out. Found mush-rat in trap.....big eddy Ar-

thur's Ledges, I tole you 'bout. Ice just strong enough bear me up, and clear like house-glass. Mush-rat was drowned, but big fish under water smelling 'em,—maybe tryin' bite 'em. Made smash at fish with ax through ice. Missed him. By time get back to wickiup with hides and traps, tired but still think 'bout big fish. After dark take bark torch and fish-spear in kwedun and pole up river in swift water, and land on thin ice in pool where big trout live. The hole made to chop out trap had thin skin over it. So make li'l hole, tie piece moose-meat on fish line with sinker, put it down through ice. Then stick torch right long side on bank. It make big blaze. Wait with fish-spear to stick 'em. Wait maybe long time. By'm by, he come nosing 'long, easy, careful, like fox. He meskek fish. When he close to moose-meat-near-nough-Wiskoodaga! Hard! So." He indicated his spearing motion by a sharp downward thrust of the arm.

"Matee-o paused. We waited breathlessly. His pipe had gone out, so he "borrowed" another match and lit it. The old Indian's dramatic sense was acute. He had been engrossed in his tale. His sombre old eyes glowed, and as he sat there puffing his pipe, he was evidently picturing to himself again the wonderful moment when his spear struck true and fair the back of his monster trout. We knew it was best not to hurry the old fellow into what was to us, the important climax of the tale. Finally, exasperated at his silence, we impatiently urged:

"Did you get him, Ma-tee-o?"

"Spear him alright, Camp-builder. When try pull him out of hole in ice, couldn't lift him. Too big."

Again he paused.

"Did he break your spear?" "Did he wiggle much?" "Did he get away?" "What did you do then?" were the alternate exclamatory questions of his auditors. But Ma-tee-o couldn't be hurried. After puffing some more, exasperatingly, and poking his fire, he closed the matter up as follows:

"Pulled and pulled on spear. It won't come 'way; so take ax, and chop big hole in ice. Then build

nice bright fire on bank, so could see plain." He repeated the performance of pausing and teasing us at this particular place.

"Well?"

"Well?"

"Found spear sticking up over barbs in oak log."

We breathed again.

"How did you happen to miss him?" we asked, after we had digested this last bit of puzzling information.

"No miss 'um," replied Ma-tee-o. "Kespeadooksit."

And that was all we could get out of the old fellow about the big trout.

As we sauntered back through the moonlight to the new log-house, we decided to make a serious attempt to have an adventure with this mysterious and rapidly-getting-famous fish. I made up my mind if I hooked a fish that had the power of turning himself at will into a windfall, I would at least pull it out of water and burn it in the new fire-place and get a great deal of satisfaction out of giving the old rascal a brand new experience.

Next day, we made ready for the tournament with the crafty and legendary Salvelinus Fontinalis Mastodonus. I put together my five and one-half ounce, nine foot rod, and rigged it with a salmon reel, salmon line and leader. We took with us a split-ash pack-basket having a canvas cover, as a creel, and a book of salmon flies. Paddling across the overflowed meadows to the mouth of the Kejimikijuk River, a distance of half a mile, we assiduously fished all the pools in which this monster trout had been reported. We caught a number of big fish. As I was using a fly something over two inches long with a silver tinsel body, decorated with a pheasant and jungle-cock wing, (which I had tied myself) only a big trout could get the lure in his mouth. After sundown, we gave it up and paddled back to camp.

That evening I wandered over to discuss the subject once more with old Ma-tee-o. He was taciturn and moody, but finally volunteered this cryptic prophecy:

"No man catch 'um and kill 'um till all white men go 'way."

"Where will they go, Ma-tee-o?" I amusedly asked.

"Back to Boston," he grunted.

That ended the interview.

For four days following we tried each of the pools in turn. It was fine fun, fine weather and great fishing, but no monster trout showed up. On the fifth day the sun was so hot by ten o'clock that we quit fishing and, the black-flies not being yet much in evidence, we went ashore with our lunch basket at the old tenting ground below Arthur's Ledges. We lazed around till lunch time in such shade as the budding birches meagrely tendered.

As I idly lay on the moss, my eye caught a slight movement among the leaves near the lunch basket, and in a second or two a little kangaroo mouse hopped curiously toward it. I cautiously reached for the dip-net which was leaning against a nearby tree, and the next instant had Mr. Mouse all tangled up in it. A few seconds more and he was wiggling alluringly with the big hook of my salmon fly under his backbone. Playing our hunch for all it was worth, we stepped into the canoe, pushed out into the stream just above the big eddy and dropped the kelick and the wiggling, squeaking bait almost simultaneously into the water.

With fifteen feet of line hardly straightened out in the current, there was a splash, a tug at the line, a glimpse of an enormous square tail, and the reel sang "Home, Sweet Home." We had him! He ran straight down with the current making for the middle of the river. With 150 yards of real salmon line, a leader of the best gut, and a hook made for handling a twenty pound Nova Scotia winter salmon, I wasn't worrying much about that fish getting away, providing I could keep him from snagging the line. With seventy five yards of line out, I put on the brake. In ten minutes I had him quiet and gaping within reach of my dip-net. In another instant he was in the canoe, apparently drowned. He was a monster. The mouse was

gone. My hook was driven completely through the hard cartilage of his upper jaw. Two other small but much worn trout flies stuck beligerently from either side of his cavernous mouth, like Prussian mustachios. Many a ragged scar decorated his lips. Holding him up with a grin of glee to my canoe-mate who had greatly assisted with much advice whilst I was landing the historic warrior, she took his picture with the kodak set at a six foot focus, and the fine light of high noon at her back. Then I weighed him. Six and three-quarter pounds! I laid the now limp and quiet fish along the after thwart of the canoe and he just reached from rail to rail. By doubling him up in a half circle I put him in the pack-basket creel, ostensibly his last resting place—but one. Reeling up my slack line and making my tackle snug, I took hold of the kelick rope which passed through a pulley on the bow of the canoe and aft to a cleet on the thwart just ahead of the stern seat, and tried to pull it up, so that we could go ashore and have our delayed lunch. The kelick, which was a five prong grab-hook, was snagged and would not come up. After trying to dislodge it by all conservative and traditional methods, my partner, in this plot against our finny antagonist, made the fatal error, (I regret to say at my direction), of moving up into the bow of the canoe to take the anchor rope in her hands. The current was very swift. This action of hers made the canoe bow heavy, and it immediately began to switch back and forth with darts of increasing length, while she was tugging frantically at the obstinate hook. I did my best to hold the craft steady and pointed up stream. The next instant it gave a lurch and we both leaned to the high

side. Immediately this was the low side, so low that the water poured over the gunwale. We swamped and tipped over. Assuring my breathless and spouting partner that there was no danger, a few strokes brought us both to shallow water. With the lady safe and some of the water out of our eyes, we spotted the creel floating downstream half submerged but upright.

"The fish!" we both exclaimed, horror-struck.

Unsheathing my hunting knife I made for the canoe. Cutting the entangled anchor rope and towing it ashore was the work of a moment. Rod and dip-net, and one of the paddles were caught under the thwarts. The camera was gone. I had dumped the water out of the craft, jumped in and was paddling frantically after the big creel, almost in one continuous motion. When within a few feet of it, and perhaps 100 yards below the scene of the accident, the basket gave a lurch and tipped on its side. The cover floated partly open; and as I shot alongside and made a desperate lunge for it, our big fish, with others, floated out on his side. He quivered, gave a sluggish wriggle, righted himself, and with a disdainful flap of the big tail darted into an eddy behind a big rock.

Perhaps Old Ma-tee-o was right.

But the big fish is still there ready to break a lance, (or bamboo), with any doughty knight of the rod that comes along.

Key to Micmac words:

Wigumi—"I am fond of smoking."

Adookse—"I will tell a story."

Meskek—"Great, enormous."

Wiskoodaga—"I stab him."

Kwedun—"Canoe."

Kespeadooksit—"The story is ended."

THE MUCH RENOWNED TURKEY

The North American wild turkey is the original species of the Eastern United States, known scientifically as *Meleagris Americana*, whose colors are black, beautifully shaded with a rich bronze, the breast plumage being

dark bronze, illuminated with a lustrous finish of coppery gold. This finish of bronze and gold emblazons the entire plumage throughout as if burnished into brightness. In the rays of the sun it shows a most beautiful combination of bronze, black, copper, and gold.—T.H.H.

The Bow and Arrow

[In Two Parts]

Part I.

ROBERT PAGE LINCOLN

THE bow is a weapon with rather a brilliant history. Perhaps it found birth with the stone age gentlemen and gentle women, for stories of those hunts of yore, in quest of the giant mammoth have been found carved on the walls of known caves. The bow played a prominent part in wars that have decided the fate of nations. The long bow and the cross bow were used by the English in actual service as late as 1585 when they participated in the freeing of the Netherlands. The bow, no doubt was a dangerous weapon when in the hands of a strong man: and some of the deeds of the early archers still go the rounds: though the majority of these are fairy tales pure and simple. Figures in history such as Robin Hood and William Tell stand out prominent, of course and will always be remembered for their exploits; but their deeds have now, properly taken their place among the narrations of mythology. In savage countries today we find the natives using the bow and arrow with deadly effect. The bow is to these natives not only a weapon of defense against their enemies but is a means of providing them with their daily meat. Travellers into the interior of South America often fall under poisoned arrows. The method of poisoning these arrow tips is explained thus: The liver of some large animal is suspended to the end of a stick. A rattlesnake is then hunted out and is made angry, when properly incensed the liver is thrust at him. He sinks his fangs into the liver and exudes his deadly poison into it. The native carries this liver about, allowing three or four snakes to thus exude their poison into the bait and then it is taken away. After the

poison has thoroughly soaked into every portion of the liver the arrow tips are thrust into it—thus covered with the vicious liquid and when dried they are ready to be used. Needless to state the arrow thus becomes a menace of the worst stripe: sure death to the one hit with it in a vital spot!

No doubt in the early days there were men so proficient in the art of archery that, were they living today, our wonder would be aroused. However a veil has fallen upon the past and we have no detailed accounts coming up through history to direct us right on this score. The Cossacks of Russia were brought up to be horsemen from their very youth; and naturally they have been the most daring and efficient horsemen and cavalymen in the world. In the early days in England men were reared and taught archery from the cradle, one might say: the ultimate goal of every archer trained being his position on the battlefield. The bows of the early archers in England were made of the famous yew: but so persistent was the demand for this wood, and so little was it grown, or cultured that today it is hard to obtain, if it is obtainable at all. No doubt the yew-wood makes for the best wood obtainable, when it is dressed into a bow-stick.

There are societies of Scottish archers who occasionally shoot at marks set up 220 yards away: but the bow used is the war-bow, or the bow of the chase. The mark at 220 yards is sometimes hit—most of the time not. Flight shooting with the bow is not practiced to any great extent in our day: although flight shots up to 300 yards and over have been made with the ordinary wooden bow. However with the Turkish composite bow

greater flight shots have been made. This combination bow is made of sinew or raw-hide wood and horn. In the year 1795 the secretary of the Turkish Embassy in London shot an arrow 482 yards, so the story goes. Some years ago at a meeting of archers at the *Société des Sports du Touquet*, in France, one Ingo Simon, with a bow of 80-lb. pull, shot an arrow 459 yards, 8 inches. The distance was later measured by a professional surveyor and one Mr. Nesham, a leading English archer.

In the United States the leading archers have always had their meets: and tournaments have been staged. Edward Weston and Will Thompson have been the high lights in this unique sport and through their efforts, and through the efforts of other enthusiasts, archery has taken a fairly prominent place among the outdoorsmen: although it is doubtful if it will ever get beyond the minority it now has to its credit. In more recent years a great deal of interest has been added to the sport by the fact that a number of archers have gone on hunting trips and have not only killed small game, but also deer and bear. Last year, I believe Arthur Young and Saxton Pope of California attained to the record height as archers in this country by killing a bear: but I understand that they fairly riddled the animal. These two gentlemen, by reason of their hunting experiences are worthy of special attention. To kill bear and deer with a hunting bow is indeed something that is far and beyond out of the ordinary. Let me quote from Saxton Pope, for what he says is singularly interesting:

"For the past three years," says Pope, "W. J. Compton, Arthur Young and myself have been hunting with the long bow. We make our own weapons of Oregon yew. They are the height of a man and pull fifty to eighty pounds. The string is made of Irish linen, one strand of Barbour's, No. 12 for every pound of pull. This is well waxed and twisted. The arrows used for hunting are made of birch dowels five-sixteenths or three-eighths of an inch in diameter and twenty-eight inches long. Some arrows for shooting small game are blunt-pointed. They are made by inserting a round-headed screw in the shaft and binding the end with fine wire. Arrows for killing large game have a steel head, shaped in the classic triangle, an inch and a half long and one inch broad. These are kept very sharp by filing them. We carry about three dozen on a hunting trip and shoot some many times. We have hunted all sorts of game, bagging scores of quail, rabbits and squirrels. Foxes,

coons, skunks, and other predatory varmints have been taken into camp. These have been shot at distances ranging from ten to fifty yards. In one afternoon Arthur Young killed seventeen ground squirrels with the bow. The last five of these animals he killed with five successive arrows. In the line of big game in the last three years we have killed half a dozen deer. Two years ago Compton shot a running buck at 75 yards and drove an arrow through his shoulder, up to the feather. This deer dropped after plunging down the canyon a couple of hundred yards. One season Young got a three pointer at sixty yards by a shot in the flank. The deer jumped a ravine and sought shelter in a bunch of bay trees. Young landed a second arrow through the breast and put him out of commission. On the same trip I, myself, shot a forked horn at 65 yards, *driving an arrow clean through him, the arrow flying twenty yards beyond.* The deer ran some thirty more yards, staggered and was killed by a shot through the heart. He dropped without a struggle."

The shooting of an arrow through a deer at 65 yards, the arrow going clear through the deer and twenty yards beyond surely points to one thing—the man that pulled the bow that sent that arrow on its mission of death is a powerful man operating a powerful bow. Step off 65 yards and then you will know what a feat such as this means and you will know that shooting with the long bow is far from child's play. It is an art that should appeal to black-smiths on vacation.

When Young and Pope killed the bear previously spoken of, they were using bows with a pull of 70 pounds; that is to say one is forced to pull 70 pounds to bring the 28-inch arrow back to the head before it is released. Now I have operated smaller bows up to forty pounds pull and I know therefore what one pulling to 70 pounds is capable of, and I know it takes a man with strength to do it and I know that he must be a perfect bow-man to make a successful hit with a bow of that calibre. Therefore one marvels when Saxton Pope tells of shooting a deer at 65 yards, the arrow going through the deer and 20 yards beyond. And furthermore I believe every word of it as true, for I do know what power there is in the right kind of a bow when you bring the arrow back to the head and let it go.

A recent writer in commenting upon the above bow-work of Young and Pope, says:

"The best living archer in America or England would probably hit a target four feet in

diameter with about two-thirds of his shots at 100 yards. In a long string of shots it is barely possible that he might hit such a target with ten shots in succession. His chance of hitting a man at 100 yards would probably not be better than one in two. A man who is a good shot but not a champion would consider that he did excellent work if he hit the four-foot target with half his shots. Of course either man might hit a blackbird at that range at the first shot, but the chances of doing so are very small. At 60 yards our champion archer would seldom miss the four-foot target and the great majority of his shots would hit the size of a man. Our good archer, not a champion, would occasionally miss the four-foot target at 60 yards, but would frequently hit it with thirty or more shots in succession. The champion might hit a duck or a prairie chicken with one shot in three or four at this range, while the ordinary good archer would do well to hit it with one shot in ten. At 40 yards the champion archer by great good luck and much skill might hit a ten-inch circle with ten successive shots and in the same manner he might hit a four-inch circle with ten successive shots at 20 yards. The ordinary good man at archery may perhaps shoot a lifetime without hitting the 9.6 inch bullseye of the target with five successive shots at 40 yards. Only the slightest comparison of these records with those made every day with the revolver is necessary to show how immensely difficult archery is as compared to the work of any firearm. I am a fairly proficient rifleman, but it is my deliberate opinion that at least twenty times more practice is required to make a good archer than is required to make a good rifleman."

If one is able to purchase a yew-wood bow or make one of that wood he is fortunate, for, no doubt that is one of the best materials to be had in the world outside, of course, the composite bow which is made of a combination of materials as before stated. Yew wood is of the species of *Taxus*, a genus of conifers. Here is some data I have picked up:

"The yew is distributed throughout the northern temperate regions. The most noticeable peculiarity of the genus is the development of a fleshy (usually scarlet) cup (*aril*), about the naked seed, making the fruit look like an open berry. The common yew of Europe (*T. baccata*), very often cultivated, especially in cemeteries, is a tree of sombre aspect. Veneration and superstition have long clung about it. It lives to a great age in the

Old World. The America (*T. Canadensis*) is a more or less prostrate form, which is especially abundant northward; a stunted shrub with very tough wood."

It is no doubt of this American yew that Saxton, Young and Pope make their strong bow; they mention "Oregon yew" I see. Lemonwood is said to make for a fine bow. I have never laid eyes on one and have never tried one. I have, off and on from youth up, made bows of various materials—and have had good success with the ironwood. Other woods that may be tried out are young oak, birch, hickory and ash, all of which are more or less easily obtainable, depending of course what part of the world you happen to be in. As stated, when selecting a piece of bow-wood the idea is to get a stick that is as free of knots as possible. Second growth wood is by far the best as it is of the toughest fiber. Try to get a piece that is five inches through, if possible. You may have to search a while but it will pay you. Obviously a bow of green wood is useless as it has little or no force; at least it is not powerful enough to send an arrow any distance, and when it dries out it is liable to acquire a "set" that spoils it all. Many young fellows who have always wanted to make a good bow, (but have always failed from start to finish) will read these directions with care and then try again.

The piece of bow-wood, in the crude is shaped down with a draw-shave, knife and large plane; when the bow is to be finished off a small block plane is used and after that some medium or fine sandpaper. However now that you have the piece squared down in the crude form the next thing that must be done before it is seasoned is to harden it. This is done by boiling the wood in a strong solution of salt water; a regular brine. Thus after the piece has been thoroughly boiled it is taken out and while it is seasoning either up in the attic, in the hayloft, or by subdued stove-heat (though not too close to the heat) it is whipped into shape by bending it often and it is examined for cracks and splinters. If the piece cracks throughout (as is often the case if you have allowed it to be in the sun or if you have had it too close to the stove) it is useless. The piece should be without splinters and cracks. When it is well seasoned, work is begun on it by shaving it down. Some have the piece cut down very close to the thickness of the bow before boiling it in the salt water but as between the two methods I cannot say that one is better than the other, although I do know that the seasoning of the

FIG 1

 B. Shows the fingers on the cord; looking at them from in back.
 C. One of the limbs of a bow, a shape at two vital points.
 D. The bow cord at the upper notch on the bow, same being readily slipped off
 E. The cord in the lower notch, tied across to dull the "twang" or vibration.

piece is the main thing to use care about. As you work the piece down to the bow size whip it into shape by bending it often and working it back and forth. By so doing you will note if there are any defects in the curvature in either of the limbs. The limbs, as we call them, are the two sections one on either side of the given centre. The centre of the bow it should be remembered is not drawn upon for the greater energy; but the limbs, one and one half to two feet back from either end of the bow contains the power, the spring; this is a point that should be remembered in the construction of the bow. When you draw the bow back, held as it is at arm's length, the string under the chin, the two limbs must answer perfectly—a perfect sweep, one limb not out of curve, while the other is perfect in curve. If one is out of curve, it must be trimmed a little to remedy the condition. As you work the piece and test it by drawing it back have someone study the curves of the limbs or, better yet, have someone draw the bow back from at arm's length and you, yourself study the curves. This is the best way.

A short bow I find will have a sharp force to it; while the longer bow will give a more uniform force, and, as a rule is the more

powerful. Nevertheless, the Indians had bows as short as four feet reinforced with sinew that, having a pull of forty pounds to them were certainly dangerous weapons. It will be remembered that the Indians would ride in amongst a herd of buffaloes and drive their arrows very nearly through these gigantic animals. But of course they were "right on top of them" when delivering the barbed shot. In the short bow there is produced an uncomfortable "twang" when the string is let go that produces a vibration that I for my part have never been able to remedy, even by reinforcing the ends with cord and by whipping the bow-string to stay at the lower end of the bow. You will have more or less failure with the small bow so talk of it is dropped.

The average bow in use is the height of a man; thus bows of five and one half to six feet are the most common. This bow when finished should have a perfect balance; that is to say when you place the bow across your fore-finger to balance it, at the centre, it should balance even. If one limb out-weighs the other there is something wrong in its construction.

(Concluded in November.)

Valuable Insect Foods for Pond Fishes and How Obtained

ROBERT PAGE LINCOLN

THE feeding of fishes reared in ponds is, often as not, a troublesome matter with many amateur culturists and entails a vast amount of labor, not to say expense. It can surely be said that a food supply for fishes during the summer and autumn is easily obtainable if one is but put on the right track and by a little care he will be able to feed vast numbers of pond fishes at little or no expense. No doubt pond culturists look upon the feeding of the fishes as one of the great stumbling blocks in such enjoyable and profitable enterprises, for the fishes must be fed regular, and of a food that is nourishing and at the same time eagerly taken by the fish without wasting it in the water. In early feeding the fish before they have attained to a fingerling or approaching fingerling stage, liver is used which is grated through a wire netting and is fed in that manner or is mixed with cereals thus forming a very desirable material. In a like manner rough fish are killed and the flesh grated or rubbed through a wire netting, the same being fed to the trout or the bass. But as the fishes grow they become all the more ravenous and they must be fed in proportion to their increasing growth. Therefore such flesh, liver and chopped fish that is fed into the pond must be hacked into small bits instead of grated. In the case of the basses; carp minnows, chubs and shiners are released alive in the ponds and these the basses, etc., chase down and feed upon. It will be noted that in all writ-

ings on fish culture it is mentioned that releasing minnows alive in the ponds is a good thing to do, in that the fish get a great deal of energy in chasing and hunting these minnows down. Minnows, on the other hand are hard to obtain. There are just certain times while the rough fish and others of the minnow family are breeding and produce and during such times these minnows may be netted and used. In cases where a fish pond is big, or where the establishment is run on a large scale of many ponds in connection then it is a good idea to spawn out carp in ponds especially to obtain the myriads of minnows that are thus produced for feeding purposes. But as I have said before one should be very careful not to feed in too many of these minnows but so that it is certain that the fish in the pond obtain them all. Chubs are known to be able to hide away from the basses and when this happens they do a great deal of havoc in killing young bass minnows. Carp fingerlings also take to feeding on bass fry if they are able to escape the basses in shallow water which is always the case where such fry is released into a pond in undue numbers.

Naturally rough fish as a food for pond fishes are the easiest to obtain,—but of course this entirely depends upon the section of the continent you happen to be in. In some places rough fish are not obtainable; in other places they are found in extreme abundance. Where rough fish for food is not readily ob-

tainable other fare, including cereals, must be fed to the fishes. Yet, in the main some of the best foods to be had are over-looked, or are near to hand but cannot be taken principally through lack of knowing how this is done.

Insect life of the earth and the air form a means to a food supply for pond fishes that is usually passed by but which should be introduced everywhere. I personally know of no fare for pond fishes so very desirable and so cheap to obtain as that afforded by the grasshoppers, that, through the summer and autumn teem in the fields and the pastures; and the flies which are such a nuisance about the barns and the house.

We have seen that the pond fishes, whether basses or trout, desire, most of all the insect fare that is offered them. This is natural. They rise to the surface to take it. In a native life, or primitive state in the wild waters they live almost entirely upon winged food coming to the water—especially is this true about the trout. In the case of the trout ponds it has been a rule to hang up parts of the entrails or carcass of an animal over points frequented by the trout. The flies lay their eggs on this carcass and the resulting maggots fall to water and are seized by the trout. Personally I think that this could well be discarded if the flies themselves could be captured and fed to the fish.

Whatever may be said about the house fly a trout would tell you if he could speak that that same house fly has a generous amount of protein stored up in his body that goes all the way to construct a square meal. All the trout desires is to obtain a few of these and he will consider it a full meal, even as, in a wild state he considers the few flies that he catches sufficient for the meal he makes two or three times each summer day.

Fly traps have now been in use for many

years, but it is highly doubtful if one person out of a hundred knows how to make one for himself to catch, practically all the flies on the place. Yet the fact remains: fly-traps are easily made and the style I am going to mention further on is so simple and so very effective that it becomes an "instrument" that should be in every barn and in, or on the porch of every home. At the same time such flies as are taken can be utilized as food for fish ponds in a very unique manner. Let me mention an incident. The town of Pomona, California is liberally set with fly traps. Naturally the fly population live long enough to enter the traps on one corner of the town or another *and so cease to function as disease-carriers*. This year a large fish-rearing establishment in the neighborhood has contracted for the entire fly harvest, the flies to be collected once every two days or so. These flies are then fed to the trout, the result being a wonderful food supply hardly to be equalled. When you consider that a handful of flies will go a long way in feeding a young trout you will realize that a fly trap or two around the house will help out a great deal. Throughout the summer and autumn seeming millions of flies may be harvested in and made use of in a profitable manner as can be seen.

In Figure 1, we show a simple type of a fly trap that is easily made by anyone who has an hour to spare and the material with which same is constructed. What I call the regulation size is exactly one foot square as to bottom and top, and eighteen inches high. You can obtain the material for this top and bottom out of the ends of boxes to fit you out to a T. Having two ends cut one foot square, the next thing to do is to cut holes in the centre of each six inches in diameter. This is done by making a pencil-ring, then boring a hole at the edge of the line and then

FIG. II

cutting out the same by means of a key-hole saw. In (A) of Figure 1, we give an idea of this. When you have completed this you next turn to your screen material; and this screen should be of the white sort as this is much better than the dark porch wire netting. You now take a part of this screen and roll a cone out of it, fastening the sides of the screen together carefully but leaving a hole at the top of this cone about the size of a pencil. The bottom of this cone should answer exactly with the hole you have cut in the bottom; and when this is fitted in it is tacked around the edges. When the cone with its pencil-like hole at the top is fitted in place it will look about like (B) of Figure 1. This cone stands seven or eight inches high. It is in the centre of the circle.

In (C) we show the fly-trap completed. The up-rights, one on each corner are of one inch material and should be eighteen inches high. These up-rights are nailed to the bottom having the cone of wire; then the top is nailed on in the same manner. You now have the whole ready to be screened in. This is very simply done, care being taken to get the screen tight over all. As stated the top has a round hole to it too. In (D) of Figure 1 we show a door made of screen, in a square style that can be fastened to the top with small hinges, same to open at ease to be hooked again tight when the flies have been taken out. Little bits of wood, three eighths of an inch thick are now nailed to the bottom of the cage, one on each corner as shown in the drawings—and the trap is ready to be used.

The bait is sugar water mixed up with bran, a new portion being filled in as needed. In hot weather it rapidly evaporates, and what with the amount sipped up by the flies it goes fast. Place the trap in a doorway of the barn for instance, sweeping the floor clear all around. Take the cover of a small baking

powder can and place the sugar water and bran in that and place the whole on the floor in the centre of the cone, the cone thus being directly above it. Sprinkle a few drops of sugar water on the floor around and the trap is ready. The flies in going in to the pan on the floor creep under the trap by means of the space offered by reason of the three eighths inch blocks of wood on the four corners. Instead of creeping out by the way it came in it is in the nature of a fly to go for the light, so it rises and a-lights inside the cone, and then travelling up the side of the cone it passes through the pencil-like hole at the top and into the interior of the trap. The result is imprisonment. In hot weather quarts of flies may be taken out of these traps, and through the season millions of flies are speedily eliminated thus preventing a spread of disease and in the case of the fish culturist aiding him in producing food for his fishes. After a day in the trap these flies are dyed and creep around on the bottom. They may then be taken out by hand and thrown to the water where the fish will take them.

We have now pointed out how a fly-trap may be made. Now we will give an idea on how grass-hoppers may be harvested in the infested fields and pastures and so brought to use. Everyone is cognizant of the fact that grasshoppers are exceedingly high in protein. Many Indians in the West trap grasshoppers in ditches, dry them and then grind them up for bread. Men who have eaten of grasshopper bread state that it is of a fine flavor and very nourishing.

On the other hand there is nothing a thriving bass colony loves so much as a feast once a day of grasshoppers. Fact to tell they can live on a few grasshoppers alone, such is the high value of the jumpers as a food. During grasshopper time in Minnesota the lakes along the shores are crowded with these jumpers and the bass glut themselves; they

are then hard to connect with *via* the hook and line. At the same time the bass are then in their choicest condition. Amateur fish culturists often dig holes in the fields and so catch the hoppers, for sooner or later they find their way into the hole. However, there is a more efficient manner of catching them wholesale and the trap to do it with is illustrated in Figure II. This affair (see A) is sixteen feet in length though it may of course be made shorter to suit your needs. If you are in the real grasshopper infested country a trap of sixteen feet is what you want, the same to be drawn by two horses, one hitched to either end. Note that the trap sits on four sled-like runners. Along the whole front of this trap extends a curved piece of tin; and this tin drops down into an opening something like two inches in width as shown in (A) and more clearly in (B). Now when this trap is drawn through the fields or short grass where the earth seems fairly alive with the jumpers they hop up and in doing so they strike the side or the curve of tin, as shown in (A). When the hopper hits the tin he slides down and falls into the gutter, thus striking the bottom. He then goes through the opening into the cage and is there imprisoned. The sides of this trap are covered with screen and there is a place in the centre where there is a door, at the top, and through this door the hoppers are shovelled out and fed to the fish alive. In the case of chickens the hoppers are often dried in sacks and mixed up with common feed. This makes one of the most

nutritious foods that one could possibly offer to fowl, and, as a rule all this supply of insects goes to waste by reason of man not utilizing what he has at his very back door one might say. Of course the grasshopper trap may be made in a large style to be pulled by horses or it may be made in a smaller style to be drawn by hand. A few turns of an infested piece of land will yield a vast supply of food for the chickens or the fish in your ponds. Grasshoppers and flies are trapped all through the summer and into the fall. Usually when a hopper trap is drawn around a field the outer turns are made first, thus working toward a common centre. In this manner a field is pretty well covered.

Man should always look around him and make use of what Nature sows with such a prodigal hand to right and left. There are foods that generally go to waste that otherwise will make man a profitable entry. As you walk out among the oak groves in the autumn and you see the ground fairly littered with acorns did it ever occur to you that this contains a food for chickens that is beyond equal. When I say that I know it to be the truth. Gather up all the acorns you can lay hands on, grind them up and mix this with some other chicken feed and you will be surprised what benefit will come of the experiment. After all this is merely making use of what we find at our very door. The food value of an acorn may be well understood when one understands that each holds a potential oak tree within itself.

GUNS & AMMUNITION

Methods Used in Testing Shotgun Powders for Pressure

C. S. LANDIS

RIFLE and revolver cartridges have three principal variables: the bullet, the powder, and the primer. Shotgun shells have four: the primer, the shot charge, the powder and the wads. At least four wads, usually all different in thickness, hardness, and strength, are required and yet many men consider the loading of shotgun ammunition a very easy matter. I suppose that this idea is brought about by the fact that shotgun pressures are comparatively low and the lack of accidents resulting from mistakes in loading is likely to convey the impression that the loading of shotgun shells is not a very important matter.

The shot and primers are generally overlooked by the sportsman who considers the usual variables as the wads and the powder. The wads are usually selected for their durability and cheapness. This leaves us the powder, which is the life of the cartridge.

How Powder is Made and Tested.

Smokeless shotgun powder is usually manufactured in ten thousand-pound lots. Each of these lots is blended until every portion of it is identical. While the lot of powder is being packed into containers, a one-pound sample is taken from it at intervals until fifty samples are secured. The gravimetric density of each of these samples is determined, to show whether the lot throughout is uniform.

From each of these fifty samples, a quantity is taken and subjected to complete and exact physical, chemical, and ballistic tests.

After the powder passes these tests, the canisters or drums are scaled for shipment.

The two general classes of shotgun powders

are bulk powders, which measure bulk for bulk with black powder, and dense powders, which require a smaller charge to produce the same ballistic results.

The Pressure Gun.

The pressure gun for testing shotgun powders has a barrel drilled out in one or more places for the insertion of plungers. The plungers fit the holes very closely to prevent gas leakage. Large screws are provided opposite these holes, so that the lead pressure gauges may be held in place during the explosion. When the shells are loaded, they are first drilled as shown in the photographs and then the drilled holes are pasted over by paper stickers to prevent the powder from being spilled after loading.

When the shells are loaded, a lead crusher is inserted between the plunger and the screw. The screw is turned down onto the plunger until the lead pressure gauge is firmly held in place. The loaded shell is then inserted into the chamber of the pressure gun and the charge is fired.

The explosion drives the plunger against the end of the lead crusher, which naturally compresses it. This lead slug is then measured and the new measurement gives the amount of compression. These measurements when compared with the table for that set of crushers give the pressure per square inch. The pressure gun is usually known as the V.P. (velocity pressure) gun, as the velocity and pressure can both be determined from it by the use of a chronograph.

Types of Pressure Guns.

There are two general types of pressure guns in use in this country. One is the

The Webley V. P. Gun

Webley gun, a photograph of which is reproduced herewith, which weighs fifty pounds. The other is the Baker pressure gun.

Both types are suspended on wires as shown in the photographs. With them, pressure can be taken at two or more places in the barrel, the points at which the barrels are drilled. The time necessary for any load to travel the length of the barrel of the gun can be determined, as well as that which elapses between the blow of the hammer and the time the shot emerges from the muzzle. This gives the degree of quickness of different powder loads, and the chronograph also measures the velocity (average velocity) over any given range. In addition, the patterning sheet will give the pattern and the evenness of a shot charge at any necessary range.

One of the things a pattern sheet will show is that a gun with a three-inch chamber that will pattern 70 to 75 per cent. with three-inch shells will sometimes average about 55 to 60 per cent. with 2 5/8 inch shells. So, therefore, the shooter who has his gun chambered for any length of shells should stick to this length unless he finds by actual tests his gun handles others equally well. Oddly enough, a long chambered gun will frequently shoot a 3 1/2 dram load in a

a 3-dram load in a shell of the same length. I have seen this actually tried out on an indoor forty-yard range.

Shotgun powders are made to burn at lower pressures than rifle powders, and therefore lead crushers are used to test these pressures, while copper crushers are used to test the rifle powders that burn under higher pressure.

When any set of pressures is taken to test a powder or a given load of any lot of powder, a series of ten or more shots is fired and the results compared to determine the maximum and mean pressures developed, which show whether the lot under test is satisfactory from the standpoint of

pressure. Testing for pattern and also for velocity, as well as for pressure, is always done before any lot of powder is passed as suitable for the market.

The ideal that the ballistic engineer or chemist who designs the powders, works for is low, *even* pressures, dense, *even* patterns, and *even* velocities.

The chronograph gives the velocities exactly over any given range or any number of ranges, the pressure gun gives the pressure at any point in the barrel that it may be designed to obtain, and the pattern sheet tells its own story at any given range; therefore the ballistic engineer can determine exactly what results he has secured. He can tell by

previous chemical tests whether the powder in use will satisfactorily withstand climatic and temperature changes. All powders are tested for excess of moisture and for durability.

Bulk powders and dense powders are both tested in exactly the same manner as, also, are all gauges of shells from 10 gauge to 410 gauge. The ballistic engineers employed by the large powder companies and by the cartridge loading companies test and re-test each combination of powder, shot, primers and wads in so many pressure guns and chronographs and under so many conditions that their results have naturally averaged themselves, so that the standard loads for the different calibers have been developed.

Whenever some experimenter comes out with a new combination of powder, shot, and

shells that he claims gives results that are from 50 to 100 per cent. better than those secured from the so-called standard loads, it is well to take these statements with a certain degree of reserve, because if they were tested in a velocity pressure gun, they would likely show some striking results regarding pressures and velocities of which the experimenter had very little knowledge. There is nothing dark or mysterious about testing powders or ammunition. Each combination will tell its own story if given the opportunity.

The photographs reproduced herewith were taken at the Ballistic Station of the Hercules Powder Company, the manufacturers of Infallible shotgun powder, and will show the kind of equipment that is used by the large concerns in testing their products for American sportsmen.

A New Job for the Lead Bullet

J. R. MATTERN

A GUN-LESS or at least a rifle-less or shoot-less country is not exactly the average man's ideal of a desirable condition to wake up some morning and find North America in, but for the hunter that is what the war almost brought. The trouble was principally with ammunition. It was getting scarce last year when the war ended. How scarce it was—how completely the factories had been turned from hunting and target stuff to war materials by their owners and by the Government—few realize, and only another year or two of war would have shown to shooters in general.

Now it may be urged that in war time hunting and target shooting by the stay-at-homes is not exactly in good taste, like dance music at a funeral. But modern fighting has peculiar ways of calling up this man and leaving that one behind without much regard to their knowledge of shooting, and there are little matters of training the oncoming youth in shooting, of recreation for the workers, and of game as an addition to the food supply, that make weighty arguments in favor of some home shooting being a graceful and handy thing after all.

Every genuine rifleman knows that he needs his shooting during an emergency just as much as during the piping and balmy times, of peace, even if certain good but thin-blooded individuals think otherwise. And yet there

was a time when the needs of the Government cut down the cartridge and shell supply almost to the vanishing point. Perhaps the desire of the thin-blooded pacifists above mentioned to disarm all private citizens, helped too, a little. There are many who would like to see us all living under Sullivan laws that applied to rifles and shotguns as well as to short guns. Maybe scarcity of metals and other materials contributed, along with limited factory capacity and a lack of enough skilled cartridge makers. The sum of the matter is that individual shooting would have been almost impossible within a few months, and the particular point to be emphasized is that it was through our dependence on factory ammunition that the calamity almost happened.

Until the nineties or a few years later the annual factory output had no such stranglehold on the activities of shooters, for the rifles of those days handled bullets of lead that could be cast at home. Most owners of rifles also owned reloading tools and knew how to use them so well that the factory product had hardly an even break with the home-made. Twenty years of progress in the shooting world has changed all that. The .303, the .30-40 and the .30-30 arrived, and then in succession all that brood of high-powers that shoot hard and straight and flat, and that require their lead encased in a skin of nickel or copper. Throughout Canada and the

United States it is the very, very exceptional man who appears on the range or in the woods with a lead bullet rifle any more. There are such, of course, but there are ten who use metal-cased bullets to every one of him.

To go back for a minute to the war condition, it has been proved that any one of several influence can choke off the flow of ammunition from the factories for a number of years at least. It would appear, then, that the man with the rifle that used only metal cased bullets is depending on a spring that may go dry. Suppose another war happens along. Suppose there are scarcities of metals, or powders. Suppose there are strikes. Or suppose some fanatical politician, unable to achieve his dream of a gunless country by direct means, should succeed for a time in throwing so many restrictions round the sale of ammunition as practically to make new cartridges inaccessible. It is easy to see how any of these four causes, or of a dozen others not named, might again produce the same condition that the war nearly brought about last year.

With these possibilities in mind, therefore, a good many riflemen are backing up their modern shooting equipment with one or more smokesticks that are more independent of the modern factory for seed. These reserves may not be used every month or even every year, but they are on the job. Rifles

of .250 and the 30-1906 caliber, to take two of the best examples of the newer cartridges, have advantages over any strictly lead bullet rifles, big advantages that make them worth the preference of every hunter and target shooter. And yet a 45-70 or a 38-40 provided with cartridges beats the best Savage or Model '95 Winchester that ever came out when it is without ammunition. It is the metal cased bullet that chiefly causes the trouble. Powder, primers, empty shells and lead can be stocked at home or can be obtained from many sources even during emergencies, but to keep on hand several year's supply of metal cased bullets would require a mint of money, and to get them after the clouds gather is impossible.

One old hunter who has used a .30-06 Winchester carbine for years has lately bought himself a .38-55 Winchester to keep in reserve for this reason. Another fellow who has a flock of high power rifles keeps a .45-70 Light weight Winchester and a .32-20 Marlin back in a corner of the cabinet. A third man owns and shoots a .22 High Power, but has a .38-40 back at home that could be useful in an emergency. Even the Editor of the Gun and Ammunition Department hangs on to his old .25-21. Still others adapt a plan that will be mentioned farther along. It is an idea in preparedness worth keeping in mind. The crank is using it joy-

fully as an excuse to add a couple more guns to his collection without blushing. The one-gun man, with his .30-30 carbine or his automatic, is grimacing a little over the new tax, but is wisely coming across in numbers. He usually is the very individual who should be in a position to shoot at all times, and who would give up his church or his vote as soon as his shooting.

Although many of the lead bullet rifles are old fashioned coal-burners, or were originally, it has been so long since their chief points have been discussed freely or compared with the high power rifles that it pays to take another look over their score card. They are by no means as dead or obsolete as much of the talk in the magazines during late years would have us believe. In average accuracy a lead bullet will not compare with a jacketed bullet, especially at long range, and yet the scores that may

Five 405-grain slugs from a 45-70 light weight Winchester passed this way during 30 seconds—distance 40 yards. The coal-burners have "a black eye" on general principles, but one overlooks their shortcomings in favor of their effectiveness in the woods. It is refreshing to see so much daylight through a bullet hole after looking at the pin-pricks made by the 22s and 25s so much of late years.

be cracked out at 100, 200, and 500 yards with ammunition largely put together over the kitchen stove and table when necessary, are astonishing. In the woods it is a frank toss-up, from the efficiency standpoint, between the old and the new types of cartridges and rifles, though the newer rifles have other advantages that make them better as a whole so long as they are available.

Take killing power. Whelen, in his wonderful book, "The American Rifle," has this to say: (Page 366)....."sportsmen gradually came of the opinion that such rifles, and particularly the .30-40, exceeded in killing power and of the larger calibers, even the .45-70-500. I cannot say that I personally share this opinion. I have killed many head of game.....in late years with the small caliber, high velocity arms, and have never gotten the large proportion of clean kills that I used to get with the heavy black powder rifles. With these latter rifles the game has dropped so quickly to the shot that I did not see it go down on account of the view being momentarily blotted out by the recoil. In this opinion I am backed up by quite a few sportsmen of extended experience, and particularly by Mr. James N. Kidder of the Boone and Crockett Club, the first sportsman to hunt Alaska brown bear extensively. On these bear Mr. Kidder used both a .30-40 Winchester Model 1895 rifle and a 45-70-405 Winchester Model 1886 rifle. Mr. Kidder's experience was so extensive and so fortunately comparative as to leave no doubt whatever that on large bear the 45-70-405 with a muzzle energy of 1560 foot pounds was a much more killing cartridge than the .30-40 which has a muzzle energy of 1950 foot pounds."

Each of the other lead bullet rifles shares this ability of the .45-70 to drop its proper game. One of the features that helps to make them deadly is that they are

what is often termed "easy to shoot" which means that their balance and hang and conformation make it easy to place their bullets well and do it quickly. The targets printed here show three five-shot groups fired in 30 seconds each. None of them are remarkable for the actual size of the groups, and yet they represent the deadliest kind of woods accuracy.

The old black powder repeaters are easy to shoot. Made with a 32-20 Marlin. Two groups on this target, one made with the sight a notch above the adjustment for the other. Almost any of the bullets would have hit the head of a squirrel, while each group as a whole, represents a kill on anything the string might be fired at. Each group of five shots was fired in 30 seconds at 30 yards.

On game any of the three groups would have meant clean kills. Other advantages are that these bullets are not easily deflected by brush, they usually pass right through the animals hit, and leave blood trails from both sides, they penetrate into the chest cavities and the vitals of heavy animals, and they hog up less meat than high velocity bullets. Altogether the lead bullet rifle is a reserve that no one should scorn to fall back on, though it does lack many of the advantages of the wonderful weapons we are privileged to use when the Germans or the Bolsheviks are not troubling us. If you see some fellow going out after game with a lead bullet rifle, it is safer to avoid betting against him getting what he goes after. Your high power might improve his chances, and yet—well it is wisest to save any pity for some hunter with a returning tale of woes about a fancy gun.

The best of the coal-burners are the .45-70 the .38-55, the .32-40, and the .44-40, .38-40 and .32-20. In addition, for special references, the .25-20, .25-21, .38-56, .40-72 may be chosen occasionally, though the latter two of these rifles will have to be bought second hand. Factories have stopped making them. Some fine light weight repeaters are available for the first seven cartridges named, as well as the regular weights. For instance the .45-70 light weight Winchester Model of 1886 weighs only six and a quarter pounds, and carries on your shoulder all day like a toy, though it shoots about as well as the heavy gun, especially in the brush. The Savage .38-55 and .32-40 featherweight also is another rifle easy to carry. Winchester or Remingtons for the .44-40, .38-40, .32-20 can be secured as light as five or six pounds—thoroughly efficient rifles, too, built for business. In case the shooting will be mainly small game, birds and target, a heavy single shot rifle may be more satisfactory than a repeater. That is the shape the .25-21 should be purchased in.

Certain of the high power rifles intended for nothing but metal cased bullets can be reloaded with powerful lead bullet ammunition that will give clean kills and good accuracy. For instance the 35 Remington, the 35 Winchester, the 33 Winchester, the 405 Winchester and a few others work well even with black powder. The bullet molds to buy are those for bullets without copper gas check cups, although if second molds can be bought for each caliber, they should be the ones for bullets designed to use the gas checks. One wants to be independent of the gas check

cup makers, though in a position to take advantage of their benefits so long as they may be available. The 35 Remington can be loaded with a lead bullet in a way that makes it fully as powerful as the .38-55, and the 405 Winchester can be made to about duplicate the .45-70. If a man really must confine his arsenal to one rifle, it had better be one of this class.

It is a mistake to buy too light a cartridge. The .25-20, for instance, is mighty fine for squirrel shooting and for the trap line, but it is out of place whenever one works on turkeys or the medium and large game animals. A lot of men go after deer with .32-20s that should be ashamed of themselves, as they wound and waste more game than they bring to camp. In this connection it is well to remember that the heavier calibers can be loaded with reduced charges that are very accurate and serviceable. Much has been done of late years in developing reduced charges for high power rifles, and almost as much forgotten about reduced charges formerly perfected for the coal-burners. There is, for instance, the 210 grain bullet for the .45-70, and even the 144 grain collar button bullet for the same rifle, the real worth of which will surprise anyone who has never shot them. It is one thing to use a big caliber rifle whose only voice is a tremendous bellow and that kicks like a steer, and another to have the big noise for the time when it is needed, but at other times to make use of a rather soft "plop" that slings a half-inch section of lead about to where you want it with a recoil that is a mere throb.

To be properly independent of the cartridge factories, one should have several hundred empties on hand, which are kept free from corrosion. A couple of thousand of primers should be kept, which all should be of the smokeless type. These will ignite black powder and smokeless both, while black powder primers will not ignite smokeless unless one loads a good-sized pinch of black powder between the primer and the smokeless. Lead usually is available and cheap at any time. It can be kept on hand or not, as desired. Tin for hardening the bullets (or metal antimony if used) should be kept without fail. Two or three pounds usually is enough for use in several years' supply of bullets.

The powder supply will offer no difficulties. Some black rifle powder should be on hand, but it seldom will be needed. Smokeless powders have been designed of late years for the coal-burners and lead bullets that are

superior, and they should be used in preference to black as long as they can be secured. In most places there is no great amount of trouble getting all one wants of them if he goes about it right. The manufacturers of the powder will help to make its purchase and transportation easy in case local dealers do not have it on hand. The standard smokeless for .25-20, .32-20, .38-40 and .44-40, and for .45-70 lead has been considered Hercules Sharpshooter, and for .32-40, .38-55, the 35 and 405 lead Hercules Lightning. These are absolutely reliable and a can of either goes a long way, though by some they are considered a little hard on the barrels. Du Pont No. 1 and Scheutzen are excellent, though must be kept very dry and will deteriorate quicker than Sharpshooter and Lightning. Du Pont No. 80 is excellent for light and medium loads, but swells the heads of the shells and is otherwise not satisfactory for full power ammunition, in spite of recommendations to the contrary. DuPont No. 18 is used by some in full loads for the larger calibers. Other brands may be on the market before long which will be better than any named. Smokeless ammunition is particularly of advantage over black in the woods on foggy days and during morning and evening, and it is the proper use of smokeless powder that makes a reduced load in big rifle as good as a full power load in a smaller rifle.

The details of loading are given in the handbooks and catalogs better than this article could hope to describe them. Here it is only desirable to mention maximum lead bullet velocity and proper temper or alloy. Soft pure lead makes the most killing missile, every time, yet a little of the softness must be sacrificed to make the lead flow into the molds better and to make it cling to the lands of the rifles stronger. One part tin to thirty of lead is soft enough. If one part tin to twenty of lead is used, or any harder alloy, the bullet will not deform much even when going through bones. The smokeless powder is capable of increasing the speed of the bullets a great deal over black powder, yet the load of it should be kept down to give about the same velocity as black powder gives, or the bullets may fly wild and may strip and lead the barrel. A velocity of 1200 to 1400 feet is very serviceable with a lead

bullet; a velocity of 1600 feet is not. This statement applies to the coal-burners and to the high powers mentioned when loaded with lead.

These suggestions would not be complete without reference to a feature of the 30 caliber, which perhaps are the most numerous of the strictly metal cased bullet rifles. The man who knows how to load them need not lay them away entirely in times of scarcity of the jacketed bullets, so long as Lightning, No. 75 or No. 80 or some better smokeless powder can be secured. One man with a .30-40 rifle regularly uses a reduced load made up of a soft lead bullet (about 1 in 25) weighing about 200 grains and about 11 or 12 grains of No. 75 powder. It is almost a duplicate of the .32-40 black powder cartridge in power, range and accuracy, hence in an emergency is an excellent turkey and small-game load, and is not to be sneezed at for deer and bear. Black powder can not be used with any satisfaction whatever in 30 and 303 caliber high power rifles.

Ease and speed in reloading depend on having the materials and the tools handy. One should have the regular tool with adjustable chamber, and should not overlook proper resizing dies for shells and bullets, shell indenters and the odds and ends of equipment. Their cost is money well spent. The tools and materials should be kept handy, in a box or boxes, as a carpenter keeps his tools. Every few months a batch of bullets can be made. It is then no trick to open the box and to load a dozen or a hundred shells whenever they are needed, while they will be sure to fit into the rifle and to shoot accurately if the tools are used with care.

One can get a lot of shooting for a little bit of money with these rifles. Even the big cartridges cost only a small amount. For instance, 25-20s can be loaded for what 22 long rifle factory ammunition now costs, and the 45-70s, and 38-55s and 405s total only a couple of cents each at the outside. Anyone can afford all he needs of such ammunition. There is solid satisfaction in knowing one has the means under his own roof of shooting for years to come though almost all sources of supply beyond his own sky-line were to fail.

An American Division's Experience With a British Rifle

ALFRED B. GEIKIE

(Formerly Editor of Guns and Ammunition Department)

BACK in the good old U. S. A. once more with an honorable discharge from Uncle Sam's army in my pocket, the writer, who has been in O. D. for three years with the exception of a few months' breathing spell in "civvies" is able to turn his thoughts along old grooves and in my case very pleasant grooves they are. As I explained in a previous article, written while I was at Camp Wadsworth, Spartanburg, South Carolina, with the 108th Infantry, the outbreak of hostilities found us with an entirely inadequate supply of Springfield rifles on our hands and the output even under pressure of war needs equally insufficient for the huge army to be raised. Therefore the majority of the doughboys who left overseas were supplied with the hybrid Enfield, not the true British arm but as I have intimated a "hybrid" no more and no less. A description of the arm is hardly necessary. Most of *Rod and Gun's* readers have seen cuts of the rifle in Mr. E. C. Crossman's excellent article in a former number of *Outers Book*, I believe it was, and my article covered the matter pretty well. Suffice it that the arm had a one-piece stock, one point of excellence over the Lee-Enfield's two-piece stock, Springfield Magazine, Lee-Enfield pistol grip (so-called) and fair rear peep sight not graduated for windage.

The entire 27th New York Division turned in their Springfields and were issued these make-shift military rifles. I remember well the feeling of regret with which I gave my own 1903 up to the supply sergeant. It was a new rifle with a bore shining like a diamond and I had tended to it as though it had been a baby. We were then lined up and issued the Enfields, said rifles were coated with cosmoline and we used up considerable gasoline cleaning them. We drilled with these heavy arms the rest of our stay in Spartanburg and when the division sailed from Newport News, Virginia, in the spring of 1918 the hybrids went with us. After twelve days comparatively smooth sailing and I might add two encounters with subs. and one case of Boche intrigue on board to make things interesting, we arrived at Brest, France.

To make a long story short, we were finally brigaded with the Fourth British Army, Second American Army Corps and again turned in our rifles and were issued the Short .303 Lee-Enfield used by the entire British

forces. The readers are so familiar with this rifle that I will not attempt to describe it. This is simply a lone doughboy's opinion of this rifle as he found it. My rifle was a brand new one. The barrel, after I had removed the heavy grease from the bore, was shiny and beautiful to gaze upon. The stock was open to criticism as to grain and I have already intimated that the misfit pistol grip of the U. S. Enfield did not appeal to me. However, the little arm was all to the velvet when it came to the manual of arms. The little piece snapped up to the right shoulder to "port" and from "port" to the "left shoulder" with a pep that was pleasant. As I remarked in my previous article we carry our rifle when marching at attention with the piece carried at the right and left shoulder, with the arm resting squarely upon the shoulder, not tilted as is the custom in the British forces. The magazine protruding as it does after the fashion of the Remington Auto-Loader and Winchester Model 1895 and also the Self Loaders, gives the arm a rather undesirably insecure feeling when carried "a la doughboy" but with usage this tendency of the rifle to flop over to the British slope became less marked and we began to rather admire the little arm for its lightness, handiness in performing the manual and ease of removing the bolt for cleaning.

On the range the arm showed fine accuracy though handicapped by inferior sights. In rapid fire, I was usually out of the running as my rifle must have had Mr. Crossman's "Jinx" along as it jammed devilishly usually on the fourth or fifth shell from the magazine. In fairness I may say that this trouble was not so apparent when using but one clip of five shells, it was when using the two clips with one cartridge in the chamber that the trouble was greatest. The recoil of this rifle was not in the least troublesome as we still retained our old slings in preference to the web sling issued with the British rifle. In rapid fire I usually "borrowed" a rifle belonging to one of our cooks. The tendency of this rifle to jam was not so marked though it too would "show off" occasionally. This jamming tendency is not present with either our Springfield or Enfield, from now on to avoid confusion I will refer to the later arm as the Model 1917.

In the lines I found sand or dirt a source of annoyance as the action would jam if the

action were not kept absolutely free from Flanders mud and I leave it to you fellows who have been in the lines before Mount Kemmel whether it was an easy job to always do this. At the Hindenburg Line, September 29th, just before going over the top which we did behind tanks, I was knocked down by the wind of a shell which burst close by on the opposite side of the trench. My rifle of course fell from my hand and though I did not at the time notice it some dirt managed to work its way into the action. A few minutes more we went over and it seemed as though every machine gunner and artilleryman in the German army were trying to annihilate L Company of the 108th though of course other companies on our right and left were catching it as badly. German planes flew overhead bombing us and being engaged by allied planes. A squad of Yankee doughboys actually brought a Boche machine down with the rifle. We steadily advanced, rifles slung over our shoulders, bayonets fixed. The fire became so hot, the advancing line was forced to flop in the old Yankee way on the belly for a respite from the scathing fire. It was not far from the Hindenburg line after hitting the dirt and placing our Lewis gun that a machine gun bullet caught me through the foot as a result of which I limp today. Here where I had a chance to use my rifle the all-cussed little brute refused to operate and there out in No Man's Land, I swore off anything but fool-proof, dirt-proof, rust-proof and doughboy-proof rifles. To make a long story short, the Division gained its objective at heavy cost. For the benefit of overseas men who saw the country with the C. E. F. I would say our objective was mid-way between Cambrai and St. Quentin.

These rifles of course were chambered for the regular .303 British ammunition. The fact that the 29th New York Division was with the British and not in close contact with the American troops holding their own fronts made it necessary for us to use this rifle and ammunition. On the American sector proper the Springfields and Model 1917 rifles were used with excellent results. The Springfield made good on all occasions and the only complaint regarding the 1917 was its weight which seems excessive for a military arm. The short Lee-Enfield would make an ideal cavalry arm as regards weight and length. The magazine system as it stands today from my somewhat limited experience with the piece I would say is decidedly inferior to the Springfield system while this rifle's lightweight and shortness makes it popular with the doughboy who must needs carry it for many a weary kilometer in all kinds of weather.

Those days I am thankful to say are a thing of the past, not that I regret the experience nor the fact that at the time of my country's need I volunteered, but any returned soldier who reads this will agree with me when I say it is not the bullets and shrapnel music which is always the hardest to bear. The cold, the exposure, the hikes, all these tend to make war what Sherman justly called it, and our Sherman was never in the trenches at Albert, East Poperinghe or Dickebusch where we spent days and nights of hell.

The old 27th Division is now only a memory mustered out of the United States service but if praise from such men as Pershing, Haig, Rawlinson, Gellibrand, etc., carry any weight, it is a fact that the record of this division on Service was an enviable one.

Rifle and Revolver Dope

J. E. HENRY

I notice that some of the readers of this department are interested in the use of "Spitzer" (pointed) bullets in the .30-30 class of cartridges, and especially in the Model 99 Savage rifle, as they can be used in the magazine of this gun. Therefore the writer believes it would not be amiss to state what can be done with "Spitzers" and other "lighter than standard" bullets in these, as well as some of the more powerful cartridges.

In the .25-35 Savage the 87 gr. Spitzer bullet (as used in the .250 Savage) can be

loaded to a muzzle velocity of 2850 f.s., which far out-classes the .22 High Power, and as a killer is about equal to the .250 Savage. This is on account of the bullet not flying to pieces so readily but penetrating much deeper, which is due to the lower velocity. The small amount of drift to the right will not be noticed at deer shooting ranges, and for target shooting it can be corrected by the wind gauge.

The 86 gr. metal cased bullets (as used in the .25-20 Cartridge) can be used in the .25-35 and .25-36 at a muzzle velocity of 2575 f.s.

That is about the limit for these bullets as the jackets are not strong enough for higher velocities.

Now here is a little warning. Maybe the reader has noticed that the Editor of another magazine has been freely recommending a charge of 25 grs. Hercules Lightning Powder with the 86 gr. M. C. bullet for the use in the .25-35 cartridge. The writer had the Hercules Powder Company test this charge, with the result that pressures went high, yes, 55,000 lbs. per sq. inch for the first shot. Needless to say the charge was reduced right there to 22 grs. which gave an average pressure on 10 shots of 37,910 lbs. with a maximum individual pressure of 43,200 lbs. with an average velocity for 10 shots at 53 feet from the muzzle of 2524 f. s.

Now for constant use it is not advisable to use a pressure much above 39,000 lbs. in the Model '94 Winchester and the Model '93 Marlin. Therefore if the reader happens to be using this 25 gr. Lightning charge, it is advisable to drop it to 22 grs. or he can use 28 grs. Dupont Improved Military Rifle Powder No. 16, which will give you 2575 f. s. with a pressure of 37,540 lbs. per sq. inch. These same 86 gr. soft point bullets are fine for reloading your fired shells. Fill the shell with Dupont No. 1 Rifle or 17 grs. Sporting Rifle No. 80. Yes, if you can shoot at all, these reloads will stop that mowitch very nicely.

There has been much interest displayed in having the .25 Remington Auto Loader chambered for the .250 Savage cartridge. This means considerable expense, and does not alter that 10 inch twist, and the .250 Savage cartridge develops a pressure of 50,000 lbs. for which the Auto Loader was never intended.

The simplest way to get that coveted .250 Automatic is to use the 87 gr. Savage bullet in the .25 Remington shell and speed it up to 3000 f. s. Yes, it can be done.

I am not giving these extreme velocity charges, as it may lead to a case of "shrapnel in the dome" of some of the inexperienced who may attempt to load them.

The .250 Savage can be speeded up to 3250 f. s., and the .280 Ross to 3,300 f. s. The 7MM 143 gr. expanding Spitzer can be pushed very close to 3,000 f. s.

The .30-30 and .303 Savage can be loaded with the 150 gr. expanding Spitzer to 2500 f. s. and they will work through the Savage magazine, but be careful, don't monkey here, as these charges were primarily intended by the DuPont People for single shot purposes.

.30-30's can be carried in the chamber for the first shot followed by the standard 170 gr. bullet at 2275 f. s.

The writer personally considers the .32 Special as the best game killing cartridge in the .30-30 class, and when that flat nose 170 gr. bullet is speeded up to 2275 f. s., it does fearful execution, but when loaded to 2400 f. s. it is one of the very best cartridges for "short range in the woods" that we have to-day bar none.

There is a 140 gr. expanding Spitzer for the 6.5 MM Mannlicher, which can be pushed along at 2700 f. s. In speaking of the .30-40 and Springfield cartridges, did the question ever rise in your mind as to why the American Government went to the trouble of designing the Springfield cartridges when the same ballistics were obtainable in the .30-40 or Krag cartridge with much lower pressures, with the same brand of powder, and about 4½ grains less of it, which means considerable powder economy when millions of cartridges are loaded in war time.

The difference in weight of powder charge, and in the Krag and Springfield cases are factors to be considered when cartridges by the hundreds of thousands are to be transported over rough roads at the front. Maybe some of the American Military men could throw some light on this question.

The .30-40 will handle the 150 gr. Spitzer up to 2825 f. s. and the 175 gr. Newton bullet at 2500 f. s. The .30-1906 will push the 150 gr. bullet up to 3000 f. s. and the Newton bullet at 2730 f. s. There are some special bullets which can be used in some cases in the 8 and 9 M M which far exceed the factory loading in velocity. There is a 175 gr. soft point Spitzer that can be used in the .303 British, and when loaded to the same velocity as the Mark VII ammunition makes a nice hunting load. In the .303 Ross this same bullet can be speeded close to 2600 f. s. The 195 soft nose bullet (as used in the .303 Savage) can be loaded in the .303 Ross to 2580 f. s. Of course, the crimp groove is some distance out of the shell, and is not very pleasing to the eye, but it is powerful medicine, and one pill is sufficient for that charging bull moose. There is a 200 gr. copper jacket bullet that can be used in the .35 Ross and Winchester. Model 95, the charge has not yet been chronographed, but the velocity exceeds 2500 f. s. The .33 Winchester can be speeded up to 2350 f. s. and the .35 Remington to 2225 f. s. Now I suppose somebody will want to speed up the "fat man" to 2500 f. s. 45.00.200 to 2250

f. s. and it shoots fine in the 20 inch twist of the '95 Marlin, but if it "must" be an '86 Winchester then buy the .45-70 and have it chambered for the .45-90 cartridge and you get the 20 inch twist, with the more powerful cartridge, and accuracy equal to the .45-70.

Did I hear somebody say .405? Nothing doing! Better get a 12 inch Naval gun, weight 53 tons, length 44.5 feet, bullet Spitzer, 42 inches long, 870 lbs. powder, 310 lbs. (No, it's not "Bulls Eye" or "Pistol No. 3") muzzle velocity 2700 f. s. If this is not power enough ask Newton to build you something special.

By the way, we are going to have some new Bolt Actions soon, of Winchester, Savage, and Remington make. The Savage People will discontinue their model 1899 rifle in .25-35, .32-40 and 38-55 calibers. The Winchester Company will drop the Single Shot falling block model and also the '86 Model in

all calibers but .33. Mr. Charles Newton is going to give us some new guns, one of which is a .22 caliber repeating pistol, which uses a 70 gr. bullet at 2,000 f. s. that should be "some gun."

Guess there are some users of the revolver who are interested in speed too. Well, there is not much doing with the ordinary revolver, but that "Single Action Army" and "Bisley Model" Colt in .32-20 and .38 Special calibers are vastly different than the ordinary six shooter. Using the regular 100 gr. M. C. bullet in the .32-20 and the 130 gr. M. C. bullet (38 Auto Colt) in the .38 Special they can be speeded close to 1400 f. s. which will give striking energy equal to the .38-40, .44-40 and .45 Colt factory Cartridges, and with about half their recoil. You have the advantage of the flatter trajectory, and the higher velocity gives more shock to animal tissue, consequently they equal the big calibers in killing power. Nuff Sed!

Another .22 Bolt Action

FRANK ELWELL

(Reprinted from *The Arms and The Man*)

A RECENT issue of *The Arms and The Man* commented editorially on the .22 caliber bolt action, and made the statement that the time was ripe for the development of such an arm.

A couple of years ago the writer conceived the idea of remodeling a Springfield 1903 by putting on a barrel chambered for 22-15-60 center-fire Stevens ammunition. We are giving you a photograph of this gun, the story of which is about like this—

A model 1903 Springfield was purchased from a neighbor boy for \$1.00. The gun had gone through the Dayton flood of 1913 and

as a useful gun, it looked like a total wreck. The object in buying the gun was to cut down the stock, which was badly warped and split, to get patterns from which to remodel the stock of my military Springfield to a sporting stock. After some of the rust was removed and the mud sandpapered off it developed that the gun had considerable possibilities yet, and the more it was manicured the more enthusiastic the manicurist became.

Finally it was decided that on account of the history of the gun, it having survived the flood, it would be a good proposition as a souvenir. This necessitated fixing up the

stock by putting in a plug here and a Dutchman there to stop the cracks, and a block of wood back of the trigger guard to be cut down as a pistol grip, the comb to be built up and various other wood surgery stunts, such as checking, to be accomplished. This was done quite to the owner's satisfaction.

Then the action of the gun was cleaned up, polished and reblued and found to be in excellent working condition. The next thing was the barrel. We have two local gun sharks, who bore out barrels, put in a tube and re-rifle them, and strange to relate each of them modestly admits that the other is the better workman of the two. One of said sharks put in a nickel steel tube in my barrel, rebored it for .22 with a twist of 1 in 12 and chambered the breach for 22-15-60.

Then came the ammunition. The factory ammunition did not group its shots quite as well as an ordinary sling shot. If we had not had quite as much confidence in the gunsmith we would have been inclined to blame the barrel, but decided to stay with it a while before doing so at least. Bullet moulds and re-loading equipment were secured. A number of bullet swages were made for sizing and swaging the bullets, and we started out with a program as follows:

Bullets would be made of pure lead, of 30 lead to 1 of tin, 20 to 1, and 10 to 1. Then of each mixture some bullets would be used as cast, some sized to .228, some to .227, also, two diameter bullets (a la Dr. Mann) and bore diameter bullets. Each of these mixtures and sizes would be tried out with King's semi-smokeless powder. Du Pont No. 80, No. 1, No. 18 and No. 21 and 75, Schutzen and several others. The program as mapped out was not followed entirely but wherever a promising lead appeared it was followed to the bitter end.

At first, charges of powder recommended by the manufacturers were used, careful measuring done with the powder measure, and in some cases the charges were weighed. Groups obtained averaged anywhere from 2

to 10 inches in diameter, at 100 yards, some of which were encouraging and some were not. We have now found a load which will give 2-inch groups at 100 yards. We have even gotten one or two lucky 1½-inch groups. The best bullet mixture seemed to be 10 to 1 and we are sizing our bullets all to .22.

This test shooting was done with muzzle and elbow rest and telescope sight to eliminate the personal equation as far as possible. We have about completed our experimental work with the gun and believe we have worked up a gun and load which will be fine as a semi-sporting rifle to knock over crows and ground hogs at unknown distances up to 100 yards.

Some difficulties have developed in making the gun a repeater. At present it is working as a single shot. We have some patterns made up and believe we will be able to cut down the magazine so that the gun will function properly and repeat for at least two or three shots. If any company manufacturing reloading tools gets into shape to take care of the trade, we hope to continue some experiments with a barrel on a Springfield action chambered for Savage 250-3000 shell. It appears that this ammunition will function in the Springfield action without alterations and this gives opportunity for unlimited experimenting because of range of weights and types of .25 calibre bullet available from 25-30 up to 25-35 in lead, gas check and metal patched.

We understand that one or two of the big gun manufacturers are going to bring out bolt action rifles and one is already taking orders for a .22-bolt action which looks good. We do believe that to be a success as a target gun as well as an outside gun, the .22 as well as any other calibre must be a real gun in weight and strength, with a heavy barrel nearly straight instead of tapered to small diameter at the end.

If any of the other cranks have had any similar experiences we would like to hear their discussion.

Queries and Answers

The .25-20 Winchester

Editor, Guns & Ammunition Dept.

I would like a little information regarding the reloading of shells for the .25-20 model 1893 Winchester rifle.

Where can I get black powder primers and

Would 17 grains of F. F. G. black powder be a satisfactory load for this cartridge and where can I get this powder?

What is the proper portions of lead and tin for the .25-20 bullet? Why is a pure lead bullet not used? (Because it is too soft. Ed.)

have asked the publishers but they have no more in stock.

One more question and I will close. Is there any difference between the shooting qualities of the 6 and 8 inch type Stevens pistol?

A Reader.

Brantford, Ont.

Reply.—For the loading of the .25-20 Winchester cartridge in U. M. C. shells use the No. 1 U. M. C. Primer. Your load of 17 grains F. F. G. black powder would be perfectly satisfactory for use in this cartridge. Either the Sales Department of the Hercules Powder Company, Wilmington, Delaware or the Rifle Smokeless Division of the E. I. Du Pont De Nemours Company, Wilmington, Delaware can supply you with F. F. G. black rifle powder. For the .25-20 using black powder, cast your bullets about one part tin to 30 or 40 parts of lead.

I do not know where you could secure a copy of the Ideal Hand-book; if you cannot secure one from the Ideal Manufacturing Company.

In regard to the difference between shooting qualities of the Stevens pistol with 6 and 8 inch barrels, the 8 inch barrel will prove the more accurate.—Editor.

Editor, Guns & Ammunition Dept.

What rifles are the best to have, for small and large game shooting?

In January issue, W. A. Mason stated that small bore, high power rifles were not suitable for large game, having stated that many hunters have followed the blood trails for days, and not getting their game.

What would you suggest as a proper rifle? I would prefer a Savage .250 for deer, .35 Remington Automatic for moose and a .256 Newton also for moose.

Hoping you will pick the most suitable, all round rifle for Moose, Bear, Deer, out of the following and if yours is not included, please let me know as soon as there is room in your valuable magazine.

.22 H. Power Savage.

.250-3000 H. Power Savage.

.303 Savage.

.30-30 Winchester or Rem.

.35 Remington Auto.

.256 Newton.

What do you think about .32 Colt Auto for belt gun when on trap line?

Thanking you in advance, I remain,

Yours,

W. J. V.

Toronto.

Reply.—I would select the .35 Remington or the .256 Newton for Moose and the .250-3000 or .256 for deer out of those you have named.

I would prefer a .22 S. & W. pistol or a .22 Colt Auto to the .32 Colt Auto for a trap live sidearm.—Editor.

The Shotgun on Woodchucks.

Editor, Guns & Ammunition Dept.

My May copy arrived today, and I looked it over tonight. I read the article on "Woodchucks" first, as these are animals everyone around here are very familiar with. Some farms are alive with these little animals and, no doubt, the proprietors would give quite a lot to get rid of them. However, if they would spend a few evenings in May or June shooting them, they would soon clear them out. I shot sixty-five last summer on my own place with sixty-five shots and only one was able to get in his burrow. The whole thing is to have a little patience, a good gun, and ammunition. My gun is a full choke Model 10 A Remington Pump Gun, 12 gauge, and the best load I have found for woodchucks is 25 grs. Ballistite, 1¼ oz. of 7½ chilled shot. At 30 yards with this outfit, it's a poor shooter that allows any groundhog to escape.

If the groundhog has its burrow around the face of a hill, any kind of a hunter can get within 30 yards before the groundhog will discover him, and I have on different occasions got within 10 feet before Mr. Woodchuck saw me. If you happen to strike a wise old woodchuck out in a big open field where he can see you coming, take off your hat, put the gun to your shoulder, and covering the groundhog advance till you are within range. If the groundhog has never been shot at, he will very seldom retreat below ground till you are twenty yards from him. However, if he does walk up near his burrow, sit down, and covering the mouth of the burrow you will only have to wait a few minutes till he will appear. Of course, you want to sit still and continually watch the hole, or he may show his head and seeing you, get back before you know he has seen you.

I have a neighbor near me who has a 20 acre sand field on his place, and I think on that 20 acre field there were 200 woodchucks. We had been shooting at them with a .303 Savage Carbine, but didn't hurt them much. Then he tried a shotgun loaded with buckshot with not much luck. He laughed at me when I told him to use 7½ shot. So to prove to him one day at noon we went back, I took my gun and I walked across 40 rods and back, and

with 18 shots I killed 17 right where they stood and the other one was hit hard, as we could hear him gasping for breath in the hole. I got twelve on my place this year, and I am glad to say I have not noticed any more around for three weeks. Though my neighbors have so many, I expect an odd one along now and then.

Perhaps this letter will help some other farmer to get rid of these chaps who do so much damage to our crops, and at the same time afford them a fine evening's sport.

C. V. B. McRitchie.

Muirkirk, Ontario.

A Few Hours Crow Shooting.

So much has been written about crow shooting in your magazine, that I hope you will permit me to relate some experiences I had with this kind of sport.

During the month of October 1915 I was domiciled on a farm about 3 miles from the St. Lawrence river.

I had plenty of time on my hands for the first 3 or 4 days, until I secured my favorite companion, my double barreled hammerless shot gun, and a good supply of shells loaded with No. 4 and 5 shot.

There were large numbers of crows in this vicinity, but they were very wild. Perhaps you have seen the autumn flight of crows, which usually starts about 10 o'clock each day and continues until dusk. They all seem to travel in the same direction and it is my opinion that they congregate in some large swamp where it would be warm during the night. It seemed to me a pity not to be able to have any sport, when there were so many of them around, but they would be out of range when flying over fields or cleared land. So I thought of another plan for securing good shooting.

Selecting a small thickly-wooded maple grove right in the line of flight, I walked into the grove about 100 yards and found an opening about 20 yards in diameter, where I could plainly see them flying over. I had not waited long when a large one flew over and a quick shot brought it down with a broken wing. This bird was immediately retrieved and I tied a stone to his leg to act as an anchor.

Crows do not like to see one of their number in distress and when I placed this one in the open field at the edge of the grove, I waited for them. When they came over the edge I had plenty of shooting.

As soon as they sighted the decoy they would call and receiving no answer, they

would circle back over my head and I will say that I had some splendid sport.

When the time arrived for me to leave for the house, for early supper, I counted 19 crows that would never pull up any more farmer's corn, nor kill any more beautiful song birds, nor rob any more nests.

The next afternoon I killed eight more. My reason for telling this is that it may help some shot gun enthusiast to rid us of a few more of these nuisances as well as provide a means of securing some splendid wing shooting.

A Scatter Gun Enthusiast.

Information on the .303 Savage.

Editor, Guns & Ammunition Dept.

I would like some information on the .303 Savage. Is this rifle heavy enough for moose?

Is there any difference in the accuracy and speed of the feather weight model and the regular rifle?

Would you kindly give me the trajectory and velocity of this cartridge?

A Reader.

Detroit, Mich.

Reply.—You will find the .303 Savage a very satisfactory big game rifle. Mr. W. G. C. Manson, Lillooet, B. C. used this rifle for many years for big game hunting and upon one occasion he was reported to have killed 18 head of large game with 20 cartridges. This included two grizzlies.

The muzzle velocity of this cartridge is 1950 ft. per second, and the muzzle energy is 1650 foot pounds. The 200 yard trajectory height is 6 inches and the 300 yard trajectory height is 16 inches.—Editor.

The .303 Ross Rifle.

Editor, Guns & Ammunition Dept.

Would you mind giving me a few tips on the .303 Ross rifle? What I wish to know is;

1. Will it use the .303 British cartridge, as I have heard that the rifle is chambered only for their make of .303 Ross cartridges? Can you tell me positively whether it does or not?

2. Will the magazine feed properly? A couple of years ago, I owned one Army Ross rifle and the magazine of same would not function properly, about one shell would come up, out of ten.

3. Do they put out different grades of .303 rifles, and if so, which is the best model, I mean which will stand the tear and wear best?

I use a .30-1906 and use only the 220 grain bullet, in it which gives 2198 F. S. and that is plenty good enough for me.

P.S.—I read once in *Rod and Gun*, I believe,

an article about the reloading of the .30-1906. The party in question was complaining that the shells could not be made to fit again, on account of stretching, after being fired in a Winchester rifle. I have never reloaded one myself. Is this true? Have you ever seen or used a bullet like this:

I did in the old country. I think they do more damage than a soft point. If they strike a bone or any hard substance the steel point keeps driving, but the lead part of the bullet deforms and mushrooms itself something awful. I have seen deer shot with it, through and through, and believe me, where the bullet came out, it made a hole bigger than your two fists. The rifle using those was a Mauser straight pull 7.50 m.m. If you have any facility in making bullets, do try some, you would be surprised at the result. These bullets are like those of the 220 gr. .30-1906 cartridge.

E. B. Cornaz,
Glenora Park.

Brockville, Ont.

Reply.—In reply to your request, the .303 Ross Rifle uses the .303 British Cartridge.

The Winchester Repeating Arms Company, the Dominion Cartridge Company, and the various other Cartridges Companies make this ammunition.

In answer to your second question, I have not heard of any trouble in regard to the proper feeding of the cartridges from magazine to the barrel.

In answer to your third question, the Ross Rifle Company put out several grades of .303 Rifles, the best one of which had a checkered stock with full pistol grip, but I do not remember what the model number was, and do not have the Ross Rifle catalog at hand as this letter is being answered.

In regard to the difficulty of reloading shells, that were shot in the model 1895, .30-1906 Rifle catching in the chamber. This is due to the fact that the action of this rifle is such that the shells stretch sufficiently in firing to cause this difficulty. This trouble is found in the Lever Action Rifles, that use high intensity cartridges. It is not found in Bolt Action Rifles.

I have not used the type of bullet that you

speak of, but I do not see how this bullet could be used satisfactorily in the high power rifles, for a full charge load, as apparently the base of the bullet is lead, which precludes the use of this bullet at velocities in excess of about 1550 foot seconds, due to gas cutting.

I suppose that the bullet you mention was used in the large caliber low velocity rifles.—Editor.

Cleaning a .30-30.

Editor, Guns & Ammunition Dept.

I own a .30-30 Winchester Carbine, model 1894; and if I clean it I will have to clean it from the muzzle, or, I will have to remove the breach-block. Is it easily removed? I have a Marble's brass rod and would it be safe to clean the rifle from the muzzle with it?

Does a pull-through clean a rifle as well as a cleaning rod? When cleaning a rifle, is it all right to use the wire brush? Is it all right to use ammonia when cleaning a .30-30 Winchester Carbine?

Thanking you for your information.

Yours truly,
Vivian Bartram, Jr.,

10 Lonsdale Road, Toronto, Canada.

Reply.—In reply to your request, you will have no trouble in cleaning your rifle from the muzzle, if you use a brass rod.

A pull-through does not clean a rifle as well as a regular cleaning rod. You will not injure the rifle by using a brass cleaning brush. To use ammonia in cleaning your rifle you will need to use a steel rod instead of a brass rod.

You can secure very good results in cleaning the .30-30 rifles by using "Hoppe's number 9" Marble's Nitro Solvent Oil, "Winchester Crystal Cleaner," or some other similar preparation.

I would not recommend that you would try to remove the breech-block from your rifle. In cleaning rifles of this type, these Nitro cleaning fluids will do practically as good work as ammonia. However, you will need to clean the rifle for two or three days in succession to keep it in perfect condition. Editor.

The Hill Revolver.

Editor, Guns & Ammunition Dept.

Is the Hill Revolver an (English made weapon) with a three inch barrel, an accurate fire arm?

Donald Laing.

Reply.—I have never heard any reports concerning this weapon.—Editor.

The 7.65 M. M. Mauser.

Editor, Guns & Ammunition Dept.

I appreciated the answers you gave me sometime ago in regard to the .250-3000 Savage, so I thought I would ask your opinion about the 7.65 M. M. Mauser Rifle.

I desire to know the weight of the bullet, the trajectory height, the velocity, and the striking energy of this cartridge, and its recoil as it compares to the .35 caliber Remington.

What is the weight of the rifle, where can it be purchased, and what would it cost and what is your opinion of it as a big game rifle?

I do quite a lot of coyote shooting, and have been using a .30-30 Winchester, but the trajectory is too high for shooting over unknown ranges. Then I tried the .250-3000, but for some reason it does not always shoot to the same place. Sometimes it shoots higher than it does at others, and that rather destroys a man's confidence, when one tries for two hours to get a shot at a coyote, and then puts the bullet over him, when it should have gone through him. To say the least it is hard to look pleasant for a couple of days thereafter.

E. S. Meiklejohn,

Wilkie, Sask.

Reply.—In reply to your inquiry the 7.65 M. M. Mauser is loaded in several ways. It is loaded with a 154 grain metal cased Spitzer bullet, that gives a muzzle velocity of 2790 foot seconds and a muzzle energy of 2660 foot pounds. The 200 yard trajectory height is 2¾ inches and the 500 yard trajectory is 21 inches, which is less than Springfield. This cartridge is also loaded with a soft point round nose bullet weighing 216 grains which has a muzzle velocity of 1980 foot seconds, and a muzzle energy of 1877 foot pounds. It has a 200 yard trajectory height of 5¾ inches and a 500 yard trajectory height of 53 inches.

Both of these cartridges are more powerful than the .35 Remington, and the longer the range, the greater the difference becomes.

To obtain the 7.65 M. M. Mauser, I would suggest that you try Schoverling, Daly & Gales, Broadway, New York City, and Abercrombie & Fitch, New York City, who may be able to supply this rifle. This weapon with the Spitzer load will certainly take care of your coyote shooting. The reason that your Savage does not shoot consistently is mostly because it is a take down rifle and taking it apart and putting it together, would naturally change the sighting somewhat.

Any rifle will show a daily variation in elevation, but the high power rifles will show less than the low power ones.

If you screw it up tightly and don't take it apart in cleaning, you will find that your elevations will remain more constant.—Editor.

.22 Caliber Center Fire Rifles.

Editor, Guns & Ammunition Dept.

In beginning my letter to you, I wish to express my appreciation of your excellent magazine. It certainly contains more for the man who loves his rifle than any other publication that I have seen.

Will you kindly give me some information on the .22 Caliber center fire low power cartridges? How do they compare in accuracy to rim fire .22's at ranges under 125 yards, and to the .25-20 and the .25-21 at ranges over 125 yards. Would a Maxim silencer affect their accuracy? Are they hard to re-load?

I hope you will advertise any books you have for sale. I buy any books I can on shooting.

James Askew,

Georgetown, Ky.

Reply.—The two rifles that you refer to are the .22-13-45 Winchester, single shot, and the .22-15-60 Stevens. These cartridges are slightly harder to re-load than the .25 calibers, as the bullets are harder to make exactly round, as they are smaller. They are not generally considered to be as accurate as the .22 rim fire rifles, but possibly this is due to the fact that very little attention has been paid to these two calibers in late years, since the later smokeless powders have been developed. They are both splendid small game cartridges, and are better for small game shooting, than any of the rim fire cartridges, due to their flatter trajectory and greater striking energy.

The Maxim silencer would not affect the accuracy of the rifle if it was put on correctly and kept clean, but it would not entirely eliminate the noise of the discharge, as the bullet leaves the barrel at greater velocity than the velocity of sound.

The American Rifle, by Lieut. Col. Townsend Whelen, is the best book on rifle shooting that is published. It is for sale by W. J. Taylor, Ltd. Woodstock, Ontario, (publishers of this magazine) at the price of \$5.00.—Editor.

Various Answers.

Editor, Guns & Ammunition Dept.

I have a Marlin Model 1893, .38-55 Cal. Rifle with a Special Smokeless Steel Barrel, 26 inches long. Could this barrel be cut off to 23 or 24 inches in length, and who could do this for me in Ontario?

How would a sight be attached to this cut-

off barrel? Would a band sight like the Newton be put on or would a slot be filed? Could a regular steel sight be inserted? Could this work be done by someone who is not a gunsmith?

Would this rifle with Lyman peep and Vickers Maxim front sight be satisfactory?

Is this rifle powerful enough for moose if it is shot with high power cartridges?

How could a Ross Military Rifle be remodeled to a sporting rifle? Would these military sights be satisfactory for hunting? How could this rifle be cleaned of nickle fouling?

Is Camp Perry Rifle Paste that is advertised by P. J. O'Hare, 33 Bruce St., Newark, N. J. as good to remove nickle fouling as is ammonia? If not what would I use to remove nickle fouling?

Is it safe to use the .303 Savage Cartridge in a rifle chambered for the .303 British? When they shoot, they burst around the neck. Is the resulting accuracy good?

What is the .35 Ross Rifle like in power? I have seen it mentioned in an old number of *Rod and Gun*.

Where and at what price may Col. Whelen's Book "The American Rifle" be purchased?

Are the U. S. Cartridge Company's, "N. R. A. Cartridges" accurate up to 250 yards?

J. L. K.

Reply.—You could have this rifle cut off to 22 or 24 inches but I would not advise you to try it as you will spoil the balance of the rifle. Mr. James Brock, London, Ont. can do this work for you. He would very likely attach the front sight by filing a slot in the barrel and attaching the sight the same way as the present sight is attached.

Lyman peep and Vickers Maxim front sights would make a very good set of hunting and target sights.

This rifle is powerful enough for moose at short range.

I have never seen a remodeled Ross Military Rifle but do not see why it cannot be remodeled. You would require a new front sight and you should also have a new rear sight. For removal of nickle fouling from a high power rifle, the best method is the use of the ammonia metal fouling solution. To do this take a fired shell, plug the mouth of the shell with a rubber cork. Place the shell in the chamber and close the breech. Place two or three inches of rubber hose over the

muzzle. Let the steel cleaning rod down the barrel on to the cork. Then pour your barrel full of ammonia fouling solution. Allow it to stand in the barrel about 20 minutes and then pour it out and dry the barrel and oil it. This will remove the nickle fouling. You can also remove most of it by scrubbing the barrel with Camp Perry Rifle Paste or Motte's Paste or with Hoppe's No. 9 and a brass brush.

It is not satisfactory to use a .303 Savage Cartridge in a rifle chambered for a .303 British Cartridge.

The .35 Cal. Ross Rifle shoots the .35-250 Cal. Cartridge that is used in the Model 1895 Winchester Rifle.

Col. Whelen's Book may be secured from Mr. W. J. Taylor, Ltd., Woodstock, Ont. at the price of \$5.00.

U. S. Cartridge Company's N. R. A. .22 Cal. long rifle cartridges are fairly accurate at 250 yards if there is no wind blowing and if they are shot out of a very accurate rifle. This is also true of the more accurate batches of .22 Cal. long rifle Cal. Cartridges, manufactured by the other concerns.

Editor, Guns & Ammunition Dept.

Comparisons.

Editor Guns & Ammunition Dept.

I note in several issues of *Rod and Gun* that you recommend the .33 Winchester as being a very good moose and deer rifle, and I would like to ask a few questions about this rifle. Could Ammunition be readily obtained for it?

Is the recoil as heavy or heavier, than the .32 Special or the .303 Savage, and how does it compare in accuracy with these two cartridges?

Which sights would be the best for use on the .32 Special for hunting?

J. Broult.

Reply.—The .33 Winchester has slightly more recoil than the other two rifles. However, it handles better than either one of the others. I consider that it has the best action placed on the lever action rifles. It balances perfectly and the trigger pull is splendid. Of the other cartridges, I would consider the .303 Savage as being slightly more accurate than the other two but there is very little difference. The three are very fine rifles.

My choice of sights for the .32 Special would be a No. 1A Lyman peep sight and a medium sized gold bead front. —Editor.

F. V. WILLIAMS

THE first frosts had come and with them the glorious tints of autumn. Everywhere the blaze of color was a picture that held the eye of even the pleasure satiated party up at the old camp. No taste had they for the long trail and the scattered shots that were to be had at the few partridge about this season.

The man of the party plainly told the guide—much to that chap's disgust—that he had at least expected

to get his full number, all the law allowed—when he went out after ruffed grouse.

To break even, the guide had remarked that he surely ought to get all that came within sight, judging from the size of the artillery the gentleman carried, referring to the big twelve gauge automatic that the man from the city was using.

A walk of five miles over the trail with but three shots at partridge

settled the question as far as the man was concerned. He would take no more tramps like that. The place had been misrepresented to him. He didn't believe there ever had been birds in that particular section and when the guide had respectfully suggested that they try for some of the big muskinonge or bass, he met with a grouchy refusal.

As the gentleman said, the fishing was probably as bad as the hunting and he gave it up without a trial and for the next few days this man sat around camp pooh-poohing everything connected with it, varying this form of amusement by sitting on the veranda of the dining house smoking black cigars and dreaming of the gay cabarets and midnight carousals that he had left behind in town. The others in the camp noticing his state of mind gradually left him to himself so much that he finally decided on getting even with the 'whole outfit' and the next morning after making this decision he struck out after breakfast and walked seven miles over a much worse road than he had hunted over, to a place where they kept 'loggers whisky.'

Now this gentleman was accustomed to good whisky, also various other forms of 'joy water,' and in the city you could not have paid him to drink a glass of this stuff that had been made to jolt the sensibilities of the husky loggers, when they came to town for their monthly spree. However, this was all there was to be had and he purchased two pint flasks and departed. Even the proprietor smiled to himself as he saw the gentleman "legging it" back toward camp without so much as taking a drink at the bar, and wondered what the game was.

Not a drop did the gentleman touch that day. He arrived at camp late in the afternoon, sat around as usual and scowled at everybody that came near him. The ladies of his party went away for the afternoon, with some others from a nearby camp on a little canoeing excursion and when they came back the grouchy one had gone to bed.

The dawn of another day saw him

flying about with an energy that made the early risers about the camp wonder what had come over him. Now in his loafing about the camp he had heard of 'The Big Drummer' the wise old partridge that had fooled the dog and his master last season, that you read of in *Rod and Gun* 1918?"

Now he, the man with more money than any of these other fellows in camp, more money than any two of them, yes, any three of them put together, why he could buy out the whole place, and this sentimental bunch of wood lovers who came up here season after season "just to be in the woods." He grinned to himself as he took in the landscape from the front of the little log cabin he occupied with his party.

There was the lake, and yes, there was lots of trees with yellow and red leaves on them. There was also some green trees "Christmas Trees" as he had heard one of his witty lady friends remark one time in looking at a famous painting that was attracting more attention than herself at an art exhibit. How astonished some of the people looked as they heard the remark, and how this "splendid girl" had turned to him and asked so innocently "Are all the trees up in Canada Christmas Trees, like those in the painting?" Really, it was the smartest thing he had heard at the exhibit. If she were only here now! Well things would be different, they'd just take the first train back to town and let this camping business go hang and they'd have a 'real time.' Bah! that mist rising off the lake disgusted him. What people could see in this sort of stuff to admire was beyond him and he wanted none of it. He came up here with the full intention of carrying back some forty or fifty partridge and as he could not, he would fool the crazy molly-coddle of a nature lover that he had heard talking about the "Big Drummer." He had refused to drink with him, and he'd fix it so that "guy" would not get the "Big Drummer" or his name was spelled differently than he thought.

He knew the trail the other would

take that very morning, and he also knew a shorter one that crossed the other before coming to the range that was said to be "pre-empted" by the big partridge and his families.

He turned and re-entered the cosy little log-cabin and going to his bed he fumbled beneath his pillow and drew forth one of the flasks he had purchased the day before. Drawing the cork he took a long "pull" at the bottle and accustomed as he was to "powerful medicine" it half strangled him. He made a wry face

and remarked as he replaced the bottle in its hiding place, that it *was* wonderful what these loggers could stand in the way of drink. "Well, it has the 'kick' anyhow, and that's the first real 'live' stuff I've seen up here," and as the whisky warmed him up he began to actually feel full of 'pep.'

The early ones at the breakfast table were astonished to have him greet them with a smile and he even forgot his dignity so far as to joke with the waitress, and she became so excited that this great man should notice her, that she spilled part of a cup of hot coffee in his lap and he roared with laughter at an accident, that the day before would have sent him off into a towering rage.

Half way through this morning meal he saw the young fellow who was out after "The Big Drummer" finish his breakfast and hustle off to his cabin to get ready for his start, and as he watched he saw the fellow and his wife both with their guns pass the window on the way to the woods. They were evidently off for the day as they had a camera and a light knapsack along with them.

It came pretty nearly spoiling the effects of his "eye-opener" that sight of man and his wife starting out on a shooting trip together, *his* wife stayed at home when he went on a trip. Why shouldn't all women, and he even started to ridicule the parties that had just left, but the flat silence that followed this attempt warned him that he was on the wrong track and he changed the subject.

Finishing the last of his breakfast in a hurry he rushed to his cabin, filled his shell vest with ammunition, donned his velvet shooting coat and with both bottles of his medicine in the side pockets of his coat he started out. For the first half mile or so he travelled at an ordinary walk, from that time on until he reached the cross roads he fairly ran, and after arriving here and satisfying himself that no one had passed that way ahead of him he took a couple of good drinks from one of the bottles of "Courage" and looking to see that his automatic was full of shells he

proceeded to hunt as he had not hunted before in his life. Every brush heap and fallen log was carefully gone over for the possible sight of a partridge, or sign of partridge, and at the end of an hour's hunt he came to a place where a small stream wound through moss covered banks toward a big swamp some miles below.

Now it had been a wet spring, dozens of young partridge chicks had died and then there were others taken by "wild domestic" cats that had a "hang out" in a nearby thicket. Altogether it had been a rough season for ruffed grouse.

The Old Drummer as usual had chosen well, his harem of some three or four females had located their nests on a high ridge along the swamp and as a result the chicks had had a fighting chance and they had pulled through the wet weather, avoided, thanks to the old hen partridges' cunning, the cats. Now there were three conveys of from five to eight plump birds feeding and gaining their full growth on the banks of the little stream.

The Old Drummer himself was on guard as the fat man with the automatic shotgun in the velvet hunting suit turned the bend in the little woodland trail perhaps thirty feet away. He had been walking as noiselessly as any cat, thanks not to his condition, which was bordering on drunk,—as one of the flasks was nearly empty now,—but the roadway here was a mess of moss and damp leaves, making ideal stalking for the still hunter, even in the condition of our friend.

Up went the barrel of the automatic, but the flash that followed was not quite quick enough to catch the old sentinel, splintered twigs scattered as the charge of No. 8 shot struck the brush below where the big fellow had been perched, and then followed a regular circus of excitement as twelve partridge, one after the other, burst from surrounding cover and tore away in as many different directions. The automatic was a good gun, but in the hands of this fellow crazed now with the logger's whisky that he had been absorbing

all morning, it was merely an instrument to make a noise with, one grouse going straight away, a dead easy shot even for an ordinary marksman—and he of the velvet suit did not consider himself ordinary in anything, was he not a "crack" at the traps? Why this was easy and as he tried to line up on this living catapult he felt sure of him. Three times in as many seconds he pressed the trigger and at the third shot his gun was empty and he saw the partridge make a whirl to the

right a hundred and fifty yards away among the tall timber and disappear.

With a curse he shoved in six more shells and forgetting to put the safety on, he pulled the gun off accidentally and at the seventh report of this big twelve gauge a young grouse that had been lying close during the fusilade got up and made a break for cover, two more shots from the "sportsman" greeted him as he hurried away, two more misses and then the man with the gun sat down on a log, shoved the 'safety' on his weapon onto safe with trembling fingers. Then weakly cursing his own shooting, the gun, the Big Drummer, and everything in sight, he reached for his second flash. He got the cork out, took a drink, tried to replace the cork, dropped it, and in reaching for it fell backward over the log he was sitting on, and after a few feeble attempts to regain his seat he lay still.

The man and his wife had had bad luck. Not one shot had they had all forenoon. They ate their lunch, took a few pictures and in the afternoon, decided to return by way of the big swamp.. They had heard the volley of shots over there in the forenoon but never guessed they were fired by anyone from their camp. Thinking that perhaps it was some new camping party out trying out a new gun, judging from the speed the shots were delivered at, they could not be shooting at partridge.

The little lady had the lead and was going slowly, watching both sides of the trail, and of a sudden about forty yards away sitting on a log in the shadows she could discern the shadowy form of a huge partridge evidently watching her. Slowly, as she had been coached to do when drawing a bead on standing game, she swung around and the slim barrels of the little twenty gauge lined up on the shadowy fowl under the branches of the old cedar. There was a flash, and the shadow fell off the log, and rushing through the brush as quickly as possible the lady with the little twenty gun picked up the most

wonderful wild grouse she had ever beheld. Truly he was a beauty, and as she regained the trail her husband came up and together they sat down and admired in detail the proportions and plumage of the most beautiful partridge they had ever seen.

A half mile further on the man emptied three shells of his sixteen gauge at two partridges that got up in front of him and bagged them both, but that was all they saw to shoot at. Other "birds" got up but they seemed extra wary and wild and kept out of range, unlike the old cock that the twenty gauge had dropped when he sat presumably thinking he was hidden in the shadows. There was no other birds close enough to try a shot at.

The two "pals" crossed the little stream on a fallen log, a natural footbridge, and the man in the lead ascended a little rise in the bank and topping a log a short distance away was what the hunter mistook at first glance to be an animal. With gun all ready he watched for it to move and then the *things* gradually took shape. It surely, or they surely did look like a man's feet encased in heavy laced boots. With dread clutching at his heart the man ran forward. He remembered the shots of the morning, surely, surely it couldn't have been an accident, and as the man and woman lifted the head of the man by the log and saw and heard his heavy breathing and discovered the empty flask they both were relieved to find it was more comedy than tragedy. The man of millions, *drunk*, lying in his velvet suit drunk, fallen over a log with his three hundred dollar gun beside him and a cheap whiskey flask.

Rouse him they could not, so they took off his coat, made a pillow for him and hurried back to camp. Three hours later the guides brought in the "drunken grouse" and put him to bed as his party were out on a three day trip to another lake.

Two days later, waiting for the train at the little station the man and his wife were approached by the "gentleman" who with a snarl on his

fate informed the husband that if it hadn't been for the d---d loggers whisky he'd never have gotten so much as a look at that "Big Drummer."

Well their ways parted in the big city. The millionaire is having a *real time* now and he is getting horribly fat, but that's his affair. What we want to say is that two lovers of the big outdoors often sit and look at a wonderful big partridge mounted on a natural birch branch that cost them quite a bit to have mounted, but is always with them as a reminder

of one wonderful day in October, the "color" month in the big North Woods.

And in those same woods over by the big swamp you'll find the offspring of the "Big Drummer" to this day. The finest game bird of the woods. Yes and we'll go so far as to say he's away ahead of any importations from Europe or anywhere else. He gives you fine sport, is great eating and has got tricks up his sleeve that makes others look cheap. Let's protect him a bit and keep him with us. He's sure a grand bird, hey?

Prince Will Use Grand Trunk Lines in Ontario

His Royal Highness Will Be Accompanied by Mr. H. R. Charlton Representing the Railway

The Prince of Wales on his visits to the principal Ontario cities will use the lines of the Grand Trunk Railway System. His Royal

Highness will arrive at Hamilton from Toronto on October 18th, and, after being welcomed there, will proceed to Niagara Falls, where he will stay from the night of the 18th until noon of the 20th when he will journey to Brantford.

Guelph and Stratford will be visited on the 21st and Woodstock, Chatham and London on the 22nd. His Royal Highness leaves London on the afternoon of the 23rd for Windsor, and his visit to the Border Cities will conclude his tour of Western Ontario.

The Prince will leave Toronto, again traveling by the Grand Trunk, on the night of Friday, October 24th, and will spend the week-end at Kingston, in the Thousand Islands region, leaving that point on Monday, October 27th for Brockville and Montreal. The Royal train will be hauled by the big pacific type of locomotives of the Grand Trunk.

Mr. H. R. Charlton of the Grand Trunk has been designated to accompany his Royal Highness while on the lines of that System. Mr. Charlton has been the representative of the Company on the various Canadian tours of important personages during the past twenty years. The Emperor of Japan conferred on him the Order of the Sacred Treasure following the visit of Prince Fushimi to Canada.

Mr. H. R. Charlton

Shooting Upland and Yellow Leg Plover

REGINALD GOURLAY

THE pursuit of these birds (especially the former) though not a dangerous sport, has its moments of excitement, and requires better shooting often than the comparatively tame sport of duck shooting over decoys.

Let us take the case of the upland plover first. He is a bird of the wide open spaces, not necessarily near water. On the contrary he is often found on downs, and high fallow pastures and uplands, hence his name Upland plover.

It is remarkable that this bird, though common in the Central and Western prairie states, has only, like the Arizona dove, made his appearance in Ontario within the past few years. He comes in late April and departs in the middle of September, which limits the time during which he can be shot to a few days. He is a fine bird, very good to eat and generally very hard to catch; being for the most part, as cunning and wary as a wild goose, while on some rare occasions he displays an imbecility almost as great as a country "know it all." Though hard, almost impossible to stalk, on the barren pastures where it is chiefly found, I have known an upland plover to come sailing up, and calmly perch himself on the top of a tree, a barn or telegraph pole within easy range of me, looking as satisfied with himself as a new made knight or bride. He is the only species of plover as far as I am aware that does this stunt. His cry is loud and peculiar, rising to crescendo and then gradually diminishing. It sounds like, "Widder, Widder, widder" as if the bird like some men, had been deceived by that proverbially fickle and uncertain portion of the fair (and unfair) sex. This frequently gives him away, as it does in the case of a man similarly afflicted.

The best way to hunt Upland plover on foot is as follows:—I might explain that I am writing of hunting

in Ontario and not the prairies where they go out with buckboards.

Suppose two men go out and sight a flock of Upland plover on one of those large open spaces which they frequent. A dog trained and accustomed to plover hunting is most valuable. An untrained dog is worse than useless. A young friend and myself along with a good dog hunted plover after this fashion. We found a flock of plover, so we separated and went on the opposite sides of the flock and then sent our dog who was well trained to hunt them up. As we had taken good cover we were sure that one of us would get a shot, sometimes we both managed it. Then we followed up another flock and went through the same process. If we had followed the usual way and had tried to stalk them we might have taken from then to the day of Judgment to get a shot at them. My Irish Spaniel Rex, (now deceased) was the dog we used for this game. Rex was a very versatile and talented dog, and was at his best, intellectually speaking, at this unusual kind of hunting. When hunting partridge, woodcock, or snipe, Rex displayed the usual points of a well-broken, steady Irish water spaniel, hunting close to the gun, quartering carefully and retrieving beautifully. When after Upland plover, he employed different means altogether, which clearly showed that he possessed brains. Quartering carefully, sometimes almost crawling like a cat, sometimes galloping wildly, Rex would gradually shepherd a flock of plover till he brought it within range, and sent it over or past either my friend or myself in such a way as to give us easy shots.

The Yellow Leg or Yellow Legged Plover, larger and smaller is found, in rapidly decreasing numbers I fear, all over Ontario wherever there are lakes, marshes or even ponds. He must always be near water, in which respect he differs from the Upland

SAVAGE

the rifle you asked for —

The New .22 Savage N. R. A. Rifle

WE take pleasure in presenting to our friends the latest product of the Savage Arms Corporation, Utica Works—the new Model 1919 Bolt Action Rifle.

This rifle is the result of years of experimental work, guided and checked by the ablest military and civilian experts.

It is the most serious instrument of precision that has ever been manufactured to shoot .22 rim-fire ammunition. Designed especially to fill the exacting requirements of National Rifle Association small bore match shooting.

The .22 Savage N.R.A. is a genuine miniature military rifle. It is a bolt-action, five-shot repeater, with full length military pistol-grip stock and swivels for sling. It can be used in every position, with every time-limit and for every kind of fire that the .30 Service rifle can. The only match condition that need be changed is length of range. And it will beat the Service rifle at 100 yards.

A new rifling system makes the barrel more accurate than other .22 caliber models used in this work—and Savage reputation for accuracy made the experts select us to build this rifle.

A new firing-mechanism—lightened moving parts with less than half-inch travel, long, husky mainspring and two-point firing-pin—make ignition instantaneous.

The Marine Corps type front sight defines clearly in any light, and the simple, strong aperture rear sight has click adjustment for elevation and windage—one click moves shot one-quarter inch on target at 25 yards.

25-inch round barrel, full military stock, oil finish, pistol grip, sling swivels, Marine Corps type front, and wind-gauge aperture, rear sights. 5-shot detachable box magazine, Chambered for .22 Long Rifle cartridge only. Supplied in .22 Short on special order only.

And remember—it's as good for small game shooting as for target work.

25 Yards—10 Shots, ½-in. bull, by Marine Gunner J. L. Renew, U. S. M. C.

50 Yards—9 Shots, 1 inch bull, by Marine Gunner J. L. Renew, U. S. M. C.

Mr. Reginald Gourlay, Picton, Ont.

plover. He will also decoy, whereas the Upland plover will see you to a place where sleigh bells never jingle; first.

The larger variety of the Yellow Leg is about the size of the Upland plover, but has much longer legs and is as good tasting. He has a beautiful resonant note, which some people can imitate. I can't so I naturally call the people who employ it to get the birds within range—beastly poachers. He is not nearly as wild as the upland plover, though of course hard to approach in places where he has been much hunted. I will give an instance of how tame the yellow leg plover can be at times. One day last fall I had been snipe shooting with pretty poor success until about three in the afternoon. I was about to turn homewards when my eagle eye caught a gleam of water in the middle distance, through a belt of poplar and willows. "I directed my steps thither" as the novelists say and found a fairly large pond of clear

water surrounded by shallow marsh and just the place for plover. It turned out to be so, for I had not gone far into it when I came on a row of seven yellow legs standing up as stiff as ten pins, and just as motionless. I had to walk up right up to them before they would fly. There were over forty of them in that little marsh and they all acted as tired and dozey as a food controller when he is asked to do something for the consumer. Not being a game butcher I only shot six. When I came a day or two later with a friend there was not a bird in the marsh. The birds I had encountered had evidently belonged to a tired flight migrating that had stopped at the view of what looked like a suitable feeding place.

Both of these species are fine birds and have the advantage of being on hand early in the game season, the Upland plover a good deal too early as he leaves Ontario about the fifteenth of September.

In speaking of the Upland plover and the Yellow Leg, I am sorry that Mr. Gourlay did not tell us how to protect the few remaining, instead of how to shoot them.

Mr. Gourlay states that the Upland plover, like the Arizona Dove, has only made its appearance in Ontario within the last few years. As a matter of fact that Upland plover or better known as the Bartramian Sandpiper, was fairly common all over western Ontario forty years ago, but for the last twenty years is seldom seen. I suppose Mr. Gourlay has reference to the common mourning dove when he makes mention of the Arizona dove. There are at least four different species of dove found in Arizona. The mourning dove is the only one found in Ontario and it has always been here although never in large numbers. Fifty years ago it was much more numerous than now.

W. D. Hobson.

Daylo would have prevented this!"

—"if only you'd used a Daylo to hunt down that trouble under the hood, this wouldn't have happened."

Of all the foolish uses of matches—and they are legion—none is quite so dangerous as around your automobile.

On the road or in the garage, whenever light is required around the engine or in-

side the tonneau — when tires must be changed, side curtains fixed, or a signpost read in the dark, Daylo is the absolutely safe light. You can safely hunt even a gasoline leak with a Daylo.

Stop taking risks with your car; get a Daylo now—you will want it with you wherever you go.

Look for the Daylo "Safety First" medal design in the dealer's window; he will have the right Daylo for you.

October Days

ROBERT PAGE LINCOLN

FOR the man who loves angling the autumnal season has witcheries and pleasures galore. Nature in this season is arrayed in her most lovely garments: every bush and tree seeming to rival its mate in displaying a coloration that is as diversified as it is splendid. Let not the waters, lakes and streams be forgotten in the month of October. Not every person is able to take two or three weeks off in the autumn; yet one could wish for no better time in which to camp at some secluded lake and enjoy not only a peaceful sojourn into the heart of Nature, but one can obtain the best of fishing under admirable conditions. The days of October are never too warm, nor yet too cool. They are just right, agreeable, "appetizing to the brain" as my friend, the doctor has said. There are many who combine a hunting trip with fishing during these days. If one has a motor craft and has a series of waterways and lakes "at one's finger-tips," he surely can attain to some ideal sport. Instead of arranging a temporary camp he can shift from place to place as fancy decides, enjoying good fishing, and also a chance to drop a few ducks. The true sportsman and angler is always content with the small bag. A few ducks, a few fish, and the feasting of the mind upon natural surroundings—all these things go to make the October autumnal days the sweetest in the year. Above all I love the autumnal days for the reason that to the angler, at least, they are days of contemplation. The sweat and enterprise is out of the air. The wilted collars are no more: the beads of perspiration are things of the past. One views his surroundings with a mind that is content to take things as they come. Peace—that is it. The fretfulness, is for a time at least, faded into the beyond.

Sadly, not all are able to make prolonged trips into the quiet places, in the autumn least of all. One should not lose track of nearby lakes. In fact in lakes where in the summer season little or no luck has been the result, the autumn sees a change in things—usually for the better. This is especially true in lakes near to, or within the confines of civilization. During all the summer season the waters may have been littered with boats and canoes; and all the so-called gay crowds, titling inanities, and the "pomp and glory" that goes with a cheap civilization.

Sincere anglers and otherwise have fished the waters but have had little or no success. The reason may be plain as the nose on your face. The fish have steered shy of the crowds and have kept themselves in the places in the lake where some quiet at least reigned. I know of just such a lake. In late August the crowds begin to melt away. In September the lake is quite left to itself—no one seems to care to go out and fish, because, they believe, the fishing being poor in the summer it certainly cannot be any better (and can only be worse) in the autumn. I went to this lake last autumn in the early part of October, and there was not a boat on the lake. By practicing all the angling craft that I have garnered through years of study of the fishing game and especially of fishing in waters within civilization, I was able to garner in all the fish I could make use of. It seems that as the crowds leave the lakes the fish gradually become more active, for the sensation of peace again upon the waters is a strange one to them, as we may suspect. Lakes that are abundantly fished need to be fished in the autumn even as shyly as at any time. In this lake in question, in early days we were wont to go out off of a certain sand-bar and catch any number of large copper-bellied sun-fishes, fully as large as two hands, fishing in twenty or thirty feet of water. But in late years, in the summer this has proven impossible. The reason? The gay crowds have done it for off of that same sand-bar, in the summer one might fish a week and not have a nibble, though the fish are there. I have seen them on clear days down there by the thousands.

True to my expectations I fished off of that same sand-bar in the early morning and in the early evening and had good luck. I also found that the fish would strike well around the shore. I used a fly-rod and for bait used grasshoppers attached to the hook by means of a small druggist snap which is an unfailing method of connecting a lure to a hook. No doubt my success off of the bars may be laid to one thing in special. I used a nine foot leader, which, being practically invisible in the water no doubt served to foil the fish. If I would have had the same success with just the ordinary twelve pound test soft-braided silk line I do not know, but I am forced to admit that the fish in this lake had seemed to have acquired a pretty good notion as to what a

DU PONT CANADIAN INDUSTRIES

The Shooter's Instinct

THE man who shoots soon comes to know by instinct what he can expect from a powder. The best powder is the one that most quickly and unfailingly "responds," exploding with clean, quick energy, with maximum speed and an even pattern and with low recoil.

These qualities have made DuPont Powders universally accepted as the standard for field, forest and trap. For over one hundred years we have been making Powders for sporting and military purposes. DuPont Powder is used by all ammunition loaders for shells and cartridges of all gauges and loads. You can be sure of the reliability, penetration and speed of shells and cartridges loaded with DuPont Powders, and of their high and uniform quality.

DuPont loaded shells are sold by hardware dealers, sporting goods stores and most departmental stores throughout Canada.

E. I. Du Pont De Nemours & Company

Wilmington, Del., U.S.A.

DU PONT

line was. It does seem queer too. Here were common fishes, sunfishes, and one must needs fish for them as craftily as for some trout. I often get letters from anglers stating that they have trouble in still-fishing by making no catches. If still-fishermen will use an invisible leader of six or nine feet to the line they may be surprised at some of the catches they will make.

Still-fishing has a strange fascination, though in any other month than October or late September the true angler may pass it by. Still-fishing, using a light bamboo rod, a reel and light tackle has all the earmarks of the sportsmanlike. To play a large croppie, rock bass or sun-fish up from a twenty or thirty foot depth is a sensation comparable with the best the angling pastime has to offer. The October angler who comes home with ten or fifteen sun-fishes in his basket, or perhaps a bass or two, is certainly lucky. This will appear as a poor showing to the man who is

not content unless he garners in enough to fertilize his garden with, but the sane angler knows that a few are enough and plenty.

October is a month of many surprises to the angler. I have known autumnal days when the fish have seemed utterly to have left the lake, and then on another day they will strike with all the avidity they have displayed in June. On one October day I caught fifteen bass, allowing the certain set number have their freedom. The sun-fishes, too, were striking good as the catch of my partner showed. In the case of the bass they took practically any bait that was offered them. Something had seemed on that day to have planted, in all the finny life of the lake, a feverish energy. The angler instinctively knows when these days occur: years of knowledge, of study of the game is sure to bring about this condition.

Nevertheless caution is a demand in autumnal fishing: caution and a great deal of it.

Wild Life Sanctuaries

J. B. HARKIN

Commissioner of Dominion Parks

IT is assumed that the subject of wild life sanctuaries was assigned to the Dominion Parks Branch because the Dominion Parks in the West, which aggregate about 10,000 square miles in area, are maintained as game sanctuaries. They have been maintained as such for a period of about ten years and if an exceedingly great increase in wild life is the test of their success then there can be no possibility of doubt that sanctuaries

properly and fearlessly administered would inevitably result, not only in the preservation, but in the very great increase of all forms of wild life.

In the Parks to-day, the casual visitor does not need to be told that wildlife is abundant. He constantly has the best evidence of this fact because wherever he goes his own eyes show him that this is a fact.

Perhaps the greatest results have been

Smokeless Shotgun

POWDERS

IN THE RIGHT
DIRECTION

INFALLIBLE

In the Right Direction

The sportsman who begins his day by buying shells loaded with Infalible has started on the high-road toward success in the field or at the traps.

Many veteran sportsmen shoot only Hercules Smokeless Shotgun Powders. These men are old hands at the game and know that if they expect success they must use powders that are *dependable*—that always give high velocity with light recoil and even patterns. *And they know that they can always depend upon Infalible.*

You can profit by their experience by buying shells loaded with this powder. Any one of the fourteen standard brands of shells listed here can be bought loaded with a Hercules Smokeless Shotgun Powder. When you buy shells, look on the end of the box or on the top wad of the shell for the name Infalible. Start now in the right direction by using Hercules Smokeless Shotgun Powders.

obtained in Rocky Mountains Park, of which Banff is the centre. Even in the town evidence of the results can be seen from day to day. At the most unexpected moments walking along the streets and paths of the town a person will meet deer. It is a common practice among residents to have deer eat bread and other articles of food from their hands. In fact, the deer have become so plentiful that last year some of the residents actually started in circulation a petition to the government protesting against the depredations of the deer in flower gardens and back yards and demanding a remedy. I may say that this petition for some reason or other was dropped, but no better evidence could be submitted of the success of the Rocky Mountains Park as a sanctuary.

Ten years ago in all the districts within easy access of the railway big game had practically disappeared. Although there had been regulations forbidding the taking, killing or wounding of any wild bird or animal since 1890, it was not until about 1909 that an effective warden service was established. At that time, deer were rarely seen near Banff and sheep and goats were to be met with only in the outlying portions of the park.

To-day a person can sit on the piazzas of the Canadian Pacific Hotel at Banff and with a pair of glasses pick out mountain goat along the slopes of Mt. Rundle, the jagged saw-tooth mountain that lies directly opposite the hotel.

I have seen people at the golf links repeatedly stop in their play and watch mountain goat on this mountain. The golf links lie immediately at its base.

The black bear has become so plentiful that from time to time a good many of them have to be shot by the wardens because they have developed a liking for the larders of the citizens. In fact, only a few days ago a letter came in from the Alpine Club stating that, unless some special means of protection of their property against black bear was provided, it was considered that the club could not open its club house for guests.

If a person will walk or ride along the main automobile road west of Banff for a few miles, he is sure to see mountain sheep. He may see a few or he may see a couple of hundred. Often when an automobile proceeds up this roadway it has to slow up in order to let the sheep walk off the road. Photographs of mountain sheep, which as you all know, is ordinarily one of the shyest of animals, can be taken from the seat of an automobile.

The conditions which I have recited with respect to wild life in the vicinity of Banff prevail throughout the Park.

In this connection, I beg to draw your attention to a few extracts from diaries of the game wardens. These extracts have been picked at random and cover all our Alberta Parks:

"Sawback District, saw about 150 sheep; Government Ranch and Panther River, counted 35 deer; Ranch to James River, saw about 70 deer in my day's travel; Banff from Lake Louise, saw about 40 deer, 60 sheep and 14 goats; N. End Park Hay River, there are quite a lot of moose along the north end of Park and caribou is plentiful north of Hay river."

The facts which have been given you demonstrate, I think, clearly that a game sanctuary efficiently protected invariably delivers the goods.

One of the main reasons of the success of sanctuaries is the fact that wild life very quickly learn that they need have no fear of molestation by man. The deer on the streets of Banff, the mountain sheep in the immediate vicinity of Banff bear this out.

The fact that animals very quickly learn that a sanctuary is a sanctuary was forcefully brought to the attention of the Department a few years ago by conditions that developed at Buffalo Park at Wainwright. The development came in the form of a protest from the residents in the vicinity of the Park that the Park was becoming a sanctuary for coyotes. As you know, at certain periods of the year, a good many of the farmers in the West go out coyote hunting for the specific purpose of reducing the numbers of this predatory animal. The farmers in the vicinity of Buffalo Park came to the Department with a complaint that as soon as they started coyote hunting all the coyotes made a "bee" line for the Park where they evidently knew they were safe. There was no doubt about the facts of the case and the result was the Department itself had to go into coyote hunting with dogs and traps within the Park.

The eastern portion of Jasper Park and the contiguous country outside the Park has a large wild life population. Wardens who patrol that area report that as soon as the hunting season arrives all the wild life which they see is inevitably headed in one direction and that direction is towards the Park.

These facts are recited to emphasize one of the fundamental justifications for wild life protection by sanctuaries, namely that wild

life very readily realizes where the areas are, that they are free from molestation, and as such invariably do take advantage of them.

There is another matter in connection with sanctuaries which experience in connection with the Park sanctuaries has brought out and that is the public are very readily educated as to the sanctity of the Parks from the wild life standpoint. Of course a preliminary and necessity in connection with this education is administration with a firm hand. Despite the huge area of the Parks there is very little poaching. I think that the great majority of people after a very few years become thoroughly sympathetic with the efforts of the administration to protect the sanctuary and have no desire to go out to kill. The small element who fail to develop such sympathy, on the other hand develop a wholesome respect for the strong arm of the law.

Indians have a bad reputation in the eyes of most of the public in regard to the matter of game slaughter but even the Indians appear to have been educated to at least respect Park boundaries. We practically have no trouble whatever with the Indians in the matter of the protection of wild life in the Parks.

A few years ago there was an incident which illustrates how completely even the Indians have accepted the idea that there must be no game slaughtered within Parks Boundaries. A prominent provincial game warden had just completed a patrol through a large mountain area not within a park and found that the Indians had been through some time previous and had carried on the most reckless slaughter. He travelled for several days without seeing fur or feather. The previous year he had patrolled the same area and knew that at that time the district contained a fair proportion of wild life. As he proceeded homeward with this lesson fresh in his mind he came onto a camp of Indians close to the boundaries of one of the parks. There had been a suggestion that this Park should be reduced in area and the portion along which the Indians were camping should be thrown open. The first question these Indians asked the warden was as to the date when this area was to be thrown open because they desired on that date to begin a big hunt. The warden was so impressed with what he had seen in the devastated area and what he saw would happen in the other area, that, though he himself had expressed himself favourable to the reduction of the area of this Park, he

promptly went to a long distance telephone and reached me at Edmonton where I happened to be, to urge that under no consideration should this Park be reduced in area. It is scarcely necessary to add that the reduction did not take place. It seems to me that this incident when it shows that even the Indians have a wholesome respect for Park boundaries, that there is every reason to believe that white men who may be inclined to slaughter wild life can all the more readily be educated to the fact that a game sanctuary must be respected.

In connection with the protection of the game sanctuaries, the first essential is a policy of absolute unrelentless pursuit of all offenders and this policy has probably been one of the main reasons for the success of our sanctuaries.

Game wardens are born not made. They must have above all things a very strong natural love for wild life. With such officers the rest is simple. A few years ago in one of our parks we had a case where a game officer prosecuted his own brother.

When the public, Indian or white, recognizes that an offence will be followed up no matter what the cost or what the effort they evidently make up their minds that any hunting they do shall be done elsewhere than in a sanctuary.

With respect to regulations, one of the most important is that there shall be an offence for a person to have an unsealed firearm in his possession. Under the regulations the moment a firearm is brought into a Park it must be presented to the warden for sealing and it must remain sealed so long as it is within the Park.

Another important regulation is that any parties which outfit within a Park for hunting purposes outside a Park or which go out on trail trips with guides must be registered. The failure to do so constitutes an offence. With registration the chief warden knows at all times how many parties are out on the trail and the routes they are following and with a system of criss-cross trails it is comparatively easy for the wardens to keep in touch with such parties. Of course the telephone system in use in connection with fire protection is also a great aid in this connection. Under the system which I have described it is comparatively easy for a small body of wardens to efficiently patrol and protect the large area.

Our wardens look after both fire and game protection and yet in Rocky Mountains Park

Will He Hit?

That depends—partly on the man but more on the gun sights he is using. Hunters who know place their dependence on

MARBLE'S RIFLE SIGHTS

They have found them absolutely reliable under all conditions—their use has greatly improved their shooting. Amateurs as well as seasoned hunters will find a type of MARBLE'S RIFLE SIGHT to their liking.

MARBLE'S V-M FRONT SIGHT

Embodies a principle of sighting new to most shooters but it improves their shooting wonderfully. Easy to see in any light. Price only \$1.65. State make, model, caliber.

MARBLE'S REVERSIBLE FRONT SIGHT

Has two beads—one ivory, one gold. Instantly reversed so shooter can have either, as light requires. Choice of 1-16, 3-32, or 1-8 in. bead. Price \$1.65.

MARBLE'S DUPLEX FRONT SIGHT

Ideal for shooting under any condition. Fine bead 1-16 in. gold, coarse bead 1-8 in. white. Beads fold down flat. Price \$1.65.

WRITE FOR CATALOG—Leading sporting goods dealers handle Marble's Rifle Sights, but if you can not secure them, write for catalog of Marble's Sixty Specialties for Sportsmen.

MARBLE'S FLEXIBLE REAR SIGHT

Does not lock up—held by double acting spring. Can't be injured by blows or shocks—always ready for accurate shooting. Can be locked down and instantly raised. Price \$3.30. Give make, model and caliber when ordering.

MARBLE'S IMPROVED FRONT SIGHT

Gives the shooter a good look ahead. Objects aimed at can be seen over or under bead. Makes accurate shots possible at any range. Price \$1.10

SHEARD "GOLD" SIGHT

Will not blur in bright sun light and show up clear and distinct in dark timber. Price, \$1.65.

our warden force consists of only eleven, in Jasper Park the warden staff is fourteen, in Waterton Lakes Park the warden staff is six. This is a very small force when you consider the large areas to be protected, Rocky Mountains Park covers approximately 3,000 square miles, Waterton Lakes park, almost 500 and Jasper Park nearly 5,000 square miles.

You will notice that the points I have endeavoured to make are in the first place, that sanctuaries do result in a very great increase in wild life and that these results are obtained primarily through the following causes;— that the animals themselves readily recognize and take advantage of sanctuaries: that the public, including Indians, can

be very readily educated as to the sanctity of sanctuaries and that energetic, fearless and unrelenting pursuit of offenders, together with intelligent patrol work and the insistence of the sealing of firearms practically eliminates any destruction of wild life within sanctuaries by man.

Results in the Dominion Parks sanctuaries have been so successful that it seems to me it would be good policy for a careful survey to be made in each province of the Dominion, before it is too late, with a view to the setting aside of areas for sanctuary purposes in order that there may be an absolute assurance that for all time there shall be no danger of the disappearance of the characteristic wild life of the Dominion.

Points on Migratory Game

Editor, *Rod and Gun in Canada*.

One of the topics among sportsmen at the present time appears to be "How can the shooting of game be extended, and all share on an equal basis, in a fair quantity, for years to come?"

This may be answered intelligently and positively in a few words,—Stop the killing of it. Just so long as these inviting opportunities are nursed by the law, and the wanton game killers respected,—that period, long or short, will give lean returns, dwindling into insignificance.

The apparent cause of game scarcity undoubtedly may be charged to the enemies of wild life, of which there are many, and naturally these must be eliminated or curbed so strongly, that they exist in the minority.

We are now confronting a future for gain or loss, and the former demands drastic laws, regardless of whom it may bar against the ethics that conform for more game, and the over use of the shot gun.

I wish to speak mainly in reference to our migratory water fowl, in which the "Federal Law" plays the big hand universally in the game.

Over the line in Canada, the great hive of the ducks and geese, there is much to be considered, for it is there that four-fifths of these migrants colonize, grouped within the recuperating zone that Nature has designed especially for the deep feeders, including the envied "Canvas Back."

The ducks may never increase again to the numbers of the days when the muzzle loaders were used, but if enumerated today, the

census will total numbers upholding the Migratory Bird Law, to which every sportsman, American or Canadian, may well pay his tribute.

From my viewpoint, considering the impediments along the lines of the breeding areas in the zone, and as well the vast increase yearly in the number of gunners, naturally forbids, the long open seasons, the over liberal bag limits, and in many states the use of the floating battery, machine guns and dummy environments, assisted by wholesale grain feeding, depleted wild rice areas, that are being neglected, all are among the agencies that are suppressing our wild fowl colony.

If every gunner that wages a day, and as well the open season's bag limit, kills his allowance, how then can the game increase, all else being considered? As it is may hundreds of sportsmen are being disappointed, not bagging a bird in the entire day, while those in the battery and baited feeding beds and envied shooting points, kill the day's allowance and that of the open season as well.

Tell me why at the present time any gunner should kill more than fifteen ducks per day, or more than one hundred for the open season? He should shoot for his family only, and not for his neighbors as well. I have known men who have shot for sport mainly, and have given away their ducks to unappreciative people,—then shielding their disgraceful ethics, complain of not having a sufficiency for the larder.

They may also complain of having one day

only in the open season, and not getting more than fifteen birds, when the opportunity was ripe for twenty-five or forty, and this is right where the shoe pinches on the game hog who is killing the goose that lays the golden egg. He will ask a farmer for an apple from the inviting fruit burdened tree, and in response fill his pockets and blouse and tote the balance to a cache like a red squirrel.

These are among the big links in the chain of destruction that is rounding up our waterfowl, and if it were not for a few of the ducks that escape the full day's bag limit and that of the open season as well, we would have only mounted specimens to gaze upon.

Already there are far too many pursuers of the envied game birds, who should devote a period in the open season to the extermination of their enemies, both for sport and beneficial results throughout, and restraint from the pounds of meat.

The time is coming soon, to fish or cut bait in one universal closed season in America. In fact, I would personally forgo the pleasure of one season's outing for the realization of fifty years ago. Sportsmen's organizations in the Province of Ontario, Canada, are contemplating the daily bag limit of fifteen ducks, and the open season limit of one hundred,

providing that corresponding restrictions be assured in the United States.

Hundreds of duck nests and their contents of eggs were destroyed this season in the north and in southern Canada, by over normal rainfall, and the ambitious gunner this season may not be gratified with too full a realization.

It should be the ambition of every sportsman and conservationist to seek laws that will suppress the destruction of our wild game, from the ice-bound shores of Cape Nome to the tropics of the South, and that hot-bed of slaughter, Mexico.

There is only one straight and narrow way to save migration,—i.e., stop killing it to excess. Take a light toll,—do your duty manfully,—stand by the Migratory Bird Treaty,—and let the rest go.

F. H. Conover,

Honourable Superintendent,
Point Pelee Dominion Park.

Leamington, Ontario, August 14, 1919.

The above timely letter appears simultaneously in the American Field of Chicago and *Rod and Gun in Canada*. It is noticed that Mr. Conover mentions Battery shooting. This mode of killing is forbidden in Canada. —Editor, *Rod and Gun*.

The Passing of the Prairie Chicken

Editor, Rod and Gun.

I have read with great interest the various letters of the readers of *Rod and Gun* on the subject of game conservation; of how the different species are disappearing especially the prairie chickens of the west. Then the many agencies that are to blame in the estimation of the writers, such as crows, game hogs, magpies, coyotes and etc., but I think there is still another that is more destructive and far reaching than any of the ones mentioned. It strikes at the foundation of the species so to speak, as it destroys the birds that have passed through the hardships of winter and are about to take up the home duties of spring. The killing of a pair of these birds means the passing of an entire flock at the beginning of the hunting season.

The agency I have in mind is the various poisons set for the gopher, or more strictly speaking, the lax methods of its use.

Since coming to the west I have seen the passing of the numbers; and the few that now remain will follow unless the handlers of dan-

gerous poisons are brought to a full understanding of the destructiveness of the mixtures they handle.

I have in mind three instances of farmers putting out poison with a spoon from a pail, and none of the three took the trouble to stoop down and put it in the gopher's hole out of the reach of the birds; but just stood up and threw it at the rodents doorway and passed out to the next sometimes without stopping to see where it landed.

Having occasion to visit a drug store in one of the larger towns of the Province of Saskatchewan I noticed a poster announcing the advent of "Our own Gopherscide." Being interested I asked the man in charge if it would do all that was claimed for it and he said "Yes it will, for I have a farm and put out some for gophers and they are scarce down there now; I also found a crow that had passed in his number. I expect he got some too." I asked him about the chances of our other birds and he seemed surprised at my question. I believe most of us can recall the poisoning of valuable farm stock as

JAEGER FINE PURE WOOL

For the Man Who Is Out of Doors

Anyone, who is much out of doors—the soldier, the sportsman, the lumberman, the engineer, the prospector, the miner—will find Jaeger Pure Wool Garments wonderfully comfortable and durable for outdoor life.

Here are some useful garments:—Sleeping bags, blankets, travelling rugs, sleeping caps, colic bands, chest protectors, underwear, hosiery, shirts, pyjamas, stockings, sweaters, cardigans, spencers, knitted waistcoats, ulsters, caps, gloves, etc.

Hardy's The Great British Specialists In "Palakona" Regd. Split Bamboo Fishing Rods

THE "DE LUXE" ROD, made of Steel-hard "PALAKONA" is Hardy's latest design in single-handed rods for wet or dry fly fishing.

IT is the product of the largest, and best equipped factory, supervised by the champion Professional Fly Casters and Anglers in Europe, "Hardy's." Don't forget that as wages in Great Britain are 75% less than in America we can give greater value in high class hand work. All our rods are hand made by experts whose lives have been spent at this work, for which 50 GOLD MEDALS have been awarded. Length 9-ft., weight 5¼ ozs.; 9-ft. 6-ins., weight 5¾ ozs.; 10-ft., weight 6 ozs. All fitted with Hardy's patent screw grip reel fittings.

DRY FLIES—As made by us for the late F. M. Halford Esq., for whom we also made rods, etc.

GUT CASTS—The Anglo-American tapered mist color No. 1 medium, No. 2 fine, as made for Mr. Halford.

Stout to 4X Ditto, Ditto to 3X, Stout Lake to fine, Ditto to medium, Ex-stout to MEDIUM, Ex-stout to stout, 6 ft.

We will be pleased to quote prices on receipt of inquiry.

Hardy Bros., Manufactory Alnwick, England

THE GREAT ENGLISH FIELD says, "We must never forget that it is to HARDY Bros. of Alnwick we owe the supremacy we have achieved as Rod makers."

reported by the papers, due to careless handling of such agents of destruction.

As to a remedy I suggest that our different game protective societies take up with speakers at the meetings of the U.F.A. and the instructors at Better Farming Schools held

each year by the Provincial Governments, the necessity of a proper method of handling poisons: and they could do a great work in the educating of good but careless citizens.

More About the Skunk

Editor, *Rod and Gun in Canada*.

In your August number I read an article about the value of a skunk. Now I can tell you a different story, in the spring of 1918 I was working for a farmer about a mile from Waterloo, who kept some geese and he set two of them with 15 eggs a piece. When they had been setting about two weeks one of them would not go on her nest. About two days later the other goose would not go on her nest, and the farmer looked and there was not an egg to be found. He came to me and said:

"Somebody stole our two nests of goose eggs."

We had been missing about 15 hens and he was quite put out about it, and as we knew we had rats in the barn I thought of rats or skunks, so I set a trap at a hole, under a log, that I thought was a big rat hole. I live in town and about two days afterwards I met the boss and he said:

"Well, Ted, I caught the thief."

I said "Did you?" And at the same time

took a step back from the buggy and said, "I can smell him." He said;

"He was in the trap under the log in the barn and I set another trap about 50 feet from the barn and I caught a big black male, the first was a female. While scuffling potatoes I happened to lead the horse into some berry bushes near the hen house and a hen flew out and there was a nest with about 12 eggs and in about three days not an egg was left."

That same fall I caught four more skunks within 200 yards from the barn.

Now I think some of those biologists don't know how our Canadian skunks act. Now if this letter is not too big for you Mr. Editor I will tell you a story later about a snake.

P.S.—After I had caught those skunks our hens came down to their proper place to roost; before they would perch on the highest place they could find.

Waterloo.

Theo. Sackenbauer.

Editor.—Send along the snake story.

ALONG THE TRAP LINE

EDITED BY

H. C. HADDON

Notes of An Old Trapper

P. O. REILLY

AS an interesting comparison with the high prices being paid today for all kinds of raw furs the following are some of the prices I obtained in days gone by. In the fall of 1862 mink, No. 1, were worth \$5., No. 2, \$4., beaver \$1.50 a pound, red fox 75 cents to \$1.25, lynx from \$2. to \$2.50., marten from \$1. to \$1.25., otter \$5. and \$6., fisher \$4.50 to \$6.00.

From fall of 1862 and winter of 1863 I did

not trap any more till 1876 as I was buying fur on speculation. Since 1876 I have worked in lumber camps and trapped on Sundays, as that was all the spare time I had. The winter of 1886 I poisoned 73 red fox for which I received from \$1.25 to \$1.75 a skin. That same winter I sold beaver for \$4.50 a pound, marten \$1., otter \$8.00 to \$12.00, fisher \$9.00, mink \$1.00, one lynx \$2.50.

The winter of 1888 I was at Lake of the

*It has the

a Giant*

- this new

VICTOR

NO. 1 GIANT
Game Trap

An All-Around Giant in Jaw-height, Spring Action and Power

A new and different Victor Trap—a Giant in name, size and strength. A modern trap that catches and holds far up on the animal's leg. Especially adapted to trapping skunks, muskrats and mink.

"Trappers, here is your chance to secure this modern Game Trap at an unusual low price. We are sending samples to all parts of Canada. If you wish one of them, cut out the coupon at the bottom of this page and mail to us with 31c."

Jaws Catch Far Up On the Animal's Leg ---Spring Rises High

Right here is where giant size counts, as the spring and other parts of the trap are built proportionately larger to take care of the additional height of jaw.

The pan and dog are wider and heavier, the chain is larger and the spring faster. The trap is also equipped with an improved swivel at the point where the chain connects with the spring, and possesses all of the regular Victor improvements, such as non-freeze, non-clog, "humped cross" and direct pan fastening.

Please send me as per your advertisement in the *Rod and Gun* a sample of your new Victor No. 1 Giant, for which I am enclosing 31c.

Woods and caught or rather poisoned three silver foxes. For two of them I got \$65.00 each and for the other I received \$75.00, also a cross fox for which I got \$25.00. Had I known the proper value of the silver foxes I should have received \$300 each for them as I saw one sold in Seattle for \$800, not nearly as good as mine, two years ago. During all my time trapping I never got \$3.00 for marten, \$2.00 was the outside limit, and \$9.00 for fisher. The highest I received for otter was \$16.00, they being very large and dark.

In poisoning I use strychnine for either foxes or wolves. I will give you my plan of the way which I used to set it out, and if not taken would lift it every morning. In the first place I had a bait set out such as a cow's head or offal from cattle killed at the lumber depot, farm or camp. These I had scattered round the fields, or if near a lake had them taken to the lake when frozen, then the ravens would tackle it and then the foxes would after the ravens had first tried it, as a fox or wolf does not like to touch anything until some other animal begins first.

I then made myself a wooden knife of maple, also a small skewer of the same wood and had these two boiled in the lard I was going to use as a pill and had the lard rendered into a bowl. Then with the wooden knife I would cut a piece of lard about the size of a thimble or a hazel nut. In this I would insert the skewer or fork, lift out the lard and turn back a slice of lard with the knife, drop in my strychnine and cover it with the lard I had pared back. In the evenings when the ravens had gone off I would take my pill of lard on the point of this skewer and go to where my bait was in the fields or on the lake. I would always have a rock or end of a log say two or three feet away from the bait where I could lay my pill and I would do this with a long rod like a fish pole, about eight or ten feet long so as to drop my pill on the log or stone then my tracks would not be near either the bait or pill. I would go straight on, never turning back, and would take a wide circle back to home or camp. Never handle or leave any scent of your hands on anything around. Should you not happen to have enough strychnine in the pill to kill the animal he will never touch lard again. This happened once with me with one fox, but I fooled him by rolling the lard in honey and got Mr. Fox next morning. He was the last I saw, or rather the last and only track I saw of a fox for two years—I cleaned them all out.

In trapping foxes your trap should be

soaked in warm dog fish oil, not too hot or it will take the temper out of the springs.

With lynx the easiest way of getting them is to snare them. Use copper wire set on a trail used by rabbits with loop big enough for the rabbit to get through or high enough to go under. The snare should be fixed to a pole about six feet long with the limbs cut off to about six inches long from the body of the pole so as to make a drag. I have snared three lynx in one night in a cedar swamp by this method.

The cross fox has a dark stripe running from the root of the tail to the head with another one over the shoulders which forms a cross. The tail is usually very dark, with a white tip, of course. Legs black or very dark brown. I have poisoned two cross foxes and four silvers. The first silver was perfectly black with two yellow spots, one in each flank, about the size of a big old fashioned penny which my fur buyer said spoilt its value. I only received \$30.00 for it and it was really worth \$200.00 at that time, but I did not know its real value. I also got two at Ignace on the C. P. R., for one I got \$75, for the other \$65, also a cross for which I received \$20.00. I poisoned another in Algonquin Park but the ravens tore it pretty badly, however I skinned it and sewed it up to look almost perfect but only got ten dollars for the tail. I was told afterwards that the Hudson's Bay agent paid \$300, for the same skin.

The silver fox is generally larger than the red and some are very black on the back, while others are mixed with white and black hairs on tip of hairs 300 per cent. more black than white hairs. The under part of the hair is usually black and the belly black or almost so. Legs black, ears black and tail black with a white tip. The larger the white tip the better the value.

There is a man working in this camp who says he caught a white skunk with a dark cream colored stripe up the back and down the centre of the tail. He tells me he got ten dollars for it from a fur buyer, more as a curiosity than the value of it. There are a few men doing very well trapping on this island, (north B.C. coast). I hear one has caught 21 mink, 44 beaver, 26 coons, 14 marten and one cougar. I fancy he caught his mink and marten too early to be of much value as they were caught in November which is too early in the season for the coast.

Now I guess I had better close or you will tire of my foolish letter, but you will have to excuse an old man in his eightieth year.

NORTHERN ONTARIO

This vast new land of promise is one degree South of Winnipeg, and is big enough to include the six New England and four Middle States of the American Union.

Aside from its immense resources in timber, mineral, waterpower, fish, game and scenery, NORTHERN ONTARIO contains millions of acres of fertile, arable land fit for mixed farming which may be had by returned soldiers and sailors in 160 acre blocks free; to others, 18 years and over, 50 cents per acre.

Already there are thousands of miles of colonization roads and steam railways spreading like a spider's web over a huge part of that immense forest-robed territory.

G. H. FERGUSON, Minister of Lands, Forests and Mines.

50 YEARS' STUDY

Price \$2.00

What wouldn't you give if you could have the knowledge gained by fifty years' experience on the trap line? Supposing you had trapped from Alaska to the middle States and from Labrador to British Columbia and this for fifty years, wouldn't you consider you had sufficient trapping experience to be a success, and one of the best authorities on the ways and means of trapping? And would you not give a good deal of money for the knowledge so gained?

Trapping, you know, is very much a matter of what you use to attract the animals. All fur-bearing animals are very sensitive to certain odors, especially in the running season and if you have good decoys and a little knowledge of trapping you can make the capture of any animal almost sure.

Never-Fail Decoys are the culmination of years of work and study by Indian and White trappers from all parts of North America. They are compounded according to natural laws and not one ingredient is used in their composition that is foreign to Nature's products. By using these formulae you can increase your catch beyond your fondest expectations.

Never-Fail Decoys

are the old formulae of professional Indian and white trappers, brought to their highest state of perfection; as perfect as human ingenuity can suggest.

Certain odors are very attractive to people; likewise certain odors are very attractive to fur-bearing animals, but to a much more noticeable extent. The difficulty in making decoy is this: all fur-bearing animals are attracted by the odor of grain musk. This musk is very scarce; its price prohibitive; and it is therefore out of the question to use it. But there are certain ingredients, easily and cheaply secured, having identically the same attractive power, that can be used. It is only thro' the combined life study of many trappers do we find these out; and few know them. Again two ingredients, when separate, may be attractive; yet when combined they lose their appeal and are worthless. Decoys, to be successful, must appeal to the animals' food and hunger instincts; the ingredients must be Nature's own and perfectly blended. They must be freeze-proof and proof against deterioration. This is the basic principle of Never-Fail Decoys. You can secure them with detailed instructions for all animals, the ingredients for which are easily secured and readily compounded, for only \$2.00.

Absolutely Guaranteed

If they fail to increase your catch your money will be refunded. If you wish to increase your catch, cut out this ad., write your name and address plainly along the margin, pin a \$2 bill to add. and putting it in an envelope, address

ROBERT G. HODGSON, Raglan, Ontario

The Demand and Supply of Furs

GEORGE ROBERT HUNT

BASED on the London fur sales the increase in the price of pelts during the last twenty years has been general, averaging about 25 per cent for the staple fur bearers of Canada. All pelts excepting those of skunks have decreased in numbers during the past ten years. An increase in numbers of skins secured was recorded fifteen years ago, but this was caused by keener hunting and more competition, this being inspired by rising values. Pelts considered of little value twenty years ago are now being hunted and trapped to the verge of extinction, i.e. mink, marten, lynx, fisher, cross fox; and even muskrat the most prolific fur bearer we have shows signs of failing. In general it might be stated that this is due to less fur being produced and more is being used than ever before and this, aided by several other causes is rapidly decreasing our supply. The population of the country is growing and as it grows the number of wealthy people increases. Dame Fashion, whose influence is predominant everywhere, is responsible for a very heavy demand for certain kinds and only the best and scarcest, therefore the highest priced are in favour with her. The growing number of automobiles and other means of travel also increases the demand for furs.

Strange as it may seem the catch of furs today is greater and more valuable than when the country was a wilderness, and while the professional trapper has to a great extent engaged in other and more valuable pursuits, the most of the furs captured in this age are by farmers and their sons. The ever-expanding area of human settlement has caused some kinds of fur bearers to retreat further into the woods. The clearing away of the forests and the grazing of the natural covers by domestic animals have destroyed the fur bearer's haunts and exposed them to their enemies; while the draining of swampy areas has destroyed the homes of the beaver and the muskrat. The fisher and the marten never seem to remain long near the territory inhabited by man, and even the fox, which seems to increase near human settlements, will decrease if the forests are wholly burnt or removed.

If conditions remain as they are with high prices for fur and the utilization of every weapon of destruction to ensure the animal's

capture some species of animals must soon be exterminated. The usual method employed to prevent the complete extinction of a certain species is to establish a close season, and favourable results have been attained as in the case of the beaver, but we still have much opportunity for improving our game laws for there are still certain fur bearers that can be lawfully killed at any time—provided you have a license.

Confronted with this condition of a decreasing supply and an increasing demand, the fur trade has sought to prevent high prices by making popular the use of furs which formerly were considered of slight value. A large part of this work now devolves on the fur dressers and dyers who can render stiff pelts more supple and change the colour of the fur to resemble that of more valuable animals. Ponies, kids, lambs and even pups are killed in large numbers to supply the increasing demand for furs. The great vogue of Russian lamb skins, of which about three million are used annually, emphasizes the importance of achieving production of fur from domestic animals. If the marten and the mink had been domesticated a score or more of years ago they might now be supplying fur in the same way as the karakule sheep and with the modern addition of the fox, would have served as a counterpoise in Canada to the monopoly enjoyed by Russia in the production of domestic furs.

Mink from its lower rank as a coat lining at fifty cents a skin has been adopted into the select family of valuable furs, closely preceded by marten and latterly followed by fisher and cross fox. To take the place of mink as a coat lining, muskrat was chosen, sharing this promotion with some less valuable European furs. To supply the demand for a medium priced black fur of beauty, the skunk has been chosen and named Alaskan sable. The black domestic cat is also utilized to meet the demand for black furs, while Northern hares are extensively utilized as "Baltic fox", "White fox", "Black lynx" or "electric seal."

And so all this brings us down to present day conditions and fur farming. As far as I can see the editors of the financial weeklies and dailies have always been anything but favourable to fur farming. Whether this is because they really believe fur farming is not safe, or for some other reason, I am not

Webster On "Morale"

MORALE (*Mo-ral*) *n.* (F. See *Moral*, a) the moral condition, or the condition in other respects, so far as it is affected by, or dependent upon, moral considerations, such as zeal, spirit, hope and confidence; mental state, as of a body of men, an army, and like.

HAT is Dr. Webster's definition. Many of us know the word only in its war-time application.

Webster dwells firstly upon the usage of the word "morale" as applied to the common-place happenings of every-day life. His allusion to its reference to an army comes later. And Webster is correct—meticulously so.

It was their private-life morale that made such splendid soldiers of our boys when the time came for them to don the khaki. It was that, and that alone, that made them take the first step, and it was that which carried them through to victory. If their every-day morale had been neglected, the Army could have done little with them and success would not have crowned their efforts.

It is the many little incidents of your daily routine that make up your morale—the morning shave, your clean linen, polished shoes, brushed clothes. Webster speaks of zeal, spirit, hope and confidence. It is by attention to the small details of your personal appearance that these may be attained.

The Gillette Safety Razor enters as much into the morale of every-day life as it did into that of the trenches. It helped our soldiers to maintain their confidence and bearing. It will do the same for you. The Gillette Safety Razor makes the daily shave come easy—there is no pulling or scraping—no honing, or stropping—just five minutes of perfect shaving comfort. And, afterwards, a chin that tells of morale and self-respect.

Sold at most stores catering to men's needs.

prepared to say, but believe in most cases it is the former. Very few people understand the fur business and trapping, and everyone who does, I will venture to say, believes fur farming when properly conducted will make money for those who undertake it. The author of this article has hunted and trapped as well as bought and sold furs for years and I really believe the fur farming business in Canada will in the near future develop into a large and profitable industry. We must understand, to begin with, the habits, likes and dislikes and in fact the general characteristics of the animals which are not yet thoroughly understood except by old trappers. Moreover much of the stock is wild and it must be semi-domesticated before results begin to show, or if not this, produce on a large scale along natural lines and not have the animals domesticated at all. In the beginning of the fur farming era, thousands of dollars were made as well as lost, but these were the days of exorbitant prices and speculation and now having passed, the industry is on a firmer foundation.

Any enterprise that can pass through a trying time such as this war has caused and remain on its feet shows signs of a rosy future.

I know several fur farms that are not only on their feet, so to speak, but have paid good sound dividends as well.

Editor's Note—In connection with the demand for furs it is interesting to note that while beaver was the principal fur first exported, yet bear, otter, wolf, marten, lynx, fox, mink, raccoon and muskrat were all used in considerable quantities as early as 1750. The South American chinchilla and the domestic house cat were added to the list around 1843, and opossum and fur seal in 1849. Skunk were not exported until 1858. Even then the supply of the other and more valuable furs was beginning to diminish and at the present time every animal with any fur value at all is being used. Rabbits, ferrets and brown weasels with a small value are all marketed in huge quantities. Groundhogs and the American squirrel are not fur bearers, growing hair only, but the chances are that there will be a demand for them also within a few years. With no new species to draw upon and the most inaccessible portions of North America being rapidly penetrated fur farming offers the only solution of the problem of supplying the ever growing demand.—H. C. H.

A Winter in New Ontario

FRED A. CLARKE

AFTER twenty-two months spent in a military hospital I left London, Ontario, on the twenty-eighth of September last, arriving at Savoff, New Ont., on the second of October, and as there was no one there to show me my duties of running the gasoline engine that pumps water into the railroad tank, I took a good look around to see if there were any signs of game or fur bearers. There were, I found, a few tracks of fox, fisher and lynx, but of muskrat, beaver, otter, skunk, coon and mink there was never a sign.

Moose seemed to be fairly plentiful according to the trails and fresh tracks I saw every time I went out. However as I had only a Baker shotgun, moose meat was out of the question. About the end of October I heard that game and fur were plentiful at English River, so I asked to be moved to Ogahalla some three miles from it.

Arriving there I found that I had jumped out of the frying pan into the fire as there was

not a sign of any fur at all, though moose were in fair numbers. However, MacDonald, a trapper well-known around these parts, had made some very good catches so I had hopes of pinching some stragglers. The snowshoe rabbit is sure a scarce article. It is claimed that some kind of a mite eats into their ears annoying the rabbits so much that they soon die.

In looking the place over I found that all around the bush had been wiped out by a bush fire, however, there was a ravine some three hundred yards back of the station that had odd trees here and there that were still green. This ravine connected two fairly large strips of timber some distance each side of the station so I planted a dozen number one and a half Victors for any animal that might use the ravine.

Having set and baited on the fifteenth I did not catch anything until the twenty-fifth. That morning I found two mink and two weasels handcuffed and patiently waiting. I

also learned that I was up against a fox that knew what a trap was, but as he would take bait things looked hopeful. Some three days later I caught a fair sized red fox, but it proved not to be the trap robber.

After trying every set that I had ever tried before or ever read about I finally went after him this way. Taking up one of my other traps I placed it about two feet back and to the left of the hole I had dug in the bank, then placing a number O Victor tight to the other side of the hole in plain view I tossed a fish back in and awaited results.

Two days later I had the fox. He had gone in and secured the bait, but was caught by a hind foot as he backed out. This was on the fifteenth of December and catching nothing but the so-called whisky-jacks, the remainder of the month I sort of lost interest.

On New Year's Day not having any pumping to do I took a stroll out to the trap line and found that two fur animals had gone west through the ravine, but the traps were too deep under the snow for a catch. Having no bait but canned salmon I used a can of it, then on the sixth of the month in going the rounds I came to the last trap and there dangling on the end of the balance pole was a marten. Marten look as though they might

be tamed, and if so it would certainly be very interesting trying. About ten days later I came around the side hill to this trap and was trying to think how many cursed whisky-jacks I had caught when I noticed that there was something doing. There was a fisher caught by the hind foot and as the pole wasn't heavy enough to lift him up it kept him going around wheel-barrow fashion. This animal was just the opposite from the marten and I don't think the devil himself could tame a fisher. The pen was flat and some farmer will have about ten square feet of cleared land to start on. He often bit at his front feet while he was moving around. I stretched him on the fox board and he was fifty-five from tip to tip, thirty-eight in the hide, seven and a half at the hips and six and a half at the shoulders. I shipped to Shubert and received \$45 for it, \$23 for the marten, \$21 for the large fox and the rest were bought by a traveller for \$36. I received \$90 per month on the tank job so my winter in the north for the good of my health proved profitable in other ways as well.

Perhaps the editor will put this contribution in the waste paper basket, but we trappers have to take chances.

(Perhaps he won't!—H. C. H.)

Queries and Answers

Query—I want a complete trapper's guide in book form, showing a variety of methods of setting traps, also deadfalls, snarls and general information in regard to trapping. Will you please let me know if you have such a book and also the price.

C. A. L.

Toronto, Ont.

Answer—I think either Science of Trapping or Steel Traps would suit you, or both, if you can manage it. You can secure them from the offices of *Rod and Gun*, Woodstock Ont., price \$1. each.

H. C. H.

Query—Please tell me of some kind of scent to use to draw coyotes to bait where I have my traps set. They will come within ten feet of the traps, but no closer.

T. F. J.

Juanita, Sask.

Answer—Frankly I do not think there is any scent that will do this. If there is I have never met it, and I have tried them nearly all.

Without realising it you have discovered the chief characteristic of the coyote, namely the intense wariness that is the great drawback to successful trapping. Let us examine the query again. The coyotes come within ten feet of the trap, but no closer. Now, believe me, that is all that any scent could be expected to do. If we are to believe the advertisements of some of the scent manufacturers their lures will cause the animals to lose all their natural cunning and to throw discretion to the winds by going crazy over the scent. As any man will tell you who has given the matter a thorough trying out, this is absolutely misleading. In very cold weather when the bait is frozen it gives off very little smell, and at such a time an animal can pass by without finding it. Under such circumstances a non-evaporating, non-freezing scent will help attract the animal's attention to the bait. Generally speaking that is all that a scent is expected to do. In a few cases a scent can be used *without* bait in such a way that the animal gets caught while trying to locate the scent.

What Every Sportsman Should Know About Canvas

Every man who enjoys outdoor life—camping, hunting, fishing, etc., should know about the greater protection and increased service that may be had by using PRESERVO-treated canvas. For experience has shown that untreated canvas does not provide economical weather protection because it is not waterproof against any but the slightest rains.

Moreover, untreated canvas is short lived, moisture soaks into the fabric, mildew forms, causing decay and rapid disintegration.

PRESERVO is a scientific, soft finish waterproofing of unsurpassed preservative qualities. Canvas treated with PRESERVO at once becomes **waterproof, mildew-proof and rot-proof**, and, best of all, will wear at least twice as long as untreated canvas.

In fact, PRESERVO has given such universal satisfaction that it is recognized as the standard soft finish waterproofing for canvas.

PRESERVO is inexpensive and easily applied to new canvas or old canvas. You can be assured of satisfaction by having your tents, ground covers, bed-rolls, pack-saddles, canvas wearing apparel, duffle bags, supply covers, etc., PRESERVO-treated. Add new life to your old canvas by treating it with PRESERVO. Almost any canvas goods dealer can supply you with PRESERVO-treated canvas or with the liquid PRESERVO.

Insist on PRESERVO

While there are other methods of waterproofing canvas, there is only one PRESERVO. You can insure maximum service and economy by insisting on the genuine.

Write us about your canvas needs and let us tell you about the saving you can make by using PRESERVO-treated canvas. Ask for our special book for campers and sportsmen.

If the coyotes come within ten feet of the trap it is obvious that they have already discovered the bait, and we are then faced with two alternatives. Either they are not hungry or else, which is more likely, they are suspicious or the set. If this is the case scent will not help matters.

Bait should be used very sparingly in coyote trapping. While they are always on the lookout for odd scraps, yet a chunk of skinned meat will always arouse their suspicions and it is then an easy matter for them to locate the traps.

Try setting your traps twenty or fifteen feet from the bait, if possible between two clumps of grass so that the coyote has to cross them to reach the bait. If you examine their tracks you will find that they will circle the bait several times before approaching it, and a trap some distance from the bait is jammed close up against the bait, which is just where the coyote is looking for it to be.

The most successful way of trapping them is at a carcass, but be sure that they have started to feed there for a night or two before setting your traps. Around such a carcass there are always trails that they use and these furnish good places to set traps. Also you will find tufts of grass, a rock or bone or something similar where they leave their body scent in the same way a dog does, and here again a trap will usually make a catch. Sets like these are blind, that is set without bait and carefully concealed.

Where you have no carcass and can find no trails that the animals are using it becomes necessary to use bait and at once the animal's suspicions are aroused. Try setting your traps in the form of a square about six to ten feet each way. Bed them down solidly, putting a little piece of wool under the pan, and cover lightly with the natural surroundings. Then go away for a week before putting the bait in the centre of the square. If you can ride up to the spot on horseback and drop the bait on the required spot without dismounting you increase your chances of success. Coyotes are not impossible to trap if you can eliminate the human scent and sign.

When using bait avoid having one too big. A few feathers, a chicken wing buried in the earth with the tip protruding are more potent as lures as they arouse the animal's curiosity without awakening its suspicions.

There are a number of scents more or less attractive. One is to chop up half a pound of

beef during warm weather and place it in a sealer until it has become thoroughly decayed and the odor as offensive as possible. When this has taken place add a quart of some liquid animal oil, half an ounce of asafoetida dissolved in alcohol and one ounce of tincture of Siberian-musk. If you cannot get this the common musk used for perfume can be substituted, or an ounce of beaver castor. Mix thoroughly and bottle securely.

This scent was introduced into Michigan by the U.S. government, and has been very successful.

If you can shoot a coyote or catch one always save the urine. A few drops of this on a tuft of grass in the centre of a square of traps will often prove more deadly than a meat bait.

H. C. H.

Query—As I am a reader of Rod and Gun I wish to ask a favour of you, as to whether or not the Hudson Bay Co., hires men to trap for them, and will, if you guarantee to give your furs to them, furnish the traps and pay you a good day's wage (please state the wages). As an old trapper told me this, I wish to find out if it is true or not. I have done some trapping here but fur is very scarce and as I am a lover of the wild I wish you could help me out. Have been discharged from service and wish to start good on the old game.

A. L. N.

Leominster, Mass.

Answer—I am afraid that the old trapper that told you this has been "putting one over you." I have never heard of the conditions of which you speak. Actually what the Hudson Bay Company does in the north with the Indians is to advance them an outfit—food, traps, ammunition, clothes, etc., up to a certain amount. This is called the Indian's "debt" and he is given so much, depending on his reliability, skill and so on. He is bound to bring his furs to the post that outfitted him, else the Company blacklists him. Whatever furs he catches of course are credited to him at the usual rates and after he has paid off his debt the balance of his credit can be used in any manner he likes. Stewart Edward White, the American novelist wrote a very interesting book "The Silent Places" that dealt with an Indian that jumped his debt and the lengths that the Company went to catch him.

As far as I know the only trapping that is done on a day-wages basis is on some of the muskrat marshes of the Eastern States. Here

some of the owners of the marshes will sometimes hire men to trap the rats which are very numerous and strictly preserved against trespassers. The trapping game is more of a gamble than a cinch at the best of times, and to offer a man wages for all the fur he could

catch would be a very risky proposition.

Fur is getting scarce all over now compared to a few years ago, but there are still some good vacant districts if a man is rustler enough to get out and look for them. There is no other way of finding them.—H. C. H.

Champion Cadet Corps Team Wins Dominion Championship

(Dominion Marksmen's Review)

THE New Glasgow Cadet Corps led all other teams in the Dominion Championship with the magnificent score of 2729 out of a possible 2800, or a team average of 97.4 per cent. During the match 12 possibles were made. Ernest Williams was responsible for three of these, only dropping two points out of 280, or 99.2 per cent. Five members of the team shot over 98 per cent. and eight over 97 per cent. Calgary, as usual, shot very well—their total being only two points below that made in the Provincial Match and 56 points behind New Glasgow. But evidently the New Glasgow boys were determined that the team winning the Dominion championship would have to set a higher standard, and the record they have established in this match is likely to stand for some time.

As was expected, nearly all the teams showed a general improvement in their scores—possibly the shorter range made it easier for some—but undoubtedly good, hard practice and less nervousness had a great deal to do with it. A letter was received from Fraser MacDonald of New Glasgow, a few weeks before the match, stating that his boys were working hard and intimating that they would give the teams from the other provinces a good run for the championship; but truthfully speaking, we did not think they would better Calgary's previous record.

These championship matches have been a decided success, and have been the means of creating a much wider interest in our marksmen scheme.

It is unfortunate that Ontario was not represented in this competition on account of so many of the London team being away.

1st Nova Scotia, New Glasgow Cadet Corps.....	2729
2nd Alberta, Calgary High School C.C....	2673
3rd Saskatchewan, Regina Coll. Inst.....	2657
4th New Brunswick, Rothesay Cadet Corps.....	2601
5th British Columbia, Victoria High School.....	2531

6th Quebec, Westmount Boy Scouts..... 2319
Ontario defaulted.

Dominion Marksmen have certainly proved by their records in the Provincial and Dominion Championship matches that they can hold their own with anyone with a .22 rifle at 20 or 25 yards. Better scores have been made with telescopic sights, but we firmly believe that the New Glasgow Cadets have established a record for boys of their age under the conditions of these matches.

Next year it is hoped that the Championship of Dominion Marksmen will more truly represent the championship of Canada. We believe it does now, but there are surely a lot of Cadet Corps and Rifle Clubs in Canada that should be shooting with Dominion Marksmen. Do your best to interest your friends in this organization. Every boy has the desire to shoot, but some have not had Dominion Marksmen explained to them. We want a hundred new clubs next year. Canada is the hunting ground of this continent, and if we are to enjoy the woods, lakes and mountains that nature gave us to hunt in we should learn the game young. If every Canadian boy took advantage of the opportunities that he has to hunt we would be a better nation, physically and morally.

CH. SHANNON BANDIT A.K.C. 163108.

Attention is drawn to the advertisement of the Haig Kennels of Kitchener, Ont. in which they announce that Ch. Shannon Bandit the beautiful "combination" beagle is offered at stud. This dog is one of the most successful on the circuit and breeders are fortunate in being able to secure his services. Bred from the greatest producing families on both sides of the house Bandit is bound to produce that strain that delights the beagle fan. He stands fourteen inches, has a rich tan head and possesses the good qualities of a beagle of the famous Johnson blood. Bandit commenced his career as an eight months puppy and completed his championship at fourteen months. He was whelped January 8, 1912.

Autumnal Musings

Robert Page Lincoln

The fading year hath reached a gloried prime,
Declining days bow down its massive head;
The hardy fruit more luscious gleaming rime,
Bears sweet recall of summer hours now fled.
The yellow pumpkins dot the sleeping field,
Telling the riches of the long-run vine,
The shocks of corn tell too a bounteous yield,
Upon the brace stalks heavily recline.
Hushed in a thicket breathes a newer note,
Half whispering, half trembling steals abroad,
And shy conversings from the dry reeds float,
Upward, away, across the withered sod.....
A raucous cry comes from a wildfowl throat:
The V-clans rise where the marsh rushes nod.

His storehouse fashioned in the gnarled oak,
The frisking squirrel now loads to overflow,
Divining winter with his jeweled cloak,
Descending in a silence charged with woe.
The thornapples have swelled in full maturity,
And dusted black-haw globes are hanging
near,
As if in wait for one to set them free,
With eager hands, the soul of autumn's cheer.
In tangled brakes the pregnant hazel shells,
Await the picker's welcome ringing shout,
And to a noisy tread upsprings in barren dells,
On thunderous wings the banded quail in rout;
And any who would wander by the fells,
Might hear the partridge drumming autumn
out!

IMPORTED GOODS ARE NOT ALWAYS

GALT, ONTARIO 1375

HOW TO MAKE A TOBACCO JAR

Get a small pumpkin with a very hard skin. Cut off the top and scoop out the inside, taking care, however, to leave it about $\frac{3}{8}$ "

22 CALIBRE CARTRIDGES
12 GAUGE SHELL AS A KNOB

thick as it will shrink a lot. Leave it to dry for at least a month.

For the legs use empty cartridges, I used three .410.

Cut them so that they fit the sides and glue a piece of wood inside each, then screw them into place, as shown in the illustration. Next get a tin or a jam carton (as I did) that fits

inside and will come flush with the top, then shave the top of the pumpkin until there is room between the tin and the outside skin to squeeze .22 cartridge cases in all round. The lid can be made of a piece of tin cut to fit the rim of the jam tin, with the brass end of a 12 bore cartridge soldered on for a knob.

A HANDY PACKSACK

The first sketch shows a snowshoe with arm loops attached. The second drawing shows a back view with gunny sack attached.

This handy pack sack is made out of an old snowshoe and a gunny sack. It is a handy pack for the trap line, as when taken off, the heel of the snowshoe can be stuck in the snow and it will remain upright.

The **Why?** of Another Victory Loan

The answer to the question "Why does Canada need another Victory Loan?" divides itself into two parts.
(a) To finish paying the expenses of demobilization, and the obligations we still owe to our soldiers.
(b) To provide national working capital.

Obligations to Soldiers The obligations to soldiers include:
That already incurred cost of bringing home troops from overseas.

The payment of all soldiers still undemobilized. This includes more than 20,000 sick and wounded who are still in hospital.

The upkeep of hospitals, and their medical and nursing staffs, until the need for them is ended.

These three items alone will use up at least \$200,000,000 of the Victory Loan 1919.

Gratuities The gratuity to assist soldiers to tide over the period between discharge and their re-adjustment to civil life, calls for \$61,000,000 in addition to the \$59,000,000 already paid for this purpose out of the proceeds of the Victory Loan 1918.

Land Settlement Soldiers who desire to become farmers may, under the Soldiers' Land Settlement Act, be loaned money by Canada with which to purchase land, stock and implements. The money so advanced will be paid back; meantime each loan is secured by a first mortgage. Up to August 15th, 29,495 soldiers had applied for land under the terms of this Act; and 22,281 applications had been investigated, and the qualifications of the applicant approved.

Vocational Training For this work which, with the Vocational Training and Soldiers' Service Departments, embraces the major activities of the Department of Soldiers' Civil Re-establishment, an appropriation of \$57,000,000 is necessary.

National Working Capital Canada needs national working capital, so that she may be able to sell on credit to Great Britain and our Allies the products of our factories, farms, forests, fisheries and mines.

The magnitude of these orders and the amount of employment thus created, will depend upon the success of the Victory Loan 1919.

The "Why" of Credit Loans Farmers and manufacturers (and that includes the workers on these orders, must be paid cash for their products. Therefore, Canada must borrow money from her citizens to give credit, temporarily, to Great Britain and our Allies. Actually, no money will pass out of Canada.

If Canada does not give credit, other countries will; and they will get the trade, and have the employment that should be ours, to distribute amongst their workers.

For Transportation Money must also be available to carry on the nation's shipbuilding programme, and other transportation development work.

For loans to Provincial Housing Commissions who are building moderate priced houses.

These, then, are some of the things for which Canada needs national working capital. She is in the position of a great trading company, and her citizens who buy Victory Bonds are the shareholders.

Those who give thought to our outstanding obligations to soldiers, and to our need for national working capital, cannot fail to be impressed with the absolute necessity for the

VICTORY LOAN 1919

"EVERY DOLLAR SPENT IN CANADA"

Issued by Canada's Victory Loan Committee in co-operation with the Minister of Finance of the Dominion of Canada

Ontario Rifle Association Matches, 1919

J. W. SMITH

AFTER a lapse of four years, the Ontario Rifle Association resumed their Annual Matches with a four-day meet commencing on August 19th and ending on August 22nd. The decision to hold the meet this year was not made without some misgiving, the Executive Council realizing the difficulties which would be encountered owing to the complete change of conditions caused by the war. The Long Branch Ranges near Toronto had been practically in disuse for a period of five years, and needed a thorough overhauling, the railways refused their usual concessions in the way of reduced fares to outside competitors, register-keepers and markers were hard to get, and numerous other obstacles presented themselves, which would have to be overcome. Nothing daunted, however, the officials of the Association, having made the decision, set to work, and the opening day found everything in readiness with over 200 entries, as compared with about 350 in pre-war meets. The satisfactory accomplishment of these preparations was due to the tireless energy of individual members of the Executive Committee, particularly Lieut.-Col. S.J. Huggins, who carried out his arduous duties as Secretary in a very capable manner. Whilst the register-keeping and marking undoubtedly left much to be desired, and the rules and regulations were not so strictly adhered to as might have been, the consensus of opinion was that the shoot was a decided success, and would pave the way for a banner meet next year.

The weather conditions during the shoot were not favorable for good marksmanship. The first day was showery with a variable wind, and a heavy thunderstorm interrupted proceedings for an hour. The second day was fine, and the best of the four. The third day opened dull and threatening, and a rising wind soon brought a driving rain with it which made conditions extremely difficult. The closing day was fine, but wind and light were tricky, and needed very close watching. The writer himself, after placing six consecutive bulls at 600 yards in the Tait-Brassey Match finished up with a magpie owing to an unnoticed lull in the wind, and many other marksmen of more experience were caught in the same way.

Those competitors who came from long

distances to take part in the Matches under heavy expense to themselves are to be heartily commended on their enthusiasm, as their presence assisted materially in making the meet representative of the best shooting talent in the Province. Strong contingents arrived from Ottawa, Kingston, Hamilton, London, Guelph, and St. Thomas, with smaller ones from Woodstock, Brantford, Port Hope, Grimsby, and Bowmanville. They were accommodated with marquees, tents and bedding on the Ranges at a nominal charge. A number of returned veterans from the convalescent hospitals in Toronto also took part in the matches, and their success was a source of satisfaction to all concerned. Among these was Sergt. F. S. McCoy, a one-legged hero of the 19th Battalion, who was wounded on November 10th, 1918, the day before the Armistice. Sergt. McCoy hails from Hamilton, and won the Duke of Cornwall and York Match with the possible score of 70 points, after a shoot off with two other competitors. The West was represented by Lieut. J. Macklem, of the 29th Saskatchewan Light Infantry, and Mr. Frank Morris, of the Dominion Cartridge Company, Edmonton, Alta.; a marksman of note who has been to Bisley six times. Other famous riflemen noted on the Ranges during the meet were Sergt. Galvin Russell and Sergt. W. A. Smith, both of Ottawa, the three Barrett brothers of Kingston, Capt. C. R. Crowe of Guelph, Maj. W. C. King of Bowmanville and Capt. A. Pain of Hamilton. Toronto riflemen included Sergt. W. A. Hawkins, winner of the King's Prize in 1913. Lieut. W. L. Dymond of the Canadian School of Musketry, Lieut.-Col. A. Elliott, Q.M.S. W. Davidson, S. S. H. Kerr, and Sergt. T. Bayles.

At the general meeting of the O.R.A. held at the Ranges on the evening of August 20th, several interesting points were discussed. The prospects of a free issue of rifles and ammunition to properly organized and gazetted civilian rifle associations was referred to, and the apathy of the Federal Government in this respect was deplored. It is understood, however, that civilian associations will receive recognition as soon as the militia regiments have been re-organized and rifle clubs everywhere in Canada are

only waiting for this event to resume their pre-war activities. Strong hints were made that the Ross rifle was slated for discard in the near future as the Canadian military small arm, and a rifle of British manufacture was destined to take its place. It was stated that this rifle would possess the qualities which would place it in the category of a first-class target weapon, and, at the same time, its construction and mechanism would be such as to stand the rigors and hard usage of actual warfare. The adoption of a standardized rifle of British make would do away with the discrimination experienced by the Canadians at Bisley in previous years with their Ross rifles, and would place all competitors on an equal footing. The general feeling of those present at the meeting towards the conditions which prevailed at Bisley this year was unmistakably one of derision. It was felt that shooting with a battle rifle and under battle conditions was no true test of marksmanship, and that this form of musketry should be confined to regimental practice. In other words, national and other big rifle meets should be conducted on lines involving the use of slow fire with a high class rifle and sights, at a well-defined mark, whilst rapid fire contests at figure targets with battle rifles and sights should be confined to the purely military class of rifle-shooting. The first brings into play the very highest standard of scientific skill and judgment in marksmanship, but the element of luck enters largely into the second style, and a sharp dividing line should be drawn between the two. Any man who is an average shot at slow fire can soon be trained to the same degree of marksmanship on rapid fire at an indistinct mark without windgauge, besides which, the former class of shooting has a greater fascination, and will tend to attract more recruits and devotees of the sport to the ranges. Opinion will, undoubtedly, vary on this point, and the writer is merely reporting the almost unanimous view of those present at this meeting.

Practically nothing was heard of the Irish Rifle Association in the newspaper reports of the Matches, and it is only fair to this well-known organization to record its activities and achievements in the shoot. Earlier in the season, such members of the I.R.A., who were not already identified with some militia regiment, proceeded to take this step in order to qualify themselves for the military events and the Militia Aggregate. Consequently, the members were scattered through-

out the various Toronto regiments, and competed with their respective units. No fewer than 55 members of the I.R.A. took part in the matches, and made an excellent showing, the following appearing at least once among the first ten competitors:— W. L. Dymond, A. J. Slatter, W. A. Hawkins, J. E. Fitzgerald, J. W. Smith, J. Lonsdale, S. Dean, J. Umpherson, T. G. Beatty, R. G. Freeborn, W. Reid, G. Lambton, R. J. Reesor, W. A. Brodie, Col. A. Elliott, H. Carey, A. Emo, R. Storrar, G. W. Bull, A. R. Humphreys, R. Edmond, and T. G. Margetts. In addition to this, the I.R.A., carried off nine out of the first thirteen places in the City of Hamilton Tyro Match including the first four, and captured eight places out of the first twenty in the Ottawa Aggregate. The 110th Irish Regimental Team which won the Presidents' Match for Tyro Teams by the handsome margin of 64 points were all I.R.A., men.

Space does not permit of a detailed description of each match, but a few exceptional scores deserve special mention. Possibly those of Lieut Marks and Sergt. Russell in the Tait-Brassey Match were the most remarkable considering the weather conditions under which the match was shot. Both are Ottawa men and returned veterans. The possible of 50 points scored by Lieut. S. W. Graham of the 48th Highlanders, Toronto, in the Bankers' Match was also a notable performance. Lieut. Graham served 4½ years in France with the "Ladies from Hell," winning the Meritorious Service Medal. Sergt. J. Steele, who won the Lieutenant-Governor's Match, hails from Guelph, and Private G. Weir of the Q.O.R. who won the Gold Medal in the resultant shoot off, is manager of the London Guarantee and Accident Company in Toronto. Private W. Gault of Ottawa, winner of the four Aggregates, is conceded to be perhaps the best shot in Canada to-day, and his shooting was all the more remarkable in that he ranked as a tyro for the meet. Another feat worthy of mention was that of Sergt. W. A. Smith of Ottawa, the well-known Bisley Marksman, in scoring two possibles in the Extra Series on the difficult range of 300 yards at a six-inch bull's-eye. Only three possibles were recorded at this range, the third being that of Pte. R. Edmond, a marksman recently arrived from Australia, and now with the 12th York Regiment and I.R.A. of Toronto.

The targets used for the 200 and 300 yard ranges were four feet square, black bull's

Detroit, Mich.

eye (on white background) 6" in diameter, with "inner" and "magpie" rings 15" and 24" in diameter respectively, the remainder of the target constituting the "outer." Targets of similar description were used for the 500 and 600 yard ranges, the dimensions being 20" bull's eye, 32" "inner", 48" "magpie," and six feet square. The one exception was the Macdonald Rapid Fire Match at 500 yards, when a figure target was used, the figure being khaki-colored on a green and white background. The Ross rifle was in use presumably without exception, the writer did not see or hear of any other. Ammunition issued was the 1915 Mark VII. pointed Service Ammunition, and no complaints were heard regarding its accuracy. Slings not exceeding 54" in length were permitted, but fixed or artificial rests were barred, and the minimum pull for the trigger was 5 lbs. The following lists show the leading scores, but are not complete owing to lack of space. The Ottawa Aggregate has no prizes attached, but was compiled for the D.R.A., at Ottawa, and it is understood that the first 40 or so competitors will be asked to shoot for a place on the Bisley Team next year.

City of Hamilton Match Open to Tyros only. 7 shots at 500 yards, deliberate. Possible Score 35 points.

The Airedale as a Pal and a Worker

M. U. BATES, Metagama, Ont.

BUT a very few years ago when the out-of-doors man went in to any extent for variety shooting and hunting, it was necessary for him to maintain a sort of young Zoo to contain what was then, as it is to-day, one of the most essential parts of his outfits, his hunting dogs. If he hunted ducks he'd have to have his Cocker, his Retriever, his Chesapeake Bay or some other sort of bird

dog. When he went out in the "open places" for a week to try his luck at a deer or moose, he had to change oif to his fox or deerhounds; and if it were very bitter weather, and he were far back, he'd have to take along a husky or two to haul out his game and move his tents and other camp equipment. If it were earlier fall, and in a bear country, he'd also have to move around

THE LARGEST IN OUR LINE
IN CANADA

a small army of noisy fox terriers; and if there were a possibility of a coon or two about, and he wanted to take in all the fun there was going, he'd also have to have along one of those "coon" dogs, whose pictures we used to see, when we were young, in the National Sportsman.

When the winter came, if he followed the trap-line any, he'd have to express all the other varieties away to a boarding-school for the winter, and call on his huskies again, and in addition (if he went in for a little surreptitious sport at times), another little cross-bred, known as a "beaver dog."

To the sportsman of means, all these various chances meant no small amount of inconvenience and annoyance; to the one of ordinary means, it was practically an impossibility; and except those times when his "wife's brother" came out from the city for his annual hunt, there certainly wasn't very much ease in it for him.

The advent of the Biggest and Best, however—the sporting Airedale Terrier—thanks to the discernment and untiring efforts of the pioneer fanciers of the breed in this country, has effected a marked change in these conditions. He might, indeed, appropriately be called "The Twelve (or Twenty) in One," for the adaptability of this remarkable breed seems almost limitless, and is unbelievable by those who have not had the opportunity, or inclination, to study him closely. His prowess in the big game fields, working on deer, moose, or bear; his peculiar fitness for any kind of land and water retrieving; the singleness of his affection as a pal, and his efficiency as a guard, either of person or property, has been commented on so often of late in our sporting magazines that it needs no further mention from me here.

The writer, who has had several year's experience in the big game fields and on the trap-line, has had unusual opportunity to observe and study the character and development of this breed under different conditions; and what he has found most striking in them is the almost human intelligence they quickly

develop when restricted for a time to the companionship of only one master.

Taking for example one big, black-backed sixty-pounder which I have in my kennels here. This dog has hunted moose and deer with me, has worked on ducks and geese during the fall, and in the winter has hauled my sleigh and led my other dogs ten times better than any husky I have ever seen. During the fall, when the "porkies" and other "varmints" were moving around, he got into the habit of sleeping with his nose to the door of the tent, and it is his invariable custom now, either in tent or camp, to sleep this way, and woe betide the four, or two-legged creature who would approach in the night unannounced.

Another acquirement of his is to find the way back to camp at night when either darkness or storm has wiped out all trace of trail and landmark. I have seen him looking back every few yards to see if I were coming; do this when the snowshoe trail made in the morning was buried under two feet of snow; and have seen him, while hauling a heavy load, work out a bush trail over which he had travelled only once, three weeks before—this, too, after several heavy snowfalls had effectively blotted out all visible trace of it.

More than once, in this way, he has saved me an unpleasant night in the bush, when my enthusiasm during the clear, cold days of early winter had led me, travelling without snowshoes and following the fresh trail of fox, fisher or lynx, many miles farther back from my regular routes than I should, properly, have undertaken.

An old Hudson Bay Indian, seeing one of these hunting bitches working at a trapped fisher one day, declared after watching her for some time, that he could take two such dogs and make a good winter's catch on lynx, fisher and beaver, without so much as a single trap—the dogs treecing the lynx and fisher and "trenching" the beaver, where they soon fall an easy victim to the deft hand of the trapper.

The Pointer

THERE are reasons for believing that the pointer has descended from the hound, or, at any rate that it has hound blood in it. It has been said by old writers to be a foxhound searching for game by scent, repressing his cry of joy when he finds his game, and assuming an attitude of "point."

In the present day the resemblance of the pointer to a fox-hound is small compared to that of eighty, or one hundred years ago. About eighty years ago most of the pointers are said to have been white or varied with liver-colored spots.

PATENT PENDING

were black and these were supposed to be endowed with an exquisite degree of scenting powers. The black pointers of the present day are, in all probability, descendants of this famous strain.

Spanish, Portuguese, French and Russian pointers have been referred to by the early writers. The Spanish pointer is described as a big heavy built dog with large ears and a badly formed body. He had large feet and was too slow, though it is said, he had acute scenting.

The present breed of pointers have been derived largely from the Spanish dog of this breed.

However, it is not within the scope of this small work to enter into an account relating to the history of the pointer, it being sufficient herein to indicate the principal points indicative of a typical or fairly typical specimen of the present up to date pointer.

First of all, as regards color, this is more a matter of individual taste, though the writer thinks that most judges are inclined to favor a white dog with liver colored markings, nicely distributed. This even distribution of markings lends additional quality to the otherwise good dog but it must be understood that such is neither essential or of much significance.

Lemon and white is esteemed but black pointers appear on the show bench, although there does not seem to be much inclination towards favoring this color. Brick red and white are not uncommon. A perfectly white body with symmetrical workings on the head and ears looks very handsome, many points are "ticked."

A medium sized dog is preferred by judges to one either too large, or undersized. A typical specimen should show one A.1. quality all round.

The eyes to be of medium size, the ears small thin and covered by fine soft hairs, and carried close to the side of head, nose, broad and full with widely dilated nostrils favoring scenting power. Lips, thin but jaws must not be undershot or the lips pendulous.

The skull should be of medium width across the occiput, wide from eye to eye, and of good length from the level of the eye to the nose. The whole facial expression should neither be one of heaviness nor yet of snappiness. Many pointers are much too heavy in head.

To the fore and hind limbs, carriage and

action of the pointer, judges pay particular attention.

The chest must not be broad, otherwise it destroys freedom and pace of movement in front, oblique muscular-though not loaded—shoulders, and long, clean, big-boned, thin-skinned, bare-footed limbs are points of excellence.

Big feet, straight shoulders and lightness in bone constitute defective points. Well-sprung ribs and great depth of girth are "sine qua non."

Tail-tapering, covered with thin skin and fine hair. It must not show any tendency towards the hound carriage but must be carried on the same plane as the back. Hocks strong and straight neither turned in or out (both are faults) elbows close to side.

To be typical, a pointer should display well developed muscles, elasticity of step and plenty of action in all his movements.

Lad—A Dog

Albert Payson Terhune, the author of "Lad: A Dog," has combined twelve stories which—originally appeared in different magazines into a charming, continuous story of the adventures of his thoroughbred collie, Sunnybank Lad. That the author both loves and understands dogs is plainly evidenced in these interesting stories. The wonderful intelligence, beauty, and courage of Lad will appeal to every dog lover, and these stories cannot fail to make those who do not own dogs realize the companionship and devotion a "real" dog brings. "Lad" is a thoroughbred and his every adventure as related by Mr. Terhune shows this, also what training can accomplish. One story deals with the unerring instinct which carries a lost dog home from a distant city, and that after varied and trying experiences at a dog show—the bugbear of a thoroughbred's life. Another story deals with his experience with a copperhead snake. He was missed from his accustomed haunts and it was thought that he had crawled away to die in the woods, but after three days he re-appeared—thin, caked with mud, and utterly disreputable looking—but cured. He had buried himself in mud in the marshes and had trusted to this healing element to draw the poison from his wound. Each of the other stories will be found equally interesting. A copy of this book can be secured through W. J. Taylor Ltd. Publisher, Woodstock, Ont., the price being \$1.75.

Then you can eat a real meal

Leg weary from stumbling over logs and rocks, cramped and stiff from lying-in wait for him. Then, suddenly, there he is. Bang! Got him!

Now for a nice juicy steak with gravy thickened with Klim, delicious flapjacks made richer by Klim, a piping hot cup of Klim-cocoa. Man, oh man, what a meal! The Chateau Laurier could offer you nothing like it.

Klim is the greatest little food improver you ever knew. Fresh separated milk reduced to powder so it takes up little space. Always fresh, just whip into water. Get a tin from your grocer.

Record Number of Shooters at Toronto Exhibition

Squad Shooting Big Feature of Tournament.

With the magnificent attendance of 103 shooters, the Canadian National Exhibition Tournament held at Toronto on July 26, 27, 28 and 29 proved to be the best Canadian Tournament held this year. The splendid arrangements whereby shooters were divided into four classes and with the additional good feature of having the monies guaranteed, the shoot attracted the leading shooters from Canada and the United States. American shooters came all the way from New Orleans in the South to Los Angeles in the East, while Canadians from as far west as Edmonton were present.

The cream of the shooters were on hand and the interested squad of top-notchers composed of Jennings, Wright, Huseman, Pendergast and S. G. Vance went from trap to trap breaking everything without a miss. Altogether they broke 500 targets straight which is a record for Canada if not for the United States.

Frank Wright of Buffalo, shooting consistently throughout the whole tournament was successful in carrying off the honours in the Canadian National Exhibition Handicap, the Doubles and was also the high gun for the entire shoot with the remarkable score of 666 out of 675. In addition he also took the Class A, Silver Trophy.

Six professionals were present for the shoot. They were J. S. Boa of Chicago; F. Morris of Edmonton; G. Dunk, Toronto; F. Huseman, Rochester; F. A. Wadsworth and L. Squire.

A well known Toronto shooter Mr. C. N. Candee had the honor of having the best score on the morning of the first day breaking 99 out of 100. Mr. Candee is in his 60th year. He was heartily congratulated on his wonderful score. In the afternoon of the first day, Woodward of Texas, Wright of Buffalo and Pendergast of Phoenix each succeeded in breaking 99.

In the doubles championship Frank Wright broke 48 out of 50. The coolest shooter in any of the squads was W. H. Singer of St. Catharines who went to the traps each time smoking his pipe. George J. Tuckett of Los Angeles, a former Hamilton shooter made a hit with the spectators with his easy manner of breaking the birds.

The weather was very good for the entire shoot and would have been ideal had it not been for the constant wind off-shore.

H. Pendergast of Phoenix, N.Y. was high man on the morning of the second day of the tournament breaking 74 out of 75. The third day of the shoot brought forth some wonderful exhibitions of skill with J. D. Clay of Houston, Texas, breaking a perfect 75 and ten others tied for second place at 74 out of 75.

Frank Wright of Buffalo broke his former long run record with the wonderful run of 333. His share of the money was \$317.00.

Fred Kerr of Crediton who did such good shooting at Chicago showed up remarkably well in the C.N.E. Handicap only missing one bird, and that at the last trap, at 17 yards. In this event fifty-one shot ninety or better, Frank Troch and Nicali were tied for second place with Fred Kerr.

C. N. Candee of Toronto won the Class B, trophy, S. H. Newton of Sherbrooke the Class C, and R. Stafford of Belleville the Class D, trophy.

The committee in charge are to be congratulated on the excellent programme provided and the splendid manner in which the tournament was conducted. Messrs W. H. Gooderham and George Cashmore acted in their usual efficient manner, Mr. Gooderham as manager and Mr. Cashmore as Secretary-Treasurer.

The Mallard

This most cosmopolitan of all ducks provides the keenest of sports for the Canadian hunter. Plentiful in the North West, but not so common in the East, it is a strong swimmer and hardy, often remaining all winter near the swift unfrozen streams of the north.

The Mallard, like most river ducks, is a surface feeder, but is also a quick diver. It comes well to decoys, particularly if one or two noisy birds are tethered with the "blocks." Overhead pass shooting of Mallards will put the sportsman to the extreme test.

To enjoy your trip after Mallards go well prepared against wet weather.

DOMINION

TELLS HOW FAR YOU WALK

THE AMERICAN PEDOMETER

Regulates to Step and Registers Exact Distances; Simple, Accurate, Durable.

Indispensable to every lover of outdoor sport and especially to those who love WALKING. Instructive because of value in determining distances; a necessary adjunct to compass and as useful to SPORTSMEN. It furnishes the true solution of many a disputed question of how far it is to or from various points. Best of all it is a wonderful health promoter because its interesting notations afford real incentive for WALKING. Whether you walk for health, business or pleasure—anywhere, everywhere, the AMERICAN Pedometer tells the whole story of just how far you have travelled.

FULLY GUARANTEED
One Hundred Mile Pedometer, \$2.25

Sold by all Dealers or Direct

ALBERTA PROVINCIAL ASSOCIATION.

Frank Troeh, led all contestants at the tournament of the Alberta Provincial Trapshooting Association, held at Banff, on July 14. He broke 164 out of 170. B. McLaren, of Calgary, was a close second, scoring 163. E. Brackney, Bellingham, Wash., and G. M. Cowderoy finished in a deadlock for third place on 161. For fourth place there was also a two-cornered tie, W. L. Freeman and J. McIntyre each breaking 158. F. H. Morris was high professional, beating his partner, C. F. Burch, 159 to 144.

The scores, at 170 targets:

SWIFT CURRENT (SASK.) CLUB TOURNEY.

At the registered tournament of the Swift Current (Sask.) Gun Club, held August 4 and 5, over their traps 45 amateurs and two professionals took part, shooting at 17,147 targets. The program called for 160 targets on each of the two days. On the first day P. G. Schwager, of Dundurn, Sask., and Harry Crabtree of Regina, turned in the high score when they dropped but 8 on the 160. R. G. Robinson, of Calgary, and B. F. Curtis of Saskatoon, tied for second on 149. R. L. Hutchinson, of Saskatoon, alone for third on 148, and Wade Owens, of Moose Jaw, and W. B. McLaren, tied for fourth on 147. H. W. Simpson of Calgary, fifth, going out with 146. F. H. Morris busted 146, and led C. L. Burch, who busted 127 for the professional honors.

The high amateur score on the second day was turned in by A. L. Allen, and was 151. Schwager was right at his heels with 150. McLaren busted 148 for third, followed by W. C. Jones, of Swift Current, on 144. Morris again outdistanced Burch, 143 to 129.

Schwager was also the high average man, busting 302 out of 320; McLaren, second, 295 out of 320; Crabtree, third, 293 out of 320, and Curtis, Chapin and Simpson tied on 289.

The scores.

National Sportsman

is a monthly magazine, crammed full of *Hunting, Fishing, Camping and Trapping* stories and pictures, valuable information about guns, rifles, revolvers, fishing tackle, camp outfits, best places to go for fish and game, changes in fish and game laws, and a thousand and one helpful hints for sportsmen. *National Sportsman* tells you what to do when lost in the woods, how to cook your grub, how to build camps and blinds, how to train your hunting dog, how to preserve your trophies, how to start a gun club, how to build a rifle range.

No book or set of books you can buy will give you the amount of up-to-date information about life in the open that you can get from a year's subscription to the *National Sportsman*. Special information furnished to subscribers at all times, Free of Charge.

SPECIAL OFFER

The 8 beautiful outdoor sport pictures, shown above, are reproduced on heavy art paper, size 9x12, in strikingly attractive colors, from original oil paintings by well-known artists. They make appropriate and pleasing decorations for the den, camp or club-room of any man who likes to hunt or fish.

We will send you this set of pictures, and the *National Sportsman* Magazine, for a whole year on receipt of \$1.50.

New York.					A. T. A. Report	

It is regretted that owing to a defective lense in *Rod and Gun's* kodak, that only a few of the numerous pictures taken at the C. N. E. Tournament came out at all clearly. However, we expect to procure a full set of photos of the various shooters in time to appear in our next issue.

Fish culture in a restricted sense must sooner or later be resorted to in all densely populated countries, for even with the utmost protection, nature unaided can do little to meet the natural demand for fish to eat.—G. Brown Goode.

JEAN STEVINSON

CHAPTER I.

I hear a story

LARSON, by all that's holy!" screamed a little wiry man jumping to his feet, "Just back from Alaska?"

"Sure thing, and on the Silvery Slocan once more."

They gripped hands, and I huddled into my greatcoat, for Larson had come in from the deck like a breath from the heaving north, and the drowsiness which had been stealing over me left with the whiff of icy wind which came from the port side of the steamer as the door swung to. The Slocan ploughed the green waters of the ice-cold lake, and with my hat pulled over my eyes I pretended to watch the timber along the mountainsides as we cut through the

curving length of the beautiful lake. I knew of Larson, for who did not in our glorious west? Could I call him by his right name you would know him, too, you who live in Vancouver, in Edmonton, in Winnipeg, for he is a big man in the west, and known wherever mines are boomed.

"Where are you off to now?" queried Larson as the two sat down behind me.

"Up into the mountains, Nakusp-Kaslo line, to look at some prospects there. And now tell me what you think you've been doing in that God-forsaken country. You don't know anything about mining yourself do you? Oh, no. Seen any pretty squaws up north this trip?"

"Sure thing." The big man looked shrewdly at the other. "Jim," he

asked suddenly, "have you got a woman yet?"

"No."

"Time you had. You get up into the north where you'll not see a white woman the year round, and you'll wish you hadn't wasted all these years."

"What's a woman got to do with mining?"

"Nothing, she's dead against the business, so I'm going to settle down in my cabin in the mountains and let mining alone. I'm not going up to Alaska again, but if you've no mind to try the settling-down business you can go up on Snake River and find Chief Kicking Horse, only he's called Jackson now. He knows where the greatest gold deposits in the north are lying, but he's as tight as a vise. I could never get it out of him."

"Then how could I?"

"Oh, you might be present at his deathbed or something like that, and do a few rites over him so he'd confess to you."

"How do you know there's gold?"

"Jackson showed it to me—lumps of it, beautiful solid lumps that would send some men crazy. 'Heaps big pile,' he said to me, 'him mine, him Hummingbird.'"

"The Hummingbird mine?" "I asked. 'What a lovely name, Jackson! Where is it?'"

"'Anah,' he exclaimed, which is always the Indian's expression of displeasure, 'Hyas Tyee go no more. Hyas Tyee hear him Skookum, hear him Diaub.'"

"'No, no, Jackson,' I remonstrated, 'there are no spooks in Alaska; there is no devil.'"

"'Tamahnous!' he exclaimed, pagan fear starting from his eyes."

"'There is no witchcraft either, Jackson,' I said."

"'Anah!' he exclaimed again, more displeased than ever, 'kopet wauwau, stop talking, white man. Hyas Tyee go no more.'"

"Nothing I could say would move him. He had told the story to two Boston men many moons before, two white men who came from the east, where gold would buy everything but happiness, and they had

plied him with hootch until he had told them all he knew. But winter, the great white spirit, was reigning over the land, and when he came to himself Jackson said they must not go. They insisted.

"'No, no,' commanded Jackson, 'Great white spirit kill, slay. Winapie, wait. When grass is green and water runs then maybe Hyas Tyee go too.'"

"They offered him money if he would take them, but he stubbornly refused. The hair seemed to move on his scalp and he muttered 'Skookum, diaub.'"

"The men, however, were in a fever to be off, and nothing could hold them. They got together pans, blankets, skin shoes, muckamuck, and started. Months afterward, while the winter still held the north in its rigid fingers, word came from an Indian runner that the two men had been found frozen to death. They were lost, and tracks in the snow showed how one had wandered around in a circle one, two, three times, in his endeavor to find his way back to the camp, and had frozen stiff standing up; his mouth open and his face tipped up as though listening, and calling 'Hello.' The wolves were gnawing at the other as he sat hunched up on his gun, frozen in an attitude of despair.

"'Gosh!' roared Jim Gates, jumping to his feet, "and that's the place you want me to go to! No, thanks. Go and tell that to the marines!"

CHAPTER II.

I go to Alaska.

I had listened grimly to Larson's story, and now, as the days passed, the question came insistently: What was to hinder *my* going to Alaska? True, the story had not been told to me; I had not been asked; but it was often the dark horse that won the race. Larson had said he would not return to Alaska, and Gates had turned down the proposition flat. Only the Indian Jackson knew about that wonderful deposit of gold, and he was so scared of some fool phantom that he wouldn't go near the place. Night and day I saw the sparkle of

nuggets, and devised plan after plan to make old Jackson give up his secret to me. Never once, however, did I dream of the way I would get it.

Even before I told myself I was really going into the north I was gathering up my old prospecting kit, getting prices on beans, bacon, evaporated potatoes and apples, tea by the hundred pounds, and flour. I owned a good L. C. Smith shotgun and a high-power Ross rifle, guns I was not ashamed to show any man, and these of course I cleaned again and got ready. Beside the firearms I packed some fishing tackle and several pairs of smoked glasses, the last because I had heard of men going snow-blind in Alaska, and knew wearing smoked spectacles was the simplest way to avoid the misfortune.

The way now seemed perfectly clear. Yet even as I said this a shadow of foreboding came like a phantom and flitted by, giving me an empty feeling in the pit of the stomach. I laughed. "Well," I jollied myself, "I've heard of cold feet, but a cold solar plexus is a new dodge."

Then I went on with my packing.

It was now the middle of May. The earth was waking to summer beauty, and only here and there was a patch of snow to be seen on the mountain sides. The pines and cedars seemed never more beautiful, though they had clothed the rounded Selkirks with green the winter through. The ice would soon be gone from the rivers in Alaska, and I decided to leave in a few weeks, as soon as I could get my affairs in the valley settled. My best route, I decided, was the C.P.R. to Vancouver, where I would get my supplies. From there I would take a steamer to Alaska, and on my arrival there would get Indian guides and strike off toward Snake River.

With my interests in various mines in the Selkirks disposed of, I boarded the C.P.R. one fine morning in June and threw all my past cares to the winds. I was free—free to roam the wide world at will. What were the joys of home, I asked, compared to freedom, to the life I was to live with the pot of gold at the end?

Of the trip to Vancouver from

Revelstoke I need not enlarge, for many have gone that way before and since. Suffice it to say, I had leisure to see everything owing to my apparent bibulous tendencies. The passengers left me alone, and I enjoyed to the full those glorious mountains and the great sweeps of black spruce wherever the eye could reach.

At Vancouver, though the great war was still going on, I had no trouble getting what I wanted providing I paid the price, and after a few days spent whipping things into shape I was on the Princess Sophia ploughing up the coast, a flock of sea-gulls darting in our wake. As I was late booking my passage I was unable to have a room to myself, but had to share with a man named Samuel Hill. He was a trapper, and told me many interesting things about forest life. He was then on his way up north, he said, to trap during the fall and winter. He looked as hard as nails, and I felt that he would be valuable to me in many ways, though his eyes were set too close together to let me repose utter confidence in him. I broached the plan of our hitting off together and he fell in with the plan readily, though he said nothing about ponying up for his share of the grubstake. Perhaps he thought I was a sucker.

"Got your grubstake?" I asked casually.

"Why no," he answered, "I was going to see to my stuff later."

"Better wire back to Vancouver then," I advised, "you'll get it cheaper there than you will further north. The Princess Alice leaves next week, and we can meet her at Skagway. We'll have to put in a few days at port anyway, hiring Indians and perhaps dogs, and we can wait until "Alice" arrives with your cargo. It's good-bye to half of our stuff anyway if we're not there to look after it ourselves."

"All right," said Sam, "just as you say."

We wired from Prince Rupert, and then settled down to enjoy the trip. We had two more days on board, and I meant to lose none of the pleasure I might take from the glories of

creations along our route. The Sophia took the inside passage through the sheltered fiords of the British Columbia coast, and past rugged, spruce-laden islands, some of them given over to different tribes of Indians who labelled their reservations, homemade cedar canoes and gargoyles totem poles.

"Look," I cried to Sam the last night on board. We had passed glaciers like rivers of ice, snow-clad peaks and volcanic mountains, and were now ploughing through Lynn Canal, where the Sophia was fated later to pile up on the treacherous reefs and then to go down with all on board. But now nothing was further from our thoughts.

"Look," I cried again, pointing to the north. Gigantic fingers of crackling light were streaking up to the dome of heaven.

"The northern lights!" I breathed, awed by the great beauty and majesty of the phenomenon, "I shall wait until they die away."

Sam went off to the stateroom, saying he was tired and would turn in for the night. I sat for awhile entranced by the beautiful play of light, then suddenly thought I would see if I could get a snap of the panorama, and went to get my camera. The throbbing of the engine beat like a great pulse through the ship, and on the soft carpets my footfall made no sound. As I quietly opened the stateroom door what was my consternation to see Hill, his back toward me, kneeling on the floor feeling carefully around in my steamer trunk. I closed the door softly and turned away, satisfied that there was no money there. But was he after money? If not, what?

CHAPTER III.

Snake River at last.

Snake River at last! Many weeks had passed since Hill and I had begun the trek with fifteen Indian runners and seventeen hundred pounds of stuff to carry. Not for nothing had I picked Sam Hill for my pard, either, though I had not forgotten the picture of his guilty back as he rummaged through my trunk that

lovely night in June. He shouldered his hundred pounds without a grunt, and many were the succulent rabbits snared on the way by his cunning hand, and many a sheep and deer we got together, for with fifteen Indians to feed beside ourselves, we had to get fresh meat on the way or curtail our sojourn on Snake river to an alarmingly short period. We also had to cache stuff along the way for the return trip of our Indians, though they would make much better time going back empty handed. And Hill could work! The glitter of gold had him as it had me, and every once in awhile, when we had stopped for a little placer mining at the mouth of a creek, the look of greed in his eye seemed to lend tireless energy to his body. I suppose he saw the same thing in me, but I did not think of that then.

We had kept moving, however, for I was anxious to strike Snake River and get a look at Chief Kicking Horse, or Chief Jackson, as he was now called.

We pitched our tent in a ravine with rocky cliffs on one side and a steep, spruce-covered slope on the other, and then went to work. It was after sundown when we stopped to get supper, for we did not want to lose a minute of the daylight.

Late at night, I was sitting on a pile of blankets in the tent, unpacking some of the stuff, and feeling at peace with the world after the good meal Sam had cooked. At the moment I had taken out my fishing tackle and the smoked glasses, which had come through a violent journey intact, thanks to my careful packing. With a short laugh at myself for bringing the glasses, I put a pair on my nose, and as I did so I became conscious of somebody watching. It wasn't Sam, for he was busy fixing a fly, a Royal Coachman, onto a piece of gut for the next day's fishing. Not a footfall had sounded in the stillness of the night, not a twig had snapped but instinctively I raised my eyes to the door of the tent, and there was the face of a red Indian.

"Klahowya, tilicum." He spoke the guttural word with dignity, yet the superstition of the dark ages

seemed to emanate from his smouldering eyes as he stood silently awaiting my reply.

"Klahowya," I saluted in return a slight knowledge of the Chinook jargon enabling me to understand that he came as a friend. "Chief Jackson?"

"Nawitka, yes," he replied majestically.

"Chief Jackson," I made answer rising, "I make you welcome. Come in."

I still wore the smoked glasses on my nose, and seeing that the big chief looked greedily and curiously at them, I took them off and handed them to him.

"Cultus potlatch," said I, "a gift."

Had I presented him with million dollars he could not have been more pleased. He was like a child with a glittering toy.

"Him good," he pronounced, and solemnly shook me by the hand. He sat on the blankets for awhile, alternately putting on the glasses and taking them off, then studied me awhile and asked:

"Boston man?"

"King George man," said I.

He grunted in approval. "King George man—good. Hunt, fish." He made a comprehensive sweep with his arm, giving me permission to do as I would in the country.

"Hyas tyee skookum," said I, "Big chief good. Thanks."

He rose solemnly and left the tent. Indeed, so silent was his going, that I looked out expecting to see him waiting at the door, but he had disappeared into the night.

A week later Sam and I were getting breakfast over the campfire. The bannocks were done brown and the bacon was sizzling in the pan, when Sam looked up at me quizzically:

"Say, pard," he drawled, "seems to me it's time for a moose hunt.

feel like two cents if I go without fresh meat for a week. I think there should be moose in that heavy clump of woods on the mountain yonder. Let's make a day of it."

"All right," said I, "you're the boss."

In half an hour, our tent fastened down, our pockets bulging with car-

tridges and cold bannocks made into sandwiches, and our rifles slung over our shoulders, we were off. We needed limbering up after a week of bending over pans and paydirt, and the tramp did us good. We had gone five miles and had done some tall climbing, when Sam said he smelled a moose. He had a nose on him like a fox, and I had learned to trust that nose where game was concerned.

"Down on your belly," he hissed, and I dropped. He slid along till he got behind a big boulder at the top of a rise, then looked stealthily down into the valley beyond. I knew by his face that he saw his quarry, and did not need the warning finger to make me lie low. I could trust Sam there. He was not only an excellent prophet regarding game, but he was a dead shot when he came up with it. This is to show that Sam, even though he could not be trusted in all things, had his good points, and mighty good ones they were, too, when you were camping as far away from civilization as we were. A sharp shot rang, out, then another and another, and I sat up suddenly. I knew one could take no chances with a moose. A wounded brute would rush you before you could say "Jack Robinson," and an unwounded one would do likewise. But two shots from Sam had always been enough, so I judged there was more than one kill. He rose and went over the rise, so I did the same and there, lying huddled together, was a young cow moose and her calf, stone dead.

"They were the loveliest couple ever," Sam said, "the calf was bunting away at its mother, and she was actually smiling at it and licking its darn sides. The old one got the first shot and swung around to protect the calf. I had to shoot her down to get the heifer. How much are we going to take back?"

"All of the calf and the best parts of the moose," said I, "We'll string the forequarters of the moose up to a tree until we have a chance to come back for it."

We set to work sticking, skinning and quartering the animals. A feel-

ing of pity came over me as the picture of the mother's protective love swam before my eyes. I do not think I could have shot her had I seen it, but Sam had no such compunctions. Perhaps, after all, his was the iron that would pay in the end.

When all was finished we shouldered nearly a hundred pounds each, and began the trudge homeward. "Nearly as bad as the portage in to Snake River," said Sam, but went on steadily with his load. "I'd like to see the dirty carcajoux tonight," he muttered grimly. The carcajou, or wolverine, was the worst pest we had to deal with in that northern country, for what it could not eat it soiled in so filthy a way that neither man nor beast, though starving, could stomach a bite, and we knew that darkness would not fall ere the animals would be at the mass of entrails we had left on the ground, and would later try to reach the good moose meat strung high on the limb of a spruce.

It was nearly sundown when we reached camp, and the first things

I saw were footprints, myriads of them, in the bank along the river.

"Whatever do you make out of this?" I asked Sam.

"Moccasins," he replied, "Indian bucks, klootchmen, papooses and dogs. What's going on, I wonder?"

"Gets me," I replied.

We had not long to wait. That night we were sitting on boxes of soap and candles oiling our guns, when once more I became conscious of eyes watching me. Glancing up, I beheld the face of Jackson again peering through the door of the tent.

"Klahowya," he saluted, but this time ignored my partner and spoke only to me. He wore the smoked glasses, though goodness knows how he found his way, for it was now dark and raining. That he was my friend I knew, and I felt that he was going to honor me in his own way for the gift of the glasses, from which he was never parted, so I rose and offered him my seat.

(Concluded in December issue)

A Nova Scotia Moose Hunt About 1840 and Another In 1918

T. S. SCOTT

WHEN I was about eleven or twelve years old, I used to read among other delightful and truly Canadian stories in Campbell's Readers, one headed with the title "Moose hunting in Nova Scotia." To a boy in an Ontario village where there had been no game bigger than an occasional hare for at least a generation, that story had a wonderful appeal. Our fathers told us that when they were boys they had seen deer and heard wolves howl as they

ran in the cedar swamps, and occasionally we ourselves would be all agog with a rumor that "a wild cat had been seen." But even our fathers and grandfathers never claimed to have seen that vast and mysterious animal called the Moose which had not been in the Country bordering Lakes Ontario and Erie in their days. R. M. Ballantyne's stories of Hudson's Bay had the true ring for a boy and even if we realized that the characters were partly ficti-

tious we still knew that the buffalo and bears, the wolves and the moose did really roam the plains and the forests, and that some boys were fortunate enough to even live in such favored districts of the Dominion.

The very name of that famous Company, old when Ballantyne wrote sixty years ago, still stirs one's imagination as the most romantic in the annals of Commerce, "Gentlemen adventurers of England Trading into Hudson's Bay." Present school books might contain more extracts from those old tales of Canada and do no harm. However, the story I quote complete was not from Ballantyne's Hudson Bay yarns but an authentic account written by Lieut. Hardy, which speaks for itself, and I have no compunction in asking *Rod and Gun* to reprint it, for it will remind many an Ontario "boy" of from 45 to 65, of the long ago, and it will be the sincerest compliment to Lieut. Hardy to give the narrative another peep of daylight. By the way, Campbell's series was published by Wm. Warwick (opposite the market), Woodstock 1867, not far I suppose from where *Rod and Gun* itself now sees the light of day. Here is Lieut. Hardy's yarn:—

"About three hours before sundown we all left the camp; my companion, with old Paul, going down the lake in a canoe, whilst the two young Indians accompanied me through the woods to "Still Water," a stagnant, muddy stream, flowing into the lake through swampy fir-wood. The "dark valley" through which it passed was thickly carpeted by wet moss, the numerous impressions on which showed that it was a favorite resort for moose. As there was still an hour's daylight, we commenced to "creep." Presently Joe, stooping down and examining a track with unusual earnestness, beckoned to his comrade.

"Quite fresh track, two bull and cow; they gone by just ten minutes," pronounced Joe. "See here," said he, bending down a young maple shoot bitten off at about ten feet from the ground, "see where he make the fresh bite."

It was evidently cropt quite re-

cently, for, on breaking it off, an inch lower down, no difference in color could be perceived between the fracture and where the moose had bitten it.

"I think you put on cap now," said the Indian, "no tellin' when we see um moose now."

Now begins the creeping in earnest, Jim taking the lead and we following, noiseless as snakes, in Indian file. Suddenly, a distant sound strikes our ears, and we stand listening in our tracks! It is repeated—a wild roar—and appears to come over the hill to our left.

"The moose!" said Jim, and, clearing the swamp, we dash up the hillside, the energetic waving of Jim's hand, as we arrive at the summit, warning us to exercise our utmost caution. Yes! he is right. The brutes are in the valley beneath, and the forest echoes with the deep guttural bellowings of the antlered monster, and the plaintive answers of his consort, yet we in no way relaxed our former caution. We could not depend for any mistake on our being concealed by the tremendous uproar of the moose, and our course must still be shaped with due observation of the wind. We descend the hill obliquely to the edge of the "Still Water," across which the moose had just swum. We, too, cross the water on a dead trunk that has fallen from bank to bank, and, tightly grasping our guns, crouch down and endeavor to penetrate the thickets ahead for a sight of the game. Suddenly and unexpectedly we leave the dense underwood, and stand on the edge of a little open valley. Jim, as I emerge from the thicket immediately after him, bounds on one side, his arm extending and pointing. There is an enormous black mass standing behind a group of young maples at the further end of the valley. It is the bull. In a second the sight of the rifle bears upon him, and uttering an appalling roar, the huge brute sinks plunging into the laurels.

With a shout we rush on! To our astonishment, however, he rises with another fearful roar, and, before I have time to check my speed and

level the rifle once more, he has disappeared through the thicket.

"Come on," shouts Jim, "we sure to get him—he badly hit.—" There is no tracking now; the crashing branches and the roar of the enraged animal direct us, and we dash through swamps, and bound over fallen trees with desperate energy. But it is of no use; the pace was too good to last, and presently, torn and exhausted, we flung ourselves at full length on the moss, and for a while listened to our own deep breathings, and to the hoarse bellowing of the rapidly retreating moose, momentarily growing fainter. Joe, the youngest Indian, a lad of extraordinary endurance, had taken my rifle and renewed the chase by himself.

After a while, however, Joe was seen returning, and without saying a word flung himself down by the side of his companions, quite done up. They did not ask him what luck he had, there it was, plain enough—a piece of moose-meat tied to the barrel of his gun. The particulars of the chase did not come out till the day's sport was over, and master and men reclined at their ease in camp.

"When I leave you," exclaimed Joe, "I run very hard for 'bout a mile; moose make great noise—I know he very sick; and soon when I come up on little barren I see um standing on other side. Oh, my sakes! He got such a bad cough! He not able to hold up his head. Then I shoot, and he run little piece further and drop. You want to know where you hit um? Well, I tell you, you hit um in the neck—make him cough shocking."

Now you old Ontario codgers, doesn't that take you back from 35 to 50 years? It does in my case and my sub-conscious memory always has registered Nova Scotia and moose together. In 1918, I was transferred from Kingston to Halifax, but had little expectation of being there during the shooting season, so left the old rifle in Kingston. However, time wore along toward fall and prospects of getting overseas looked not very immediate, so about the 1st of September I sent for the rifle.

Away down in my mind where hunches grow, something seemed to

say that now I was in the old school book land of dreams where that fellow shot the moose, and that if I went out I'd get mine.

I was able to get leave most easily in September which was convenient as that month and early October are said to comprise the calling season, and I wished to witness that system of hunting, which there is little doubt has had its greatest development in the Province of Nova Scotia. I did "still hunt moose" late one Fall in Temagami, Northern Ontario, but got no shooting, seeing only one cow.

This time limit resulted finally in putting me in the class of the big game hunters. None of the other friends of the owners of the hunting lodge to which I had an invitation could get away, so I was out on my own and felt as independent as Selous or Pritchard or our own lovable American hunter Teddy Roosevelt.

My old hunting friend "Matt" who prowled the Valdez Islands, B. C. after black tail deer many a fine November day with me was urged to come but much to his regret he couldn't make it. He was no further off than New Hampshire and I had hopes, but business prevented.

We had a lot of rain in September but when the 20th came round I hoped for a good streak

I didn't have much to take as the camp was said to be well equipped as to bedding so my old B. C. pack sack was only part full. I took only my rough clothes, a touch of usquebagh "in case I got my feet wet" and a few pounds of breakfast bacon. I was advised that there were two good country stores at the jumping off place where I could get necessities.

My railroad trip was short, only about 45 miles along a recently built road, starting from Dartmouth across the harbour from Halifax. This road runs east and along the shore and then north-east into the Musquodoboit valley to the present terminus called Steward after the proprietor of the very good hotel.

Before breakfast next morning I got my list of groceries in the hands of the storekeeper. Mr. Stewart provided me with a horse and buggy

and a driver in the person of one of his sons, home on a short leave from Aldershot. After breakfast we picked up the groceries—enough for the guide and myself for a week. It was necessary to take plenty because there is a close season on grouse, which had been almost killed out in Nova Scotia. Anyway it's not good practice to shoot much round camp and expect to get moose.

Away we went on a 16 mile drive along the stage road toward Sheet Harbour. The road is no worse than other Nova Scotia roads, about what the traffic warrants, but could be improved by keeping the side ditches open. We had a big powerful horse and a light load so got to camp before noon to find smoke—wood smoke—cheerfully rising from the chimney. Con Richards the guide, had walked from his little farm 4 miles beyond, an hour or two earlier to get the wooden shutters off and the fire going.

This is a cosy little two room lodge. I confess that I am fond of a comfortable camp and it's no sign of a tender-foot. Let those rough it who like it, and nine times out of ten it's only a bluff when they say they do. I've roughed it when I had to, but not by preference. Con and I got a little acquainted over a good dinner after which Corpl. Stewart headed home and Con and I struck out about one o'clock to look things over. No doubt too the guide wanted to look me over to see if it was hopeless or not to think of getting me through the woods and swamps within range of a moose.

Truth to tell I'm not as light as I was 25 years ago by 40 pounds and then I weighed 165. However, Con though slim, is older than I am and I believe his little extra load of years just about balanced my excess avoirdupois for we mouched along for the next five days with ever growing satisfaction and esteem.

We wore shanty rubbers with fairly flexible soles and two pair of heavy woollen socks. This foot gear is pretty quiet and more satisfactory in wet ground than moccasins. I soon decided this was the easiest forest country to travel that I had

ever tried. Of course Richards knows all the trails but in some forest country there are almost no trails to know, while here the place is cobwebbed with old logging roads and no windfalls as we know them in the West where you just have to go round them.

We were encouraged by seeing a fairly fresh track on a tote road along which we went about 2 miles. We found out next day from a prospector that this was made by a full grown cow moose which had fallen into a deserted mine excavation some miles north on the same road. He and his partner discovered her. They broke down the side of the bank with pick and shovel while she waited peacably within a few feet of them standing in about five feet of water. As soon as the slope was ready the two men stood aside and she climbed out.

The prospector told me, and it was the part of the story that he emphasized most, that when she got well out and a few steps away she stopped and looked back toward them in a kind of friendly, thankful way and then went off slowly as if exhausted. He thought she had been there a day or two and had struggled desperately.

It was the look she gave them that impressed him. He said he had seen her track off and on as he came along all the way from the mine. However, this first afternoon we struck last a bit along a narrower trail and saw nothing except a most independent porcupine round some deserted lumber camps. Richards called but with no result. The country is ideal moose country, a succession of hardwood ridges and spruce bottoms interspersed with "barrens" of from a quarter of an acre to a hundred acres, beautiful clear streams and still swamps. The camp is between the stage road and a river which we had crossed by a wooden bridge. In regard to moose calling, of course one has to be in the proper setting to appreciate it. The birch bark horn is really a makeshift megaphone. The imitation of a cow moose call is not altogether unlike the call of the domestic cow. You will note I say the "imitation" as I never heard a

cow moose call, and I have of course heard many a domestic cow calling for a mate, when the call is different from the ordinary lowing. I did hear a moose, said to be a bull, call, one night in Northern Manitoba but it was distant and again not unlike a domestic bull heard in a wooded river valley as I have heard it.

The call as rendered by Richards had a certain indescribable wildness which made it different from that of the domestic cow which it still resembled and was sufficiently true to nature to quite deceive an experienced moose hunter on a following day who was patiently stalking us for a while.

This first afternoon was inclined to be showery and the wind got up. The forest is no place to be, in a high wind, but though we heard some crashes and saw several down trees on our way to camp we arrived before dark only a little wet. There is a lot of difference of opinion as to calling. Some say you can't successfully call on windy days or in the day time. Truth is no doubt, that an art like this was unlikely to be recorded. The best exponents often could not read or write and the few living successful moose callers don't bother to set down the facts and all the circumstances.

Richards is like Harry Lauder who says "Man you should have heard me sing when I could sing." Con says he doesn't call as well as he did and told me moreover of very successful rival moose hunters in his younger days who couldn't or wouldn't call at all but who ranged the ground like wolves covering mile upon mile. You have to be in special condition to enjoy that or even to stand it. I found it a wonderfully pleasant system after exhausting the possibilities of one swamp or barren and walking quietly a mile or so to the next, creeping the last portion quietly, to sit down restfully and hear Con's call rise, varying from a mellow quality sometimes to a certain hoarseness and die down with a queer little coughing grunt. Then sit absolutely still and listen, just listen with all one's mind as well as sense.

The second day Con packed his knapsack with some lunch. We

didn't start before daylight at all, as there had been a heavy rain during the night and the woods were soaking. We turned off the tote road/sooner and hunted in some bottoms, trailing what Con said was a cow and calf. We saw some "works," that is brush with bark scrubbed off but it was old. It was here, in calling, that Richards fooled the other fellow.

The third day we crossed the stage road and hunted south of it. This was a scrumptious day to be in the woods. Cold to start but just right about 8.30. It was glorious to sit at the edge of a barren and listen to the call. It was very bright and still, the hardwood ridges showed lovely coloring of russets and yellows but with less bright reds than the Ontario woods. I heard what I thought was an answer once when we called from a beech and maple ridge near lake Alma. We waited quite a while and finally went on down to the lake for lunch. We saw several loons and decided they had made the noise. After lunch we picked up a rather small but very fresh track and trailed it back quite close to where we had called and Con was sure his seductive voice had been responsible and that we should have waited longer.

Working back toward camp we found a very fresh track of a cow which Con undertook to show me but finally gave it up after creeping a while. The swamps were pretty full and it was getting toward dark.

The fourth day the guide was on his mettle, I told him I wouldn't break my heart if I didn't get a moose. The weather was fine and I just like to hunt. We had covered the ground although so comfortably yet mighty thoroughly. Richards seemed to know every little trail and to go from one likely spot to another with the least travel, and quite reasonably he should as he had lumbered and trapped the ground boy and man for forty years and still he just likes to hunt and to show you game.

We went along the stage road a couple of miles and then struck north toward the river. We "called" at

the edge of a big barren with no response.
